Following the occupation of Naples (by the 5th army) on Oct. 1, while the 5th army continued to advance northward to the west of the Appennines, the 8th army advanced to the east of them until in May, 1944, the bulk of it was transferred westward to take part in the final battle of Cassino (q.v.) and the capture of the Gustav Line. It continued to fight through the mountainous backbone of Italy and up the east coast, occupying Florence and breaking the Gothic Line in Aug., capturing Rimini in Sept., Ravenna in Dec. In April, 1945, it helped to take Bologna, and, crossing the R. Po in an encircling movement, trapped the main body of the German army S. of that river. It entered Trieste on May 2 and received the surrender of the German commander; crossed into Austria on May 7. It was disbanded July 29, 1945.

### Commanders of the Eighth

When Montgomery left Italy in Jan., 1944, to prepare for the invasion of N. France, Lieut.-Gen. Sir Oliver Leese took over command of the 8th army. Transferred to S.E. Asia in Nov., 1944, he was succeeded in the command of the 8th by Lieut.-Gen. Sir Richard L. McCreery. Few armies in British history have captured the imagination of the world as did the 8th. Under Montgomery's inspiring command, it achieved successes scarcely equalled on any other front. By moving among the men, Montgomery made himself personally known to them; before major battles he explained to them the principal objects of his strategy—unusual characteristics in a general which helped materially in creating the sense of unity that was the 8th army's strength.

During the fighting in N. Africa the 8th army was composed in the main of British and Empire formations. These included at

different times the 7th armoured division (called Desert Rats from their divisional flash, a jerboa), the 51st (Highland) division, the 50th (Northumbrian) division, the 44th (Home Counties) division, the New Zealand 2nd division, the 4th Indian division, the Australian 9th and the S. African 1st divisions. Canadian, Polish, Italian, Greek, and Brazilian units served with it in Italy.

**Eights Week.** Popular name at Oxford for a period which includes a series of bumping races for college boats—the Oxford Summer Eights. The week begins on a Thurs. in May and ends the following Wed. Usually several crews are entered by each college and the races are rowed in divisions throughout each afternoon except Sunday. Eights Week is a social occasion in the university; with it are associated concerts and entertainments apart from the picturesque scene on the river.

**Eighty Club.** British political club. It was founded in 1880 to celebrate the victory gained by the Liberals at the general election of that year, its main object being to unite the younger members of the Liberal party and to encourage them in active political work. A president, usually a leader of the Liberal party, is elected annually. Women members were admitted in 1920. The club's headquarters are at 36, Victoria St., London, S.W.1.

**Eijkman, CHRISTIAAN** (1858–1930). Dutch pathologist. Born Aug. 11, 1858, at Nijkerk, Gelderland, he became an army surgeon. He took part in 1886 in a scientific expedition to the East Indies for an investigation of the beri-beri disease, and was made director of the pathological laboratory at Batavia, where he stayed until 1896. Here, by the experiment of feeding one hen on polished rice, another on unpolished, he established that beri-beri was due to a deficiency of some substance (later identified and named vitamin B1) which is present in the husk of rice grains. With F. Gowland Hopkins (*q.v.*) he was awarded the 1929 Nobel prize for physiology and medicine. As professor of hygiene at Utrecht from 1898 to 1928 he devised a process for detecting the bacillus coli in water. He died Nov. 5, 1930.

**Eikon** (Gr., image). Holy image or sacred picture used in the worship of the Greek Church, more usually spelled Ikon or Icon (*q.v.*).

**Eikon Basilike** (Gr., royal likeness). Book purporting to be written by Charles I, and published

immediately after his execution, although most of the early editions bear the date 1648. Its sub-title is *The Pourtraicture of His Sacred Majestie in His Solitudes and Sufferings*. It professes to give the king's views of the events of his reign, and a number of his prayers. Milton, in *Eikonoklastes*, replied in detail to the work and first hinted at doubts as to its authorship. Historians take sides for Charles or for John Gauden, later bishop of Worcester, who claimed to have written it. There are editions by C. M. Phillimore, 1879; and E. Almack, 1904; consult also *Bibliography of the King's Book*, E. Almack, 1896.

**Eil.** Sea-loch between Argyllshire and Inverness-shire, Scotland. Forming a W. extension of Loch Linnhe, it is 8 m. long and has a mean breadth of  $\frac{1}{2}$  m.

**Eildon Hills.** Range of hills in Roxburghshire, Scotland. Situated S. of Melrose, they rise into three peaks, the highest of which is 1,385 ft. On the slopes are a supposed Druidical tumulus and remnants of a Roman encampment. According to popular tradition, the single hill was split into three by the "wondrous wizard," Michael Scott of Balwearie.

**Eileithyaspolis** or **EILEITHYIA**. City of ancient Egypt. It has been identified with the present El Kab, on the E. bank of Nile, 44 m. above Luxor. The goddess of the town, Nekhet, was regarded by the Greeks as identical with Eileithyia, the goddess of childbirth, hence the Greek version of the Egyptian name (Nekhab) of the city. The ruins are extensive.

**Eilenburg.** Town of the German province of Saxony. It stands on the left bank and an island of the Mulde, 15 m. N.E. of Leipzig, and is a rly. junction. It is a centre of the textile industry, and also manufactures chemicals, pianos, furniture, and agricultural machinery. The castle, after which it is named, dates from the 10th century, but the town, known earlier as Ilburg, is older. It was part of Meissen and then of Saxony, in which it remained until given to Prussia in 1815. Pop. (pre-war) 19,500.

**Eimeo.** One of the Society Islands in the Pacific Ocean. It lies to the N.W. of Tahiti, in lat. 17° 32' S. and long. 150° 2' W., and is a French possession. It is 9 m. long and 5 m. broad; area, 51 sq. m. The London Missionary Society has a station and a college on the island.

**Einaudi, LUIGI** (b. 1874). Italian president. See N.V.

**Eindhoven.** Town of the Netherlands, in North Brabant. It lies 8 m. W.S.W. of Helmond and is a rly. and an important road junction. With fewer than 5,000 inhabitants in 1900, it developed into an industrial centre and became the seventh town of the Netherlands, with a population of 111,179 in 1939. A centre of the electric bulb industry, it has also radio, textile, and tobacco manufactures.

In the Second Great War it was frequently attacked by Allied bombers: the radio factory there, the largest of its kind in Europe, was an important source of supply for the German army. The U.S. 101st airborne div. was dropped between Eindhoven and Grave on Sept. 17, 1944, in connexion with the attempt to make an airborne crossing of the Lower Rhine (see Arnhem, battle of). The British 2nd army reached the airborne forces and liberated Eindhoven, first large Dutch town to be freed, next day. The Luftwaffe bombed the town on the night of Sept. 19–20.

**Einhard, or EGINHARD** (c. 770–840). Frankish historian. Born in East Franconia, he was educated at the monastery of Fulda and at the court of Charlemagne, where he was a pupil of Alcuin. He was made secretary and superintendent of public buildings by Charlemagne and was responsible for the royal palaces at Ingelheim and Aix-la-Chapelle. He continued to enjoy favour under Louis, Charlemagne's successor, who entrusted him with the education of his son Lothair, and in 815 bestowed on him the domains of Michelstadt and Mülheim. In 827, unable to compose the quarrels between the emperor Louis and his sons, Einhard retired from court to Mülheim, where he founded a monastery, and died March 14, 840. His wife was Emma, sister of the bishop of Worms, and not a daughter of Charlemagne, as later legends represent. His chief works are his *Epistolae*, and his *Life of Charlemagne*, one of the best biographies of the Middle Ages, and the source of most of our information about the great emperor (Eng. trans. A. G. Grant, 1905; H. W. Garrod, 1915). His authorship of the *Annales Regum Francorum* is disputed.

**Einsiedeln.** Town of Switzerland, in the canton of Schwyz. It stands on the Albach, 2,908 ft. above the sea, 23 m. by rly. S.E. of Zürich. One of the most famous pilgrim resorts of the world, it owes its importance to the great

Benedictine monastery, containing a miraculous black wooden image of the Virgin. The abbey was founded in 934, but rebuilt in the 18th century; the French sacked the place in 1798, but the treasury and library, with 50,000 vols. and valuable MSS., still contain many precious objects, portraits, etc. Thronged in the Middle Ages, it still attracts thousands of pilgrims annually. Zwingli was a parish priest here.

**Einstein, ALBERT** (b. 1879). German-born American physicist. He was born at Ulm, March 14, 1879, of Jewish parentage. His school days were passed at Munich, which he left at 16 to pursue his studies at the Zürich higher technical school (1896-1900). In 1901

Albert Einstein,  
American physicist

Einstein was naturalised as a Swiss, and accepted a post in the patent office at Berne. While here he published many scientific papers dealing with such subjects as the Brownian movement, the "quantum" theory of energy, and, what attracted the greatest attention, the theory of relativity (q.v.). In 1905 Einstein formulated his own theory of relativity in its narrower or "special" form, and this formulation at once raised him to a high place among European scientists. In 1909 he was appointed professor at Zürich, and in 1911 he left Zürich for Prague, where he was professor of physics in the German section of the university.

In 1912 Einstein returned to Zürich as professor at the technical university and in 1914 went to Berlin as a member of the academy of science. In 1915 he caused a sensation in the scientific world by his explanation of gravitational attraction, based on the wider or "general" form of his theory of relativity, and accompanied by an explanation of the anomalous motion of the planet Mercury. He then made a remarkable prediction as to the bending of light rays from the stars which passed close to the sun; the verifying of this prediction by the British solar eclipse expeditions in 1919 made Einstein world famous.

His position in the world of science became ever stronger, and he was widely ranked with Newton among the world's thinkers. He was elected a foreign member of the Royal Society in 1921, and

that year was awarded the Nobel prize for physics. The publication in 1929 of two papers on a united field theory marked an important step in the application of the theory of relativity to the province of electro-magnetism. Einstein was abroad when the Nazi regime was set up in Germany, and in view of the persecution to which Jews were exposed he refused to return to the country of his birth, publicly renouncing his allegiance. All his property was confiscated. He retired to England, where he remained in semi-secrecy, but made public appearances at mass meetings against Nazi persecution. He later went to the U.S.A., where he was professor of theoretical physics at Princeton, becoming an American citizen 1940. He made public his generalised theory of gravitation in Dec., 1949.

Einstein's books are written in German and are extremely technical. The most popular of them, however, was translated into Eng-

lish as *The Meaning of Relativity* in 1922. His other works include *Why War?* (with S. Freud), 1933; *My Philosophy*, 1934; *The World as I See it*, 1935; *The Evolution of Physics* (with L. Infeld), 1938. *Consult Einstein the Searcher*, A. Moszkowski, 1921; *Lives*, A. Reiser, 1931; D. Reichinstein, 1934; H. G. Garbedian, 1939.

**Einthoven, WILLEM** (1860-1927). Dutch physiologist. He was born May 21, 1860, at Samarang, Java, and educated at Utrecht. Professor of medicine and physiology at Leiden from 1886 until his death, Sept. 28, 1927, he specialised in devising methods for exploiting electricity in diagnosis of disease. In 1911 he invented a string-galvanometer, the basis for the electro-cardiograph. In 1924 he was awarded the Nobel prize for physiology and medicine in recognition of the great progress made through his inventions in the treatment of heart diseases.

## EIRE: A BRITISH ISLES REPUBLIC

N. Mansergh, D.Phil., Author of *Britain and Ireland*, etc.

*This article deals with that part of Ireland which became known as the Irish Free State in 1922, and as Eire in 1937. Its physiography and geography, and the history of the whole island up to 1922, are given under Ireland. For the history of Northern Ireland since 1922, see Northern Ireland. See also Irish Republican Army; Sinn Féin, etc.; and Collins; De Valera; Griffith, etc.*

Eire is 17,024,485 acres in area. In 1944 about a third of this area was under crops. The principal produce was wheat 546,114 tons; oats 779,820 tons; and barley 152,536 tons. Livestock included 4,245,936 cattle and 2,663,062 sheep.

The population in 1946 was 2,953,452. The density of population is 111 per sq. m. The principal cities are Dublin, the capital, Cork, Limerick, and Waterford.

**RELIGION.** According to the 1936 census there were 2,773,920 Roman Catholics; 145,030 Church of Ireland; 28,067 Presbyterians; 9,649 Methodists.

**COMMUNICATIONS.** Rail and road communications are good. In 1944 there were 2,493 miles of railway. Main lines under the Córas Iompair Éireann radiate from Dublin to Cork, Limerick, Galway, and Waterford. There is also the Great Northern rly. line from Dublin to Belfast.

The principal harbours are Dublin, Cobh, Dun Laoghaire (Kingstown), Cork, Galway, Rosslare, Limerick. Cross channel services run regularly between Holyhead and Dun Laoghaire; Liverpool and Dublin; Fishguard and Rosslare. Waterford and Cork.

There is also a regular service by aeroplane between London and Dublin airports. From Shannon airport (Rineanna) and Foynes, a seaplane base, trans-Atlantic services are operated.

**HISTORY.** The Anglo-Irish Treaty, signed on Dec. 6, 1921 (see Ireland), ratified by the parliament of the United Kingdom on Dec. 16, and by the elected members of the parliament (dáil) of Southern Ireland on Jan. 15, 1922, brought a new dominion into being. This new state was the product of a compromise between the policy of the British government, defined by Lloyd George as that of ascertaining "how the association of Ireland with the community of nations known as the British Empire can best be reconciled with Irish national aspirations," and that of the Irish nationalist-republican leaders, who maintained, in De Valera's words, that "Ireland's right to choose the path she shall take to realize her own destiny must be accepted as indefeasible. . . ." The compromise was reached because both sides were determined to put an end to the internecine warfare which had ravaged Ireland; but for both it represented

a very considerable concession. Churchill, who was one of the British delegates at the conference, later described the negotiations and the treaty which emerged from them as "one of the most questionable and hazardous experiments upon which a great empire in the plenitude of its power has ever embarked." In Ireland the treaty, welcomed since it brought hostilities to an end, came to be regarded as a concession extracted by force from a war-weary oppressor. These contrasted interpretations of the document which brought the Irish Free State into being had important consequences for the future of Anglo-Irish relations.

#### Irish Free State Established

The underlying principle of the settlement of 1921 was the grant of dominion status to the Irish Free State. No precise definition of dominion status was embodied in the treaty, but it was therein provided that the new state was to have the same status in the British commonwealth of nations "as the dominion of Canada, the commonwealth of Australia, the dominion of New Zealand, and the union of South Africa with a parliament having powers to make laws for peace, order, and good government and an executive responsible to that parliament. . . ." To allay Irish misgiving, very particular reference was made to the dominion of Canada, as the senior dominion, and the practice and constitutional relationship between Britain and Canada were the pattern to be followed in relations between Britain and Ireland. This was a very considerable safeguard since, as Lloyd George said, any attempt "to encroach" upon the rights of the Irish Free State would make the overseas dominions each feel that "its own position is put in jeopardy."

There were two clauses in the treaty, one dictated by considerations of politics, the other by geographical factors, over which controversy arose. The first was article 4, which provided that an oath was to be taken by all members of the Free State parliament swearing "true faith and allegiance to the constitution of the Irish Free State as by law established" and faithfulness "to H.M. King George V. . . in virtue of the common citizenship of Ireland with Great Britain and her adherence to and membership of the group of nations forming the British Commonwealth." The other, art. 7, based on the con-

ception of the strategic unity of the British Isles, allowed for the partial maintenance of British naval control over Irish coastal defences. In time of peace, the Irish Free State agreed to afford to the British forces specific harbour and other facilities, whilst in time of war or strained relations these facilities might be extended to anything required for defence purposes by the United Kingdom government. It was in accordance with the terms of this article that the Royal Navy used the treaty ports of Cobh, Berehaven, and Lough Swilly until the agreement of 1938. These two provisions were the principal target for republican critics of the treaty. Their positive solution as defined by De Valera was not dominion status and all that it implied, but the external association "of the Irish republic with the British Commonwealth."

The negotiations with Britain, in the first instance conducted by De Valera, had been concluded by the Irish delegation which went to London. Arthur Griffith and Michael Collins were its leaders. When the terms of the settlement they had negotiated were published on Dec. 6, 1921, De Valera announced his opposition. In the dail, opinion was evenly divided and after a protracted debate the treaty was approved by a majority of only seven; 64 votes being cast in favour, 57 against. De Valera thereupon resigned and Arthur Griffith was elected president in his place by the narrow margin of two votes.

#### Division in Sinn Féin

While there is no doubt that opinion in a country weary of warfare was more favourable to the treaty than opinion in the dail, there was no disguising the reality of the gulf that divided the ideological republican wing of the hitherto united Sinn Féin party from the "free staters" led by Collins and Griffith. The former, under the leadership of De Valera, maintained that the republic proclaimed in 1916, ratified by the first dail in 1919, was the only form of government that could be accepted; that any compromise on this supreme issue was a dishonourable betrayal of national rights. To this doctrinaire denunciation of all compromise, Griffith and Collins replied by pointing to the great constitutional advance which the treaty recorded and the solid benefits which it conferred on Ireland. But the issue thus raised divided the Irish people too deeply to be

easily settled by argument, even though determined efforts were made to paper over the cracks. The most important of these efforts was the agreement between the two opposing parties to put forward a joint panel of candidates at the general election to be held on the treaty issue with a view to reproducing the distribution of strength in the existing dail. The device failed to achieve its object, because Labour and other smaller parties decided to put forward candidates. Of these non-panel candidates, 34 were elected, all in favour of the treaty. The defeat of the republicans was thereby made as evident as the fact that they were not prepared to accept the verdict of the polls as final. The majority, in De Valera's view, had "no right to do wrong."

#### Outbreak of Civil War

Civil war was the sequel. Its outbreak may be dated from June 28, 1922, when the leaders of the dissident forces of the old I.R.A., who refused to obey the orders of the provisional government of the Irish Free State, were besieged in the Four Courts. The fighting in Dublin was not prolonged; but despite defeat in the capital, the "flying columns" of the irregulars sustained a protracted resistance in the provinces, particularly in the south and west. On March 23, 1923, De Valera and Frank Aiken, the republican chief of staff, called on their followers to cease hostilities; but more than a year was to elapse before order was fully restored. Though the casualties on either side were not heavy, the bitterness and the ruthlessness associated with civil wars were all too evident. Of the former Sinn Féin leaders, Arthur Griffith died on Aug. 12, 1922, his spirit broken by the coming of "fratricidal strife"; and Michael Collins was killed in an ambush in co. Cork on Aug. 22 of the same year. Many of the principal republican leaders, including Erskine Childers, were executed either by order of the provisional government or later by that of the government of the Irish Free State.

Plans for the future government of the new state were not wholly interrupted by the civil war. Shortly after the ratification of the treaty by the Irish parliament, a committee under the chairmanship of Michael Collins was appointed to prepare a draft constitution. Its conclusions were embodied in a constitution bill submitted to the constituent assembly

by W. T. Cosgrave, who succeeded Arthur Griffith as president on Sept. 18, 1922. Considerably amended, this constitution was brought into operation on Dec. 6 of the same year by proclamation. Its provisions determined the form of government of the Irish Free State until 1937.

#### Terms of the 1922 Constitution

The constitution established a legislature of two houses: the senate and the dáil. The former, elected first by the suffrage of all citizens over 30, and later by indirect election, had a membership of 60. The dáil, whose membership is determined on a population basis, had in the first instance 153 members, as against 138 in 1944. The cabinet, termed the executive council, was made responsible to the dáil. The governor general acted as the representative of the crown. The remaining provisions of the constitution conformed to the accepted pattern of advanced representative government with certain experimental innovations which, *inter alia*, allowed for the appointment of "extern" ministers and the use of the referendum. These innovations for the most part proved of little practical value.

It was laid down that the provisions of the constitution should be construed with reference to the treaty. If any provision conflicted with the treaty, it was for that reason declared to be "absolutely void and inoperative." This "repugnancy clause," as it was termed, which accorded the highest legal authority to the treaty, helped to keep it very much in the arena of party politics. Partly to offset unique legal status thus vested in the treaty, national sovereignty was reasserted in the provision "that all lawful authority comes from God to the people," and at the same time, in order to underline the continuity of the dáil's authority from the revolutionary assembly of 1919, the first dáil elected under the constitution was called the third dáil.

The constitution enacted, the principal task confronting the government was the restoration of public order and the creation of a settled administrative, social, and economic system. Hitherto Irishmen's experience in the art of self-government had been confined largely to the field of local politics. The lasting achievement that stands to Cosgrave's credit is that with patience and inflexible purpose he laid firm foundations upon which a democratic system

of government was established. To assist him in his task he selected as colleagues on the executive council young men, mostly unknown at the time of their accession to office, but in the course of years to acquire a high and well-deserved reputation as efficient and enlightened administrators. Among them were Kevin O'Higgins, the vice-president of the council, Patrick Hogan, minister for Agriculture, Ernest Blythe, minister for Finance, P. McGilligan, minister for Industry and Commerce from 1924. T. M. Healy, K.C., was appointed the first governor general.

The Irish Free State comprised 26 out of the 32 counties of Ireland. This was in effect a recognition of the status quo, because the Government of Ireland Act, 1920, had divided the country into its two parts. Under the terms of the treaty, Northern Ireland was given the power to opt out of the Irish Free State within a month of its ratification. This was duly done, but though the unity of Ireland remained for the moment an impracticable ideal cherished by "free staters" and republicans alike, the exact delimitation of the boundary remained in suspense. Art. 12 of the treaty had provided that, if Northern Ireland decided to remain outside the Free State, a boundary commission should be appointed "to determine in accordance with the wishes of the inhabitants, so far as may be compatible with economic and geographical considerations, the boundaries between Northern Ireland and the rest of Ireland."

#### Boundary Compromise

The boundary commission was appointed in due course in 1924, but before its conclusions were published the Free State representative, Professor Eoin MacNeill, resigned. It had been generally anticipated in Dublin that the loosely worded directive embodied in art. 12 would permit of adjustments of the boundary in favour of the Irish Free State. When it was understood that these hopes were not to be fulfilled, passions were aroused and Professor MacNeill followed his resignation from the commission by resigning from the executive council as well. Momentarily the position of the government was made very difficult. Ultimately, however, a compromise solution was reached in London by which the boundary remained unchanged, but the Irish Free State's liability

for a fair share of the public debt of the United Kingdom as it stood in 1921 was cancelled. The agreement was carried only after being subjected to bitter criticism in the dáil.

After the election of 1923 the Cosgrave party, known as Cumann na nGaedhael, remained in a strong position; but this was partly due to the abstention of De Valera's followers, 39 of whom were elected, but all of whom declined to take their seats. Their abstention was due to the oath to which reference has already been made and to which all members of the dáil had to subscribe before taking their seats. The opposition in the chamber was therefore provided principally by the Labour party and in lesser degree by the Farmers and Independents, all of whom were pro-treaty. In the senate, the government was likewise in a strong position, the more so in that the provisional arrangements for its composition allowed for a high proportion of nominated members. It was by using this power of nomination in their favour that the government was able to some extent to reconcile ex-unionists to the new regime.

#### Cosgrave's Administration

The early days of the Cosgrave government were devoted to retrenchment and reform. The financial position required to be stabilised, and this involved heavy taxation and some reduction in social services, the most notable of which was the decrease in old age pensions from 10s. to 9s. in 1924. These measures did not enhance the popularity of the government with the electorate; but they made possible a more forward policy after 1925. In the early years, too, the administrative reorganization alone was a formidable task, and to it was added the thorough reconstitution of the judicial system.

The government had inherited from the Sinn Féin movement a not uncritical faith in the doctrines of economic nationalism, one aim of which was to be independent of English manufactures. The growth of industry was encouraged where necessary by the imposition of tariffs. The budget of 1924 imposed, *inter alia*, duties on sugar, confectionery, boots and shoes, and on glass bottles. It was a tentative experiment in protection which was judged to have been sufficiently justified by its results to be extended in 1925. Duties were then imposed upon clothing and

blankets, bedsteads and wooden furniture. The amount of the duty varied from 15 p.c. to 33½ p.c., and succeeding years were to see a gradual extension of these protective tariffs until a wide range of manufactured articles was covered by them. The other side of the picture was to be found in the positive encouragement given to local industry by the payment of subsidies and the provision of cheap credit facilities.

The goal of economic self-sufficiency was a distant one, but certain notable steps were taken to bring it nearer. Two state-aided enterprises on which the government embarked had ultimately a far-reaching effect upon Eire's economy. The first, and the more modest, was the subsidised sugar-beet factory established at Carlow. This proved outstandingly successful and was to be the forerunner of an extensive sugar-beet industry which, by 1940, was to make Eire virtually self-supporting so far as sugar was concerned. The other, and more important, enterprise was the Shannon hydro-electric scheme, designed to provide the Irish manufacturer with a cheap and convenient source of power. This great enterprise, carried out by Siemens-Schuckert, harnessed the water power of the Shannon to the material benefit of industry and of the community in general.

#### Agricultural Reforms

While the Cosgrave government fostered the growth of industry, its principal concern was agriculture, always the foundation of Ireland's economy. Many reforms directed to its improvement were carried through under the active direction of Patrick Hogan. Measures were taken to ensure the more efficient marketing of Irish products overseas; to improve the quality of her livestock by better breeding; and to ensure that agricultural land was used to better advantage. Many of the reforms were expressly designed to help the small farmer. The Land Act of 1923, an important measure, completed land purchase and aimed at relieving congestion. Under its provisions wide powers were given to the land commission to acquire untenanted land for this last purpose.

The general election of June, 1927, was the first held under normal conditions. Despite its solid administrative achievement, the government lost considerable ground. Cumann na nGaedhael lost 11 seats, its strength in

dáil being reduced from 57 to 46. The smaller parties gained many seats, Labour returning 22 members and the Farmers, National League, and Independents 33 between them. So too did Fianna Fáil, though its representatives still declined to take seats. Cosgrave, however, despite this decline in his party's strength, was alone in a position to form a new administration.

#### Measures Against Extremists

A month after the election Kevin O'Higgins, vice-president of the executive council, was assassinated outside Dublin. The government, taking the view that the assassination constituted an attack upon the stability and a challenge to the authority of the state and holding the more extreme republicans responsible for encouraging acts of violence, responded by introducing into the dáil a public safety act which gave wide powers to the executive. This was followed by the announcement of legislation prescribing that all candidates at future elections must take an oath stating their willingness to enter the dáil by subscribing to the oath of allegiance. This threat compelled De Valera and his followers to take a drastic decision, and rather than face permanent exclusion they decided to subscribe to the oath, though they maintained that in the circumstances it was no more than "an empty formula." On August 16, on a motion of "no confidence," the government was saved only by the disappearance of a National League deputy at the last moment, which allowed the speaker to give his casting vote on the ministerial side. A general election followed, and when the sixth dáil assembled on Oct. 11, 1927, Cosgrave, who formed a new administration, had 61 followers to De Valera's 57. The smaller parties were greatly reduced in strength, Labour returning 13 members, and the Farmers, National League, and Independents only 17 between them.

In the ten years that elapsed between the treaty and the fall of the Cosgrave government in 1931, the whole tendency in intra-imperial relations was towards securing in law and in practice the complete autonomy of the British dominions. To this development, the Irish Free State materially contributed. The policy of its government, with its emphasis on the national status of the Irish Free State, was designed to secure

independence within the commonwealth. The advance recorded by the imperial conference in 1926 gave satisfaction, but in the opinion of the Irish government it did not go far enough. Its continued anxiety was to ensure that the principles of equality appropriate to status should also be extended to function. "Our purpose," said McGilligan, the minister for External Affairs in 1926, "is to uproot from the whole system of this state the British government" and in substitution for that "to accept the British monarch." In furtherance of this aim, opportunities were taken to emphasise the independence of the Irish Free State in the field of foreign policy by playing an active part in the councils of the League of Nations, with which the treaty had been registered in 1924, and to appoint diplomatic representatives in foreign capitals.

The Statute of Westminster, with its implicit recognition of the autonomy of the Irish Free State, marked the opening of a new phase in Anglo-Irish relations. Speaking of its effect McGilligan remarked in July, 1931, that "by four years of assiduous concentrated collaboration the whole legal machinery of the old colonial empire had been taken asunder." Certainly the constitutional progress effected during this first decade of the Free State's existence did much to belie the fears of those republican opponents of the treaty who had felt that the idea of constitutional evolution embodied in the conception of dominion status had no reality for Ireland.

#### De Valera's Rise to Power

Internally, the last years of the Cosgrave regime saw a mounting tide of discontent, accentuated by the effects of the world depression and by a recrudescence of violence. The I.R.A. re-emerged and presented a challenge to constituted authority which could not be ignored. The government thereupon had recourse to security measures which were bound to reflect upon its popularity in the country to a degree that it could ill afford. It was, therefore, no surprise when, after ten years in office, the Cosgrave party suffered a decisive reverse at the polls in the election of Feb., 1932. Fianna Fáil, once more notably increasing its strength, secured 72 seats, and De Valera's election to office duly followed. O'Kelly became vice-president of the executive council, Frank Aiken

minister for Defence, Seán Lemass minister for Industry and Commerce, and Dr. James Ryan minister for Agriculture.

De Valera's first action on accession to office was the introduction of a bill to remove the oath from the constitution. In a communication dated March 22, 1932, to J. H. Thomas, then secretary of state for Dominion Affairs, he stated that the oath was "an intolerable burden," "a relic of medievalism" imposed from outside "under the threat of immediate and terrible war." In this protest there is no doubt he had strong support in the country, even outside his own party. It was arguable, moreover, that the recent constitutional advances which had received legal endorsement in the Statute of Westminster conferred upon the Free State constitutional powers not contemplated by the signatories of the treaty, and had modified the status therein defined to the extent of according full autonomy to the self-governing dominions. The issue was not considered carefully in this light, because De Valera made it clear that it was his intention to remove all the recognized symbols of dominion status by the unilateral denunciation of those provisions of the treaty in which they were embodied. In fulfilment of this policy the right of appeal to the privy council was abolished; the occasion of a dispute with the governor general was found in order to deprive the office on his resignation both of authority and dignity; and one by one most of the remaining links with the British Commonwealth were severed.

In 1934 a citizenship bill was introduced in the *dáil* giving clear evidence of the determination to emphasise the distinctive national status of Ireland, though not necessarily to dissociate her finally from the commonwealth. In the debate on the bill De Valera, while admitting that "we are not able to tell the British that they must cease calling our citizens British subjects," stated that when the bill became law "it would be an impertinence if the British were to claim as citizens of their country people who are obviously citizens of another country." And he added "not a single line or comma of this bill would be altered if a republic were declared for the whole of Ireland tomorrow." But De Valera indicated implicitly, if not for political reasons explicitly, his reluctance to sever all

connexion with the commonwealth and reiterated his personal predilection for the solution which in 1921 he had termed "external association" under which a national, independent republic would for certain purposes be associated with a commonwealth, the symbol of whose unity is the crown.

The changes in the constitutional relationship between the two countries were hastened by the abdication crisis in 1936. The opportunity was taken to eliminate the "royal assent" to bills from legislative procedure, to abolish the office of governor general; and to pass an External Relations Act recognizing the association of the Free State with the British commonwealth, and authorising the king, as head of the British commonwealth, to act in the matter of diplomatic and consular representatives, on the advice of the executive council. Internally the consequences of these changes produced a curious situation, since parallel with the external changes the decision had been taken to abolish the senate, still a stronghold of Cosgrave and even of Unionist influence. This meant in effect that the legislature of the Irish Free State, which had consisted of the king and two houses, now consisted of one house. It was clear that the time had come when a new constitutional structure had

of the Fianna Fáil party, "go for ever."

The table printed below shows, for example, that in 1925 no less than 97 p.c. of the Irish Free State's total exports went to Britain. A high proportion of this consisted of livestock exports. That this export was profitable to Irish farmers was not in question, but the Fianna Fáil party maintained that it was unfortunate in its social consequences, since cattle rearing provided little employment, and was politically undesirable, since it tied the country economically to Britain. The positive aim was to provide a more balanced economy by increasing the area of arable land and by fostering on a much greater scale than hitherto decentralised industry.

De Valera widened the basis of the political dispute arising out of his unilateral denunciation of the provisions of the treaty by introducing an economic issue. This was created by the decision not to pay the land annuities. These annuities were half-yearly payments collected from tenant farmers and due to investors through the United Kingdom government for money advanced to enable Irish farmers under a succession of Land Acts to buy out their land. The payment of these sums had been endorsed by two agreements signed by Cosgrave's government

STATISTICAL ABSTRACT SHOWING THE DIRECTION OF EIRE'S EXPORT TRADE OVER A PERIOD OF YEARS

Year	Total	Foreign Countries		British Empire		United Kingdom	
	£1,000	£1,000	Per cent	£1,000	Per cent	£1,000	Per cent
1925	43,374	921	2.1	42,453	97.9	42,302	97.5
1929	46,225	2,749	6.0	43,476	94.0	42,886	92.8
1931	35,546	1,117	3.1	34,429	96.9	34,214	96.3
1935	19,515	1,341	6.9	18,274	93.1	17,991	91.8
1938	24,240	1,545	6.2	22,795	93.8	22,443	92.6

to be devised to replace that enacted in 1922.

Irish Republican sentiment had always regarded economic self-sufficiency as the counterpart of political independence. De Valera on acceding to office in 1932 made clear his intention to readjust Ireland's economy to bring it much nearer to that ideal. That meant on the one hand a departure from the *laissez-faire* economics which had for the most part guided Cosgrave's administration and on the other an attempt to end Ireland's dependence on the British market. The British market "must go" and, to quote an election slogan

in 1923 and 1926 respectively, but neither was submitted to the *dáil* for ratification. *Inter alia* the Fianna Fáil government maintained that these agreements had no validity and that on grounds both of law and equity the payments were unjustifiable. The dispute was a highly technical one, and the prospect of early settlement was slight because the two parties to it could not agree on the composition of a tribunal to which it might be referred.

The refusal to pay the annuities provoked much resentment in London and retaliatory duties were imposed on Irish agricultural

products coming into Britain from which a sum equivalent to the annuities was to be collected. The duties were severe. On Irish cattle, to take one example, the duties varied from £1 5s. to £6 per head according to the age and type of beast imported. Great hardships were imposed on Irish farmers, even though every encouragement was given to them to turn over in part to tillage.

De Valera's government also attempted by means of subsidies and bounties to secure alternative markets overseas, but, as seen from the table in the facing p., these attempts achieved little success. In 1929 Ireland exported 6 p.c. of her products to non-commonwealth countries; by 1936, after four years of the "economic war," this figure had been raised only to 7.2 p.c. The value of the U.K. market to Ireland was notably reaffirmed.

The turnover from pasture to tillage achieved, on the other hand, very considerable success. In 1934 the Irish Free State grew only 10 p.c. of the wheat she consumed. By 1936 this figure had been increased to 33½ p.c., whilst in the war years Eire became virtually self-supporting in wheat. The comparative acreage figures are equally striking. In 1931 the acreage under wheat was 20,848; by 1940 it had reached 305,248; in 1945 with compulsory tillage enforced it had reached 666,300 acres. In the same way the sugar-beet industry was fostered and expanded until Eire became almost wholly self-supporting in sugar. To the sugar factory already established at Carlow were added new factories at Thurles, Tuam, and Mallow under government auspices.

The imposition of duties on Irish agricultural produce by Britain was countered by the imposition of heavier duties on imported manufactured products from Britain. These ranged from 40 p.c. to 75 p.c. They were at once retaliatory and protective. Behind the formidable barrier which they provided native industry was encouraged and every inducement was given to ensure that it was decentralised so as to provide employment not only in the large cities, but also in the smaller country towns. The minister for Industry and Commerce, Seán Lemass, played a notable part in directing this industrial revival. As a result imports were in fact sharply reduced from £61,000,000 in 1929 to £40,000,000 in 1936. The Government moreover embarked on a

programme of expansion in the social services and in a timely and much needed rehousing campaign both in urban areas and in rural districts where housing conditions left much to be desired.

The economic war imposed great hardships on Ireland. De Valera, to secure a new mandate

#### STATISTICAL ABSTRACT SHOWING THE DIRECTION OF EIRE'S IMPORT TRADE OVER A PERIOD OF YEARS

for his policy and popular support for his attitude in the "economic war," went to the polls in 1933 where he increased his strength to 77—a clear majority in the dail. In the 1937 election his position was substantially maintained. The full rigour of the economic reprisals was modified by the Coal-Cattle Pact of February, 1936, which was renewed in February, 1937. From 1932 De Valera's reputation at home grew. His outspoken contributions to debates at the League of Nations were welcomed in wider fields. The principal opposition party, led by Cosgrave, fell into a steady decline. Their association with General O'Duffy's Blueshirts in the early thirties was a damaging legacy and they lacked a positive, popular policy to counter De Valera's nationalist programme.

On June 14, 1937, the new constitution sponsored by De Valera was approved by the dail and submitted to a referendum on July 1 whose verdict was favourable, though not by a very large majority, 686,042 votes being cast in favour; 528,362 against. The constitution came into force on Dec. 29, 1937. It declared Ireland to be a sovereign, independent, democratic state. It reaffirmed the right of the Irish people to choose its own form of government and to determine its relations with other states. The constitution applied to the whole of Ireland but it allowed that "pending the reintegration of national territory" its jurisdiction should have the same area as the Irish Free State. The name of the state is Eire, in the English language Ireland.

The constitution provides for the election of a president (*An Uachtarán*) as head of the state by universal adult suffrage, the president to hold office for seven years. The *Oireachtas* or parliament consists of the president and two houses. The restored senate consists of 60 members, eleven nominated by the prime minister (*An Taoiseach*), six by the universities, and the re-

taran) as head of the state by universal adult suffrage, the president to hold office for seven years. The *Oireachtas* or parliament consists of the president and two houses. The restored senate consists of 60 members, eleven nominated by the prime minister (*An Taoiseach*), six by the universities, and the re-

maining 43 on a vocational basis. The position and powers of the dail remained substantially unaffected. The prime minister and his cabinet are responsible to it.

The constitution also lays down certain principles of social policy for the guidance of the legislature and certain fundamental rights to be enjoyed by every citizen. It recognizes the family as the "natural, primary and fundamental" unit in society, and it pledges itself to guard with special care the institution of marriage. The special position of the R.C. church as the guardian of the faith professed by the great majority of the people is recognized.

The 1937 constitution did not define the state as monarchy or republic. The crown was not mentioned, though provision was made obliquely for the use of the royal signature to letters of credence to foreign powers. In a statement issued after the promulgation of the new constitution, the government of the United Kingdom declared with the assent of the overseas dominions that it would continue to regard Eire as a member of the commonwealth and that H.M. government would regard the new constitution "as not effecting a fundamental alteration in the position of the Irish Free State."

The first president, Dr. Douglas Hyde, held office from 1938 to 1945, when Seán T. O'Ceallaigh (Seán T. O'Kelly) was elected to succeed him.

The economic war was ended in 1938 by a compromise solution under which Eire paid a lump capital sum of £10,000,000 as a final settlement of all outstanding claims by either government up to

the time of the agreement. The U.K. government as part of a wider policy of settling all outstanding differences with Eire agreed to hand back the ports, Cobh, Berehaven, and Lough Swilly, held under the treaty of 1921. In little more than a year war engulfed Europe.

When Germany invaded Poland, Eire, as had been expected, announced her intention of remaining neutral in the conflict. This decision was endorsed by the vast majority of the Irish people. De Valera consistently declared that one governing reason for Eire's neutrality was the need to preserve internal unity. Any other course might have led to civil war, all the more so in view of the revived terrorist activities of the I.R.A. in 1938-9. The policy of neutrality was reinforced by the imposition of a rigid censorship designed to eliminate any possibility of public appeals to sentiment or to reason to engage in the conflict on either side.

#### Eire's Policy of Neutrality

In 1941 a few scattered bombs were dropped by German aircraft in Dublin and the provinces, and in the latter year heavy raids on Belfast aroused practical sympathy south of the border. Every effort was made, despite lack of equipment and aircraft, to have the country's defences manned so as to be in a position to withstand aggression. The regular army was reinforced by the creation of a volunteer local security force to which all classes and all sections of opinion rallied. This was an indication of the fact that for the first time since the treaty the principal Irish parties were in complete agreement about the policy which the country should pursue. It is very significant that in neither of the two wartime general elections, held in 1943 and 1944 respectively, was neutrality an issue. The people's confidence in De Valera was renewed because it was generally believed that his experience and his diplomatic skill would serve the country best in the carrying out of its chosen policy during these critical years.

While neutrality remained in effect unchallenged as a policy—except by J. M. Dillon—many thousands of Eire's citizens joined the British forces and served in them with gallantry. Thousands more went to work in Britain's war factories. This great wartime exodus of young men and women undoubtedly had a healthy influence in improving Anglo-Irish rela-

tions, despite the wartime strains to which they were subjected.

The isolation from the western world which neutrality involved heightened Eire's sense of economic and political self-dependence. On the economic side, particularly after the Japanese entry into the war, imports of many raw materials and foodstuffs were virtually cut off. The resulting difficulties were enhanced by the acute fuel shortage. Trains were compelled to run on wood and turf at the most stringent period, and for over four years there was only sufficient petrol to maintain essential services. On the other hand, thanks in no small degree to the steps that had been taken to bring about a better balanced agricultural system, Eire remained throughout a country of comparative plenty, though there was a lack of imported foods; the tea ration, for instance, was for several years  $\frac{1}{2}$  oz. per week. On the political side, neutrality, adopted as a policy, came to be regarded as a symbolic assertion of national sovereignty.

When the U.S.A. entered the war, De Valera described Eire's position as that of "a friendly neutral," but he added, "from the moment war began there was for us only one policy possible—neutrality. Our circumstances, our history, the incompleteness of our freedom, from the partition of our country, made any other policy impracticable. Any other policy would have divided our people, and for a divided nation to fling itself into war would have been suicide." When American troops landed in Northern Ireland in 1942, De Valera protested on the ground that the partition was "aggression which his government would denounce, no matter what troops occupied the six counties."

#### Axis Diplomats in Dublin

Throughout the war, the diplomatic representatives of the Axis powers remained in Dublin. Misgivings were entertained in many quarters about the facilities for espionage enjoyed in a neutral capital so well situated for this purpose. In February, 1944, the American government presented a note asking for the removal of these diplomats on the grounds that in general "the neutrality of the Irish government operated and in fact continued to operate in favour of the Axis powers," and in particular that the Axis legations were either engaged or were able to engage in large-scale espionage for their respective governments.

The reply to this note denied the general charge and rejected the particular request. "It is not perhaps known to the American government," ran a sentence in De Valera's reply, "that the feelings of the Irish people towards Britain have undergone a considerable change precisely because Britain has not attempted to violate our neutrality." Partition, in fact, remained the one outstanding question between the two countries.

#### Favourable Post-War Position

The immediate post-war years found Eire in a strong creditor position. Her accumulated sterling balances amounted in 1946 to some £400 million. In comparison with the war-torn countries of the European continent, Eire's position was indeed fortunate. For later events in the history of the country, including the electoral defeat of De Valera and the passing of the Republic of Ireland Act, 1948, see in N.V. pages at the end of this Encyclopedia.

#### LANGUAGE AND LITERATURE.

The Irish language is taught in all schools and a knowledge of it is essential in the civil service and in most public offices. The great majority of the people, however, remain English speaking.

Literature in English continued to flourish, but the high tide of the great literary movement of the early twentieth century had passed. The romantic nationalism of the earlier writers was replaced by a realism that sometimes bore the impress of disillusion. Of this new sentiment, Seán O'Casey was perhaps the outstanding interpreter in the field of drama, and his plays of Dublin life, of which *The Shadow of the Gunman* is perhaps most familiar, long moved audiences at the Abbey Theatre to laughter and to tears. Lennox Robinson, T. C. Murray, and Denis Johnston all made notable contributions to drama, Johnston's *The Moon in the Yellow River* making a deep impression.

Realism also profoundly influenced the novel in Eire, Liam O'Flaherty's *The Informer* being an outstanding contribution by this new school. Daniel Corkery and Frank O'Connor made reputations as writers of short stories, the latter's *Bones of Contention* containing masterly sketches of Irish life and character. Seán O'Faolain achieved note both as a novelist and as a writer of historical biography. Elizabeth Bowen, an Anglo-Irish novelist, showed her pre-eminence as a short-

story writer in, e.g., *The Demon Lover*. Lord Dunsany's work both as dramatist and story-teller stands outside the main stream of Irish literature. Yeats and Moore, Joyce and Shaw, were all Irishmen, but their writings belong not to Irish but to world literature.

**Bibliography.** Statistical Abstract, annually; Irish Parliamentary Handbook, 1939; Official Reports of Dáil and Senate Debates; *The Irish Free State, 1922-27*, D. Gwynn, 1928; *The Constitution of the Irish Free State*, L. Kohn, 1932; *The Irish Free State: Its Government and Politics*, N. Mansergh, 1934; *The Irish Struggle and its Results*, L. P. Dubois, 1934; *Peace by Ordeal*, Frank Pakenham, 1936; *The Irish Republic*, Dorothy MacCardle, 1937; *Ireland and the British Empire*, H. Harrison, 1937; *Irish Journey*, S. O'Faolain, 1940; *Britain and Ireland*, N. Mansergh, 1942.

**Eisenach.** German town in the state of Thuringia, until 1918 second residence of the grand-dukes of Saxe-Weimar-Eisenach. It stands in the valley of the Hörsel, 32 m. by rly. W. of Erfurt, and was internationally known mainly by the neighbouring Wartburg (q.v.) with its legends and history. Of its seven monasteries in the Middle Ages, one is partly preserved, together with the Romanesque church of S. Nicholas (12th century) and the church of S. Anne (13th cent.). The market church, former palace (1742-45), and town hall (1508, rebuilt 1638) are other remarkable buildings which survived the Second Great War. J. S. Bach was born and Luther went to school in Eisenach, which was renowned for its schools, theatre, museums, and spa for rheumatic diseases. Founded in the 12th century by the Thuringian landgraves, it was a capital of a separate duchy from 1672 to 1741, then united with Weimar until 1918. It fell to American infantry in the Second Great War, April 6, 1945. Pop., pre-war, 44,695.

**Eisenberg.** Town of Germany, in Saxe-Altenburg. It is 24 m. W. of Altenburg, and is connected by rly. with Leipzig. Old buildings include a castle, churches, schools, etc., and there are porcelain and piano factories. Pop. 11,900.

**Eisenhower, Mount.** Peak of the Canadian Rockies. Formerly called Castle Mt., it was renamed in 1946 in honour of Gen. D. D. Eisenhower, supreme commander of the Allied expeditionary forces in N.W. Europe. The mountain is near Banff, in the S.W. of Alberta. Alt. 9,390 ft.

## EISENHOWER: SUPREME COMMANDER

Lieut.-Gen. Sir Gifford Le Quesne Martel, K.C.B., D.S.O.

*Eisenhower's ability to secure the loyalty and cooperation of the men of varied nationality and personality who served under him during the Second Great War was a vital factor in the success of his campaigns, described under the headings Europe, Liberation of; North Africa Campaigns*

Dwight David Eisenhower was born on Oct. 14, 1890, at Denison, Texas, U.S.A., the 3rd son of David J. Eisenhower and Ida Elizabeth Stover. His family moved shortly afterwards to Abilene, Kansas, where he received his early education. In 1912 he went to the U.S. military academy at West Point, graduating 1915. He did not take a leading position in his academic studies at school or at the academy, though he passed his tests satisfactorily; at both he excelled in sport and games.

During 1915-1917 he served in the infantry as a company officer, and as an instructor in army service schools at Fort Leavenworth. In 1918 he organized and commanded Camp Colt, a training centre for tank corps troops. He remained with the tank corps until 1922; then became executive officer of Camp Gaillard, Panama, and subsequently served in various posts in many parts of the U.S. In 1926 he graduated at the command and general staff school, Fort Leavenworth, Kansas, being placed first in the list. Next year, with the rank of major, he was appointed to the American battle monuments commission in Paris.

During 1929-33 he was assistant executive in the office of the assistant secretary of war, graduating meanwhile from the army industrial college, and drafting the war department's plans for indus-

trial mobilisation in case of war. Until 1935 he served in the office of the chief of staff; then until 1940 he became assistant military adviser (under Gen. MacArthur, q.v.) to the commonwealth of the Philippines. On returning to the U.S.A. Eisenhower served, in quick succession, as chief of staff to the 3rd division, the 9th corps, and the 3rd army, taking in the last named post a prominent part in the 1941 manoeuvres in Louisiana—largest peace-time military exercise ever held in the U.S.A. By now a brig.-gen., he went to Washington as assistant chief of staff in charge of the operations division, war department general staff, under Gen. Marshall (q.v.), until in June, 1942, now a maj.-gen., he was ordered to England, as commander of U.S. forces in the European theatre of operations (a new post), with instructions to begin preparations for U.S. participation in a cross-Channel attack against "Fortress Europe." His promotion to lieut.-gen. followed.

Shortly after his arrival in England, he was ordered to take command of the Allied attack on Vichy-controlled French N. Africa. The Vichy and U.S. governments were still in diplomatic relations; and since information furnished by the American chargé d'affaires in Algiers, Robert Murphy, led the Allied leaders to believe that whereas a British landing force might encounter opposition the Americans would be welcomed, it was decided that the initial landings should be made by U.S. forces only, a British force landing later, with General Eisenhower as c.-in-c. of the whole.

Eisenhower made his own attitude towards his command clear by stating: "This is an Allied campaign . . . There will be neither praise nor blame for the British as British or the Americans as Americans. We are in this together as allies. We will fight it shoulder to shoulder."

The date set for the invasion was Nov. 8, 1942. The day before, Eisenhower broadcast two messages, also distributed by air, to Frenchmen in N. Africa, emphasising that his forces came as friends to make war against France's enemies, and that the

*Dwight D. Eisenhower*

sovereignty of France over French territory remained unaffected. Giraud (*q.v.*), describing himself as c.-in.-c. of French forces in N. Africa, broadcast an appeal for support from his fellow countrymen; while De Gaulle (*q.v.*) broadcast from London, urging the French in N. Africa to rise and help France's allies. Satisfactory landings—the largest operation of the kind ever attempted to that date—were effected in Algeria, though not without serious opposition, brought to an end on Nov. 11 when Admiral Darlan (*q.v.*), c.-in.-c. French (Vichy) Forces, who happened to be in N. Africa, decided to throw in his lot with the Allies and ordered the French to cease fire.

#### Appointed C.-in.-C. North Africa

While the Allied troops under their field commanders advanced against increasing German opposition into Tunisia, Eisenhower found himself involved in a net of French political intrigue in Algiers, somewhat simplified by the assassination of Darlan, whom no one trusted, on Dec. 24, 1942. President Roosevelt and Winston Churchill, meeting in Casablanca in Jan., 1943, eased the political situation by bringing De Gaulle and Giraud into personal contact there; and in consultation with the combined chiefs of staff settled the order of military precedence to include the 8th army, then advancing towards Tunisia. This decision, made public on Feb. 6, created a N. Africa operational theatre under the command of Eisenhower, with Gen. Alexander as his deputy. Eisenhower's promotion to gen. followed in a few days. Churchill, who spent Feb. 5 and 6 with him at Algiers, told the house of commons on Feb. 11, "I regard him as one of the finest men I have ever met."

The course of the fighting in Tunisia is described under North Africa Campaigns. It finished in May, and preparations were immediately begun for a landing in Sicily (*q.v.*), conquest of which was carried through triumphantly under Eisenhower's command between July 10 and Aug. 17, 1943. The swiftness of this operation led to the downfall of Mussolini, and the surrender of Italy on Sept. 3, the day of the first Allied landings (again under Eisenhower's command) on the mainland of Europe near Reggio in Catania.

In Dec. Eisenhower was notified by the combined chiefs of staff that he had been appointed supreme commander of the British

and U.S. expeditionary forces organizing in the U.K. for the liberation of Europe. In a press interview at his G.H.Q., in N. Africa, he declared that his immediate job would be "to weld the directing team together in such a way that no real friction ever develops, that people trust each other, work in unison, and go into this thing with their full weight."

Eisenhower had proved not only his own ability to work with men of other nationalities and of varying temperaments, but also a rare capacity for getting them to work together, and he was to continue to demonstrate these gifts essential to the successful outcome of the Allied purpose.

The outline plan of Overlord, as the operation which he was now engaged was called, had been approved at the Quebec conference in Aug., but when Eisenhower studied it early in Dec. he felt the initial assaulting forces proposed were of insufficient strength, and the front too narrow.

On his arrival in London on Jan. 15, 1944, he initiated discussions which led to an increase in the striking force from three to five divisions, and the extension of the beach-head area. His official appointment as Supreme Commander Allied Expeditionary Force dated from Feb. 14. His headquarters (known as SHAEF), located at first at Norfolk House, St. James's Sq., London, was moved at his desire, with the object of closer unification, to Bushey Park, near Kingston-on-Thames, in March.

#### His Irrevocable Decision

The date originally set for the invasion was May 1; but the insufficiency of assault craft for the larger striking force Eisenhower was using made postponement necessary, and the first week of June was chosen instead, Eisenhower setting June 5 as the first date, subject to last minute revision if the weather were unfavourable. The 6th and 7th were equally acceptable, but then the next date on which conditions of time and tide were suitable was June 19. June, 1944, brought the roughest weather experienced in the Channel in June for 20 years. The weather forecast on the morning of June 5 "contained a gleam of hope," says Eisenhower, for the following day. "At 04.00 hours on June 5 I took the final and irrevocable decision: the invasion of France would take place on the following day." The great-

est decision in military history had been made, and the victorious campaign (described under the heading Europe, Liberation of) was initiated.

After the departure of the German delegates from the surrender ceremony at Reims on May 7, 1945, Eisenhower said to the Allied commanders who had witnessed it: "This unconditional surrender has been achieved by team work. To every subordinate in this command of five million men who took part I owe a debt of gratitude which I can never repay." In the conclusion of his report on the operations in N.W. Europe he wrote, "The United States of America and Great Britain have worked, not merely as allies, but as one nation, pooling their resources of men and material alike . . . An allied experiment unprecedented in the history of the world has been carried out with decisive results." The overwhelming success of this gigantic experiment was the measure of Eisenhower's greatness of character and his wisdom.

#### Awards and Honours

Eisenhower was among the first three soldiers to be made general of the U.S. army when that five star rank was created Dec., 1944. He was chosen in March, 1945, to be c.-in.-c. of the American forces of occupation in Germany, and chief U.S. representative in the Allied military government of Germany, posts he assumed after the surrender of the German forces in May, making his H.Q. at Frankfurt-on-Main. On June 11 he flew to England. Next day he drove through cheering crowds to the Guildhall to receive the freedom of the city of London, and the sword worn by Wellington at Waterloo, pending completion of a special sword of honour. The same day King George VI conferred on him, its first American recipient, the O.M. (he had been made hon. G.C.B. in 1943). On June 18 he was in Washington, where he addressed a joint session of Congress, describing the work of a commander as "a soul-killing task," and expressing his deep sense that war must not happen again. President Truman conferred on him the D.S.M. On an official visit to New York next day, to receive its freedom, he was given the biggest reception in the city's history, the crowd along his 37-mile drive being estimated at four million. The Order of Victory, highest Russian decoration, was conferred on him in June, and

when he visited Moscow in Aug. he was fêted by Stalin. Then he went to Belfast and Edinburgh receiving the freedom of both and, from the Scottish people, the life gift of a flat in Culzean Castle, Ayrshire.

On Nov. 20 Eisenhower who favoured a unified command for the U.S. armed forces, was appointed chief of staff of the U.S. army in succession to Gen. Marshall. In 1947 he accepted the presidency of Columbia University, New York taking up his duties in 1948. He refused suggestions from both the leading political parties that he might stand as presidential candidate in the 1948 elections. In 1949 he returned for a short time to the army as principal military adviser to the president and chairman of the joint meetings of the chiefs of staff. Eisenhower published *Crusade in Europe* 1948.

*Consult* Report by the Supreme Commander to the Combined Chiefs of Staff on the operations in Europe of the Allied Expeditionary Force, 1946, *Three Years with Eisenhower*, H. C. Butcher, 1946; *Gen. Eisenhower*, A. Hatch, 1946.

**Eisenstadt.** Town of Austria, in the prov. of Burgenland. It is 25 m. S.E. of Vienna, at the base of the Leitha Mts. It is famous for its magnificent palace long the residence of the Esterhazy family. Built in 1683, and enlarged in 1805, this has a fine library and beautiful gardens. The town has also a Franciscan monastery with a church in which members of the family of Esterhazy are buried. Haydn, conductor of the palace orchestra from 1760 to 1790 is also buried there.

**Eisenstein, SERGEI (1898-1948).** Russian stage and film producer. Born in Riga he became a scenic artist in 1920. His interest in psychology was evidenced in his methods of dramatic production; and when in 1924 he directed *The Strike* the first film in which masses of people took the place of single characters, he was recognized as a force in film technique. His later films, largely propagandist, included *The Battleship Potemkin*, *Ten Days that Shook the World*, *The General Line*, *Thunder Over Mexico*; and the historical dramas, *Alexander Nevsky* and *Ivan the Terrible*. Producer for the first Russian workers' theatre, he was awarded the Order of Lenin 1939, and the Stalin prize, 1941. He wrote *The Film Sense* 1943, and articles on films and film technique in periodicals. He died at Moscow Feb 10 1948.

**Eisleben.** Town of Germany, in Saxony. It is 20 miles W.N.W. of Halle, and is famous for its association with Luther, who was born and died here. The chief churches are those of S. Andrew and SS. Peter and Paul, both 15th century. There are separate town halls for the upper and lower towns. The memorials of Luther include the house in which he died, now a museum, a school which he founded, and a bronze statue. Eisleben has a school of mining, and is the trading centre for silver and copper mines. It was long on the lands of the counts of Mansfeld. In 1710 it passed to Saxony, and in 1815 became part of Prussia. It was in the Russian occupied zone of Germany after the Second Great War. Pop. approx. 25,000.

**Eisner, KURT (1867-1919).** The name adopted by Salomon Kosnowsky, German Socialist writer and politician. He was born in Berlin, May 14, 1867, of Galician-Jewish origin. Joining the Socialists he became associate editor of their organ, *Vorwärts*. When the First Great War broke out he joined his party in supporting it, but before the end he was one of the South German leaders who opposed the Kaiser. On the outbreak of the revolution of Nov., 1918, he himself took the position of prime minister and minister of foreign affairs, and later that of first president of the Bavarian republic. He sought to separate Bavaria from the rest of Germany, and to make separate peace arrangements with the Allies, but unavailing, and was assassinated in Munich, Feb. 21, 1919.

**Eistaler Spitze.** A peak in Czecho-Slovakia, 8,630 ft. It is one of the most difficult climbs in the High Tatra, but the views from the summit over the wide plain of Galicia to the N., and the Hungarian lowlands to the S., well repay the climber.

**Eisteddfod** (Welsh, session). Welsh national bardic festival: a public meeting at which contests are held in music, making or reciting poetry, writing prose, and arts and crafts of all kinds. Hardly a district in Wales does not hold a local Eisteddfod at least once a year; and the National Eisteddfod is held in N. and S. Wales alternately during the first week in Aug. The date of origin is not known, but certainly the holding of contests is an ancient custom among the Welsh. A festival held by Lord Rhys in Cardigan Castle in 1176 was "proclaimed" a year in advance in Wales, Ireland, Scotland, and England. There were two main contests, one for poets and one for musicians, and the winner in each contest was given a chair.

The next Eisteddfodau of which there are records were at Carmarthen (1450), and Caerwys (1523 and 1568). Probably many minor festivals were held in Wales during the 17th and 18th centuries, but they bore little resemblance to the modern Eisteddfod. In 1789 there were great assemblies at Llangollep and Corwen. Soon afterwards societies sprang up throughout Wales to foster literature and music and the Welsh language. In 1819 at Carmarthen the Gorsedd, with its colourful bardic rites, came for the first time

Eisteddfod. Ceremony of the Gorsedd, as held in 1939 at Bridgend, Glamorganshire; the sword of peace is being raised aloft

into the framework of the Eisteddfod. Contrary to popular belief, the bardic ceremony is not a legacy from the pre-Christian era, but an invention of Edward Williams (Iolo Morgannwg) in 1792. He meant the Gorsedd to take the place of the Eisteddfod, which however gained ground so quickly that he decided to make the former part of the latter. At Carmarthen, taking some pebbles out of his pocket and laying them in a circle on the ground, he started the tradition by which the great circle of stones is seen when the Gorsedd is held in the open air.

At the Denbigh Eisteddfod of 1860, a council was set up to organize a single annual festival for the nation. The council was replaced in 1880 by the National Eisteddfod Association, which became the National Eisteddfod Council in 1937. One of its functions is the publication of prize-winning works and adjudications. During the Second Great War the Eisteddfod was held in a curtailed form.

**Ejectment** (Lat. *ejectare*, to cast out). Name of an old English action to recover possession of land. Originally it could be brought only by a leaseholder and not by a freeholder; but by the fiction of John Doe (*q.v.*) judges allowed it to be made use of by freeholders, who preferred it to the cumbersome remedies of a writ of right, or a writ of Novel Disseisin. By the Common Land Procedure Act, 1852, John Doe was abolished, and now an action for the possession of land may be brought by anyone entitled to such possession. See Land Laws.

**Ejector**. Appliance for operating a vacuum brake by exhausting or ejecting air from the brake cylinders. It consists of a pipe within an outer casing with an annular space between the two. When steam is admitted to the pipe, in the act of escaping at the outer end it draws the air from the annular space which is connected by piping to the brake cylinders. Valves are provided for controlling the amount of steam and air admitted. The ejector is fitted in the driver's cab, and is controlled by the engine driver, but valves are provided in guards' vans so that a guard can apply the brakes independently. The same principle is used in many ways for moving liquids.

An ejector pump is one used principally for the drainage of flat districts and works by means of compressed air supplied from a

central station. The pressure of the air forces the drainage through a system of valves, until it reaches its discharging point. See Brake; Injector; Pump; Steam Engine.

**Eka** (Skt., *one*). Word used by Mendeléeff as a prefix for a hypothetical element which filled a blank in his arrangements of chemical elements according to the periodic table. By extension, *eka-iodoform* was the name given to a sterile iodoform produced by mixing with iodoform a small proportion of paraform.

**Ekaterrinburg**. Former name of the Russian town of Sverdlovsk, by which it was known when Tsar Nicholas II and his family were assassinated there on July 16, 1918. See Sverdlovsk.

**Ekhmin**, or **AKHMEN**. Town of Egypt. It stands on the Nile 70 m. above Assiut. For more than 2,000 years it has been the chief centre for the manufacture of the cotton shawls used by the natives. Here are the remains of the temple of Pan (the Egyptian Amsu or Min) and other ruins, and an extensive Egyptian and Roman cemetery. In early Christian times Ekhmin was an important Christian centre. In the neighbourhood, near the village of Hawawish, have been found valuable papyri, including the "Gospel of Saint Peter." Pop. 28,000.

**Ekkron**. Ancient town of the Philistines. It is the modern Akir, a small village in Palestine, situated 23 m. W. of Jerusalem. A Jewish colony was established here by Lord Rothschild in 1884.

**El**. Variant of *al*, the definite article in Arabic. In this encyclopedia the word is treated like its English equivalent, the, and not considered part of a heading; thus, *El Agheila* will be found under *Agheila*, *El*. The popular term *El Alamein* was wrong, as it included a duplicated prefix. See *Al*.

**Elaeagnaceae** (Gr. *elaia*, olive; *hagnos*, pure). Small family of shrubs and trees, natives of the N. temperate and tropical zones. They are more or less covered with silvery or brown scales. They have entire leaves, and small white or yellow flowers. The fruit is membranous, and enclosed in the tube of the calyx. The two best known species are the oleaster (*Elaeagnus*) and sea buckthorn (*Hippophae*).

**Elaeocarpus** (Gr. *elaia*, olive; *karpós*, fruit). Genus of evergreen shrubs and trees of the family *Elaeocarpaceae*. Natives of the East Indies and Australia, they have alternate, lance-shaped or

oblong leaves, and small, white, fragrant flowers in sprays. The cherry-like fruit has a rough-shelled seed.

**Elaeococca** (Gr. *elaia*, olive; *kokkos*, seed). Genus of plants of the family *Euphorbiaceae*. They are natives of China and Japan. The seeds by pressure yield valuable oil, and those from *E. verrucosa*, a Japanese plant, are used for burning in lamps. From a Chinese species, *E. vernicia*, is obtained an oil useful for mixing paints.

**Elaelite** (Gr. *elaia*, olive; *lithos*, stone). A variety of the mineral nepheline, theoretically a silicate of sodium and aluminium ( $\text{NaAlSi}_3\text{O}_8$ ) but always containing excess silica and a little potash. Current usage tends to drop the name in favour of nepheline. Elaelite generally occurs in massive form, rarely in coarse crystals: it is usually cloudy with minute inclusions and has a greasy lustre. It is characteristic of certain granular alkaline plutonic rocks. See Nepheline.

**Elagabalus** or **HELIOGABALUS**. Roman emperor A.D. 218-222.

The son of Sextus Varius Marcellus and Julia Soaemias he was originally called Varius Avitus Bassianus. He was born and brought up at Emesa in Syria, where at the age of 13 he was made priest of

Elagabalus.  
Roman emperor  
Buried in the  
Capitol, Rome

Elagabalus, the Syrian sun-god, and assumed his name. By pretending that he was the natural son of Caracalla, his grandmother, Julia Maesa, persuaded the legions in Syria to proclaim him emperor, under the name of Marcus Aurelius Antoninus.

Abandoning the reins of government to his mother and grandmother, he devoted the first year of his reign at Rome to the introduction of the worship of the sun-god, represented by a large conical black stone which he had brought with him from the East. A sexual pervert, his short reign was a continuous orgy of vice. An attempt to murder his cousin Alexander, whom the senate had induced him to adopt as his successor, was frustrated by the praetorian guards, who took Alexander under their protection and afterwards murdered Elagabalus, March 11. 222.

**Elaine.** (1) Character in La Morte d'Arthur. She was the daughter of King Pelles and married Sir Lancelot. Their son was the blameless knight Sir Galahad, who achieved the Holy Grail. (2) Daughter of Sir Bernard of Astolat and known as the Maid of Astolat. Her story appears in Tennyson's *Idylls of the King* (*q.v.*).

**Elam.** Biblical name for a low land and mountain region in S.W. Persia, N. of the Persian Gulf. Partly known also as Elymais, it comprised the lowlands E. of the Tigris, with the highlands lying N and E. Wars were frequent between the Assyrians and the Elamites, and Ashurbanipal conquered the latter in 644 B.C. Susa the Biblical Shushan. In Persia became the capital of the country, which was watered by the Kerkha (Choaspes). Its neolithic population, perhaps anterior to but allied with the Sumerian, developed their agglutinative speech, picture-writing and industrial art under local impulses. At one time dominating Babylonia, it afterwards became subject, allied or independent, and experienced both Semitic and Iranian infiltration. Its vigorous native art excelled especially in metal-casting and jewelry. See Babylonia; Mesopotamia; Susa.

**Elamites.** People of ancient Elam. The ethnic relationships of the Elamites await further research. Although the early human remains are scanty, a shortish, long-headed, black-haired, glabrous stock, allied to the Mediterranean brown race, apparently occupied this region. Semitic intermixture gave them a ruling class, afterwards affected by Aryan elements, resulting in the racial strains discernible in the early Persian domination. The Elamites of Acts ii descended from Jewish settlers in Shushan after the exile, having no ethnic affinity with the native people, whose characters are now submerged under the Beni Lam Arabs of the modern Persian province of Arabistan.

**Elan.** River of mid-Wales. It rises on the E. boundary of Cardiganshire, and flows S.E. through the W. portion of Radnorshire to Brecknockshire, where it turns N.E. to form the boundary of these counties and enters the Wye after a course of 15 m. The watersheds of the Elan and Claerwen, its tributary, have been acquired by Bir-

Elaine, the beautiful daughter of King Pelles, in the Arthurian tales, as depicted by Mouat London

By permission of the artist

mingham, and three reservoirs have been constructed on the Elan, whence the water is carried to the city by an aqueduct 74 m. long.

**Eland.** Genus of large antelopes, found only in Africa. They are the largest of all the antelopes, a fine bull standing nearly 6 ft. high at the withers. In colour, they vary from light fawn to grey, and the bulls usually have a thick tuft of dark hair on the forehead. Both sexes bear horns, about 2 ft. in length, and more or less twisted. They are found in most parts of E. Africa, but appear to be extinct in the South. They frequent wooded districts, and go in herds of fifty or more. Attempts have been made to acclimatise them in Great Britain, where they do well in parks, but they mature so slowly that they cost more in food than they are worth.

**Elandslaagte.** Village in Natal, known for an engagement in the early part of the S. African War. It is on the hills, 16 m. N.E. of Ladysmith, 3,614 ft. above sea

level. On Oct. 21, 1899, General French, with a small force moved out of Ladysmith to attack the Boer positions in the hills. He had with him only a few hundred men, but as the artillery duel was opening he realized that he was outnumbered and telephoned back for reinforcements. British battalions, Gordon Highlanders and Devons, were soon on the scene, also some Lancers and other cavalry, and the attack was pressed, the British advancing in open order up the hills. The Boer artillery was weaker than the British, and with a few casualties their position was taken. Some Boers resisted, but the majority rode away, while about 200 were made prisoners. The British lost 41 killed and 220 wounded; the Boers about 250.

**Elasmobranchs** (Gr. *elasmos*, metal plate; *branchia*, gills). A group of fishes, which includes sharks and rays. They are characterised by the possession of cartilaginous or gristly skeletons, though sometimes the cartilage is partly calcified. The scales are distant, and are homologous with the teeth in all vertebrates. The external gill openings are not protected by plates: the mouth is usually placed on the under side; there is no swim-bladder: and the two tail fins are of unequal length. Only the sharks and rays still exist. Marine in habit, they occasionally ascend rivers.

**Elastic.** Term more particularly used for a special fabric containing strands of rubber, usually made in the form of tapes, cords, and bands. The word is derived from an assumed Gr. form, *elastikos*, from *elavnein*, to drive, set in motion. See Elasticity; Rubber.

**Elasticity.** Property of matter in virtue of which it resists change in shape or bulk, and tends, after distortion, to recover its original shape or bulk when allowed to do so. Fluids have no fixed shape, and therefore no power to resist change of shape; they have no "elasticity of form"; but they resist compression and have "elasticity of bulk." Solids possess both kinds of elasticity.

An external force producing distortion in a body is known as a "stress" (strictly the force per unit area) and the distortion itself is called a "strain." The mathematical theory of elasticity deals with the various kinds of strain which a body may suffer, and the stresses corresponding thereto. If the strains are small, the general principle of the relation between stress and strain is "Hooke's

Eland. Specimen of the large gregarious antelopes found in most parts of East Africa

Law"—the stress is proportional to the strain it produces. It is generally assumed that the strain is small, as the elasticity of a solid has a definite limit (the "elastic limit"), and when the strain exceeds this limit it produces a permanent deformation, or actual fracture if the "yield-point" is reached. When a body is strained beyond the elastic limit by rapidly varying forces, it may be broken by a load less than the normal maximum.

#### Hooke's Law of Stress and Strain

A simple example of Hooke's Law is afforded by a steel wire stretched under the tension of a weight suspended from it. Hence the weight per unit area of cross-section is the stress, the longitudinal extension per unit length of the wire the strain, and it is found that for comparatively small strains the extension is proportional to the weight. Moreover, if wires of the same material, but of different lengths and thicknesses, are compared, the ratio of stress to strain is still constant, if each is measured on a suitable scale. For any given material, such as steel, the ratio of stress to strain is constant, and this constant number is called "Young's modulus" for the material. For steel wire it is about 13,000 tons to the square inch, and from this it is easy to calculate the longitudinal extension of a steel wire of any given length and cross-section, when stretched by a known weight.

In this case the wire suffers a change in volume as well as in form; the longitudinal expansion is accompanied by a slight lateral contraction, but the volume of the wire is on the whole increased. A strain in which there is pure change of form with no change of volume is known as a "simple shear"; it can be illustrated by twisting a wire. Here, again, for small twists the ratio of the "shearing stress" to the "shearing strain" is constant, this constant being known as the "rigidity." When a solid or a liquid is compressed, the ratio of the compressing force per unit of surface area (stress) to the proportionate diminution in volume (strain) gives another constant, the "volume elasticity," or "bulk modulus."

The theory of elasticity is of great importance to the engineer who has to deal in every kind of structure and machine with materials in various states of strain. See Materials, Strength of.

**Elastic Limit** or **LIMIT OF PROPORTIONALITY**. When a metal

Elba. Fortress of Porto Ferrajo, the capital. Above the harbour is the palace of Napoleon I

or alloy is subjected to any stress, perhaps in tension, compression, or torsion, it becomes deformed. Up to a certain point, termed the elastic limit, the deformation is elastic; i.e. the metal will return to its original shape when the stress is removed. Once the stress exceeds this limit the metal becomes permanently distorted. The measurement of this property is important to engineers and is usually determined during a tensile test (*q.v.*).

**Elastic Modulus**. In a stress-strain curve, the ratio of the load to the extension of the metal, or more properly of the stress to the strain, before the elastic limit is reached. The figure for any particular metal or alloy is much the same, whether the strain is a change in length due to tension or in bulk due to compression. It is usually slightly lower in shear.

**Elastic Recovery**. When a steel is stressed beyond the elastic limit, it becomes plastically deformed. This lowers the elastic limit considerably and a small stress afterwards will produce a plastic change. But after several days the steel recovers its elasticity almost to the original value; this phenomenon is known as elastic recovery and the effect may be speeded up by heating to temperatures between 100–300° C.

**Elaterite**. Brown, rubber-like, bituminous substance of unknown chemical composition and origin. It occurs in joint and other planes in the carboniferous limestone of Derbyshire, the type locality being at Castleton.

**Elatinaceae**. Family of herbs and small shrubs, distributed generally over the globe. They are mostly small annuals, growing in marshes, with opposite or whorled leaves. The minute flowers have two to six sepals and a like number of petals, and the fruit is a membranous capsule, containing many seeds. Some of the plants are acid, known as water-peppers.

**Elba** (Gr. *Aithalia*; Lat. *Iwa*). Island of the Mediterranean, belonging to Italy and included in the prov. of Leghorn. It lies 6 m.

S.W. of Piombino, the nearest point on the mainland, and is 19 m. long by 6 m. broad, with an area of about 90 sq. m. It is wholly mountainous, rising to 3,350 ft. in Monte Capanne, with fertile valleys. The produce of the island includes iron, which has been

worked from antiquity, salt, granite, marble, chalk, and wine. Many of its fisher-folk are engaged in the tunny and sardine fisheries.

The capital is Porto Ferrajo (*q.v.*) on the N. coast, the residence of Napoleon while in exile, May 5, 1814–Feb. 26, 1815. He had also a villa a few miles S.W. of the town and a country house on Monte Capanne. Porto Longone and Rio Marina are among the chief villages. Pop. 26,000.

In 453 B.C. Elba was laid waste by the Syracusans. It has belonged to Pisa, Florence, Spain, Naples, France, Tuscany, and since 1860 Italy. In the Second Great War Elba was garrisoned by Italians until the surrender of Italy in Sept., 1943, whereupon German troops occupied the island. French troops, supported by Allied warships and aircraft, landed at several points on June 17, capturing Porto Ferrajo next day. All organized resistance ceased on June 19. An attempted rescue that night of isolated Germans was frustrated.

**Elbasan**. Town of Albania. On the Skumbi, about 65 m. W. of Bitolj (Monastir), it is one of the few important towns of the country, and is the seat of a Greek bishop. It has hot sulphur springs. During the First Great War it was the headquarters for a short

Elatinaceae. 1. Flowering branch of *Elatine americana*, magnified. 2. Diagram of a dimerous flower. 3. A flower, more magnified. 4. A magnified stamen, outside and inside view. 5. Pistil, magnified. 6. Pistil, vertical section, showing placenta. 7. Transverse section of seed. 8. Magnified seed

time of a government formed by Essad Pasha, the Albanian notable who sided with the Allies. After their conquest of Montenegro and N. Albania, the Austrians occupied Elbasan, 1916-18. It gives its name to a prefecture. Pop. 13,796.

**Elbe** (anc. *Albis*). River of North-Central Europe. It rises in a number of streams which unite at the foot of the Schneekoppe, a lofty summit of the Giant Mts. (Riesengebirge), which extend along the N.E. boundary of Bohemia. From this mountain, at an alt. of 4,500 ft., it flows S. and W. to Melnik, the head of navigation, 21 m. N. of Prague. It penetrates the Mittelgebirge and the Erzgebirge, waters Saxony, and pursues a N.W. trend to fall into the North Sea, near Cuxhaven, through an estuary of 70 m. between Holstein and Hanover.

At its mouth it is nearly 14 m. in width, its length is 725 m., and its drainage area about 57,000 sq. m. It is navigable by small steamers for more than 500 m., as far as its junction with the Moldau at Melnik. The tide is perceptible as far as Geesthacht, about 110 m. from its mouth. Besides the Moldau, the chief of its many tributaries are the Havel, Saale, Eger, and Mulde. The Elbe is linked by a series of canals with the Oder, the Spree, and the Trave, the last, opened in 1900, connecting Lübeck with Lauenburg, Hamburg, Magdeburg, Wittenburg, Torgau, Meissen, Dresden, Aussig, Leitmeritz, and Pardubitz are important places on its banks.

There is an enormous traffic along the Elbe, principally by barges, which are assisted by an ingeniously contrived towing chain. Immense quantities of timber are floated downstream from the forests of Bohemia. Fish include sturgeon, salmon, pike, and shad.

Before the Allies invaded Europe during the Second Great War many towns on the Elbe had been heavily attacked by Allied aircraft, Hamburg and Magdeburg being partially destroyed. In 1945 U.S. armoured formations of the 9th army made a lightning thrust across central Germany to the river, which was crossed on April 12. They established an 85-mile front along the Elbe from N. of Stendal to S. of Magdeburg, which was heavily bombed on April 17 and captured next day. German infantry, supported by tanks, launched counter-attacks at Barby. On April 19 about 10,000 Germans, with tanks, who had been cut off in the Harz pocket, made a surprise attack

behind the American lines in a desperate attempt to break through to the Elbe, one column advancing 15 m. to Koltze.

That day the British 11th armoured division cleared Lauenburg and reached the lower Elbe about 20 m. S.E. of Hamburg, and soon the British controlled a 35-mile stretch of the W. bank. U.S. 1st army troops were N.E. of Dessau by the 24th, and next day contact was established between the U.S. and Russian armies on the Elbe near Torgau. A British force crossed the river near Lauenburg, capturing the town and establishing a bridgehead, while the U.S. 82nd airborne division made another crossing upstream at Bleckede. Between the Weser and the Elbe the Guards armoured division was engaged in clearing the Cuxhaven peninsula.

On April 30 troops of the U.S. 9th army broke out of the Barby bridgehead and linked with the Russians at Apollensdorf. The British and American bridgeheads on the lower Elbe were joined by May 2, controlling 50 m. of the river, while two thrusts were made to the Baltic. On the 3rd the defence system in N.W. Germany collapsed and Hamburg surrendered to the British 2nd army, all German forces in this area surrendering unconditionally to the 21st army group next day. The Guards armoured division entered Cuxhaven on May 7, and the U.S. 9th army withdrew from territory E. of the Elbe in accordance with the demarcation agreement with Russia. Dresden was entered by the Russians on May 8.

**Elberfeld.** This industrial town in N.W. Germany, with its twin town Barmen, is described under Wuppertal (*q.v.*).

**Elbert.** Granite mt. of Colorado, U.S.A. The highest peak of the Sawatch group of the Rockies, having an alt. of 14,421 ft.

**Elbeuf.** Town of France. It stands on the left bank of the Seine, in the dept. of Seine-Inférieure, 12 m. S.S.W. of Rouen. Across the river is the suburb of St. Aubin. The chief buildings are the Renaissance churches of S. Jean and S. Etienne, and the town hall. There is a museum, and several technical and other schools. The main industry is the making of woollen goods. Elbeuf gives its name to a forest around the town, and at one time there was a duke of Elbeuf. Occupied by the Germans in the middle of June, 1940, the town was included in the German-occupied zone after the defeat of

France. It was liberated by troops of the 1st Canadian army, Aug. 25, 1944. Pop. 15,958.

**Elbing.** Town and seaport in what was left from 1919 of West Prussia and embodied with East Prussia. It is on the Elbing river and a canal linking it with the Vistula, 5 m. from the Baltic, in the Frisches Haff, and 45 m. E.S.E. of Danzig. Its main importance was derived from a shipyard, and during 1934-45 from motor-car, locomotive, tractor, and cigar factories; it also had engineering, furniture, and chocolate industries. Founded 1237 by Lübeck merchants around a castle of the Teutonic Knights, it was a member of the Hanseatic League, broke with the Knights in 1454 and accepted Poland's protection, fell to Prussia in 1772, and then recovered part of the importance it was losing to Danzig. The old town had the remarkable R. C. church of S. Nicolas (13th century), S. Mary's (13th-16th), Corpus Christi (13th), S. George's chapel (14th). Elbing had a short-lived prosperity when Hitler started a new navy; torpedo boats and U-boats were built here, and an unfinished aircraft carrier lay in its docks when the town was taken by the Russians on Feb. 10, 1945, after violent street fighting. The town was placed under Polish administration, July, 1945.

**Elbow.** Joint formed by articulation of the lower end of the humerus, or upper arm bone, with the radius and ulna, the two bones of the forearm. The articulation between the ulna and the humerus forms what is termed a hinge-joint, a deep notch in the ulna, the greater sigmoid cavity, gliding backwards and forwards over the trochlear surface of the humerus. The disk-shaped head of the radius contains a depression which articulates with a prominence on the humerus termed the *capitulum*; the edge of the disk articulates with the small sigmoid cavity of the ulna. These articulations permit the rotation of the forearm. The tip of the elbow is formed by a process of bone called the olecranon; the bony prominences, which can be felt on the inside and outside of the elbow when the arm is held with the palm of the hand facing forwards (supination), are the internal and external condyles of the humerus.

**INJURIES TO THE ELBOW.** These may involve both radius and ulna together, or only one bone. The most frequent dislocation of the

Elbow. Diagram showing the three bones forming the joint; above, relations of the bones and muscles

two bones together is backwards, and may be associated with fracture of the olecranon, or the coronoid process, a prominence which forms the lower part of the greater sigmoid notch. This condition is accompanied by pain, swelling, and changes in the relative positions of the bony joints to each other, the forearm being kept partially bent and the hand held midway between supination and pronation, i.e. between complete external and internal rotation. The dislocation can usually be reduced without much difficulty by skilled hands, but patients should not be encouraged to reduce dislocations themselves.

Dislocations of both bones forwards or sideways are much less frequent. When a single bone is dislocated it is more frequently the radius, since the articulation between it and the humerus is less firm and close than that between the ulna and the humerus. In forward dislocation of the radius the head of the bone rests against the front of the lower end of the humerus, which prevents the patient from completely bending his elbow. The surgeon pulls the forearm forwards while it is bent at a right angle, and at the same time presses the head of the bone back into its place.

Sprain of the elbow, or "pulled elbow," is an accident not infrequent in young children, in which

the head of the radius slips down, and one of the ligaments becomes nipped between the radius and humerus. The doctor replaces it by bending the limb and then extending it. Fractures of the bones forming the elbow-joint frequently complicate dislocation. The humerus may be broken across just above the condyles, or either condyle may be fractured.

**DISEASES OF THE ELBOW.** Tuberculosis of the elbow is more frequent in children than in adults. The joint becomes swollen and painful, and chronic abscesses form which may extend to the surface and break through the skin, thus giving rise to a sinus. Treatment consists in keeping the limb at rest and building up the general constitution. Sometimes surgical measures are appropriate. Arthritis of the elbow joint may be the result of septic or gonorrhoeal infection. Synovitis which may be acute or chronic, is inflammation of the synovial membrane which lines the joint. Inflammation and enlargement of the bursa, which lies over the olecranon process, gives rise to the condition known as "miner's elbow."

Tennis elbow is an incomplete tear of the triceps tendon at its insertion on the bone, pain being produced by pressure on the nerve endings of the part. It occurs suddenly when the handling of a tennis racket throws undue strain on the muscle. The treatment is rest and massage after the surgeon has completed the tear. See Arm; Dislocation illius.

**Elbruz** or **ELBURZ.** Highest mountain of the Caucasus. It is a little to the N. of the main chain, in the Kabardin autonomous republic of Russia. It consists of two extinct volcanic peaks, the higher about 18,467 ft. Elbruz was first ascended in 1829. According to tradition, it was the first resting-place of the Ark.

**Elburz.** Mountain range skirting the S. shore of the Caspian. It extends for a length of 600 m., and to a width in places of 200 m., through N.W. Persia. On its N. slopes are fertile valleys, and at various points naphtha and petrol are found in considerable quantities. The highest peak is the volcano, Mt. Demavend (q.v.).

**Elche.** Town of Spain, in the prov. of Alicante. It stands on the Vinalapo, 13 m. by rly. S.W. of Alicante. Of Moorish appearance, with flat-topped white-washed houses, open squares, and narrow streets, the town is nearly surrounded by plantations of date

palms, the fruit being exported as "Barbary" dates. It has an ancient castle of the duke of Altamira, and a handsome church (Santa Maria), with a beautiful blue-tiled dome. An important rly. junction, it carries on a trade in figs, olives, almonds, and exports esparto grass, mats, and rope shoes. Santa Pola, its port, lies 2 m. S.E. At the feast of the Assumption a 14th century religious drama with music is performed. Pop. 33,870. *Pron.* El-chay.

**Elchingen.** Village of Germany, in Bavaria. It stands on the Danube, 8 m. N.E. of Ulm, and is famous for the battle fought there between the French and the Austrians, Oct. 14, 1805. This was part of the campaign that ended in the capitulation of the Austrians at Ulm and their defeat at Austerlitz. The two armies met at the bridge which here crosses the Danube, and which was then in ruins. The French, however, quickly remade it, and the army got across. The Austrians under Mack were already demoralised, only one part of the army stood to fight, and this was hampered by difficulties of every kind. The chief feature was the surrender of a large number of Austrians. Ney was made duke of Elchingen as a reward for his services there. See Ulm, Campaign of.

**Elder** (*Sambucus*). Group of hardy shrubby trees, natives of Britain, of the family Caprifoliaceae.

Elder. A large specimen of *Sambucus nigra* in bloom

Their height is about 10 ft.; the flowers are white and variegated. They can be grown in any ordinary soil in open shrubberies. There are a few varieties of *S.* European origin, but they are rarely seen to advantage in British shrubberies. They are propagated by cuttings in autumn or spring. *S. nigra* is the familiar native elder, the

berries of which are used for the manufacture of home-made wine. A liquid distilled from the flowers, elder-flower water, is used for flavouring confectionery. Owing to its lightness, the pith is made into balls much used in electrical experiments.

**Elder.** Word used in a civil and an eccles. sense for an overseer. Of frequent occurrence in the Bible, in the O.T. it is applied to the heads or representatives of tribes and families, especially of the Israelites, as the word sheikh is among the Arabs. In the N.T. it is used to define officers of the Church who originally may have been identical with the bishops. Certain office-bearers in the Presbyterian and other churches are called elders. The word alderman (*q.v.*) is a familiar English equivalent of the word. See Bishop; Kirk Session; Presbyter.

**Elder Brethren of the Trinity House.** Members of the corporation of Trinity House, Tower Hill, London, E.C., sometimes known as Trinity Masters. They consist of members of the royal family, prominent statesmen, retired naval officers of high rank, and commanders in the mercantile marine. Nine active Elder Brethren, when required, assist the judges of the admiralty division as nautical assessors in shipping cases. The tenth, deputy master, does not act as an assessor. See Trinity House.

**Elder Dempster Lines.** British steamship line. It was founded in 1868 by Alexander Elder and

of motor vessels. It lost 25 ships out of a fleet of 41 during the Second Great War. The head offices are at 3, Linnet Lane, Liverpool, and the London office at Fenton House, Fenchurch St.

**Eldon, JOHN SCOTT, 1ST EARL OF (1751-1838).** British lawyer. He was born at Newcastle-upon-Tyne, June 4, 1751, son of a coal merchant. He was educated at the town grammar school, and University College, Oxford, where he was for a time a tutor. He did not, as at first intended, enter the Church, but in 1776 was called to the bar and soon began to practise in London; in 1782 he became a K.C.

That year Scott entered parliament as M.P. for Weobley. He forced himself into notice by frequent speeches, and in 1788 Pitt made him solicitor-general. In 1793 he was promoted attorney-general, and in 1799, having conducted the prosecution of Horne Tooke and others holding republican ideas, he was made chief justice of the court of common pleas, and a peer, as Baron Eldon. Lord chancellor from 1801, he left the post on Pitt's death in 1806, but in 1807 returned to fill it for 20 years, a longer period than any other chancellor. He was the most powerful man in Lord Liverpool's reactionary cabinet, and his methods are a classical example of caution and dread of innovation. He resigned in 1827 and died Jan. 13, 1838.

Eldon married Elizabeth Surtees, the daughter of a banker, having run away with her in 1772. His two sons died before him, and his titles—he had been made an earl in 1821—passed to his grandson John (1805-54). A descendant, John (b. 1899) became 4th earl in 1926. The eldest son is known as Viscount Encombe. Eldon's elder brother, William Scott, a distinguished lawyer, was in 1821 created Baron Stowell. Consult Lives of the Lord Chancellors, Lord Campbell, 3rd ed., 1848.

**El Dorado** (Span., The Gilded One). Name successively applied to a gilded man, a golden city known as Manoa or Omoa, and a region abounding in gold and precious stones, reputed to exist

in S. America. The El Dorado legend apparently originated in a custom said to have been observed by an Indian tribe dwelling on the tableland of Bogotá at the installation of a new chief. His naked body, after being smeared with balsam, was covered with gold-dust, and he plunged into the sacred lake of Guatavita, whilst the assembly cast gold and precious stones into the water.

The Spaniards in America put such faith in the El Dorado legend that the governors of Guiana were styled also governors of El Dorado. They organized many fruitless expeditions in search of the legendary city, Manoa, the earliest being led by a German governor of Guiana, Ambrose Dalfinger, in 1529. In 1595 Sir Walter Raleigh claimed to have located Manoa on an island in Lake Parima, but this lake was proved by the 19th century German traveller, von Humboldt, to be non-existent. The name El Dorado came to be applied to any place reputed to abound in easily acquired wealth.

**Eleanor of Aquitaine** (c. 1122-1204). Queen of Henry II of England. The eldest daughter of William, duke of Aquitaine, her first husband was Louis VII of France, to whom she was married in 1137. Her dowry was the great duchy of Aquitaine. In a short time Eleanor and Louis were on bad terms, and in 1152 the marriage was dissolved. In the same year she married Henry of Anjou, who became king of England in 1154. She was the mother by Henry of the quarrelsome princes who disturbed his reign. Indulgent to them, the queen was concerned in the revolt of 1173. She moved about in France trying to help John in his fight against Richard I. She died April 1, 1204. Consult Life, C. B. Reed, 1928.

**Eleanor of Castile** (d. 1290). Queen of Edward I of England. The daughter of Ferdinand III, king of Castile, she was married to Edward in Oct., 1254. She fled to France in 1264 when her husband was worsted by the barons, and was in Palestine with him in 1270. She died at Harby, Notts, Nov. 28, 1290, and was buried at Westminster. The king erected crosses, known as Eleanor crosses, at the places at which her body rested on the journey—Lincoln, Grantham, Stamford, Geddington, Northampton, Stony Stratford, Woburn, Dunstable, S. Albans, Waltham, Westcheap, Charing Cross. Consult Queens of England, A. Strickland.

*Eldon*

Elder Dempster Lines flags. Left, African Steamship Co. Right, British and African Steam Navigation Co.

John Dempster, and reorganized as a registered company in 1910. It manages the African Steamship Co., and the British and African Steam Navigation Co., which have maintained passenger and cargo services to West Africa since 1852, and also the Elder and Imperial Direct Lines. Principal services are from Liverpool and London to the Continent and W. Africa; New York to W. Africa; and Canada to South Africa, the last being operated by Elder Dempster Lines (Canada) Ltd. The company has been a pioneer in the use

**Eleanor of Provence** (d. 1291). Queen of Henry III. of England. The daughter of the count of Provence, she was brought up amid the poets and troubadours there. In 1236 she was married to Henry at Canterbury. Throughout her residence in England she was most unpopular. The charges against her resolve themselves into a love of foreign relatives and avarice. In 1276 she entered a religious house at Amesbury, where she died June 25, 1291. *Consult* Queens of England, A. Strickland, vol. i, 1840.

**Eleatic School.** One of the chief pre-Socratic Greek philosophical schools. It was founded by Xenophanes of Colophon at Elea in Lucania in lower Italy; its other chief representatives were Parmenides and Zeno (both of Elea), and Melissus of Samos. The kernel of their doctrines was the unity and unalterableness of Being (that which really had a right to the name of existence), the unreality of Becoming (material changes), of Plurality, and of sensual perceptions. The real nature of things, they held, cannot be perceived by the senses, but is attainable only by thought. All that is given us by the senses is mere appearance. Since the senses show us only plurality and the manifold, and since the separate parts of the world, such as it presents itself to our senses, both differ in themselves and are subject to constant change and movement, they asserted that Being was only one, unchangeable, and immovable. Only Being is; non-Being is not; there is no Becoming. Starting from the assumption that the idea of real Being excludes anything contradictory, the Eleatics argued that Plurality, and above all Movement, could be neither Being itself nor found in connexion with Being.

**Election** (Lat. *electio*, choice). Term used in English law. A man has sometimes to choose which of two courses he will take. Thus, if A. B. sells me first quality oats and delivers second quality, I can either reject them altogether or keep them and pay for them, counter-claiming for breach of warranty of quality. But I cannot keep the oats and decline to pay. If I do not forthwith reject them I have *elect*ed to keep them. Again, circumstances sometimes arise when one has to choose, or elect, whether one will retain the benefit of a gift *inter vivos* (among the living), as, for instance, under a marriage settlement or a deed of appointment;

or give it up and take a benefit under a will. Election implies knowledge; that is, a man can elect only where he knows his rights.

**Election.** Term used in theology for the doctrine that God from eternity has chosen certain persons for eternal life. In the O.T. the term elect is applied to the Israelites, as the chosen people of God. In the N.T. the members of the Christian Church are called the elect in 1 Peter 2, and in S. Paul's epistles to Thessalonians, Colossians, and Timothy. The Calvinistic view that God has elected certain persons to be saved and others lost, and this solely by His own will and irrespective of any merit or demerit in the individuals, was never held before the Reformation. The usual view was to identify the elect with the baptized, in the sense that they had been chosen and called to a Christian profession; but to recognize the possibility of falling away from such a profession. Only those who persevered in Christian living to the end could be regarded as the people whom God had foreknown and chosen from the beginning as His faithful followers. The Catholic Church has never maintained that election of the faithful implied condemnation of those denied the opportunity of election.

**Election.** In politics, and to some extent in business, the choosing of representatives. The methods of election vary, but usually a bare majority of votes is sufficient to secure election, although this may be either a majority of the votes cast, or a majority of those entitled to vote.

The first elections were decided by the casting of lots, a method in force among the Greeks and Romans, but later ideas were averse to this. Election by the votes of the electors began with the growth of the idea of representation. In the 12th century, perhaps earlier, the reeve and four men represented the village communities of England on occasions, and in some rough manner these four men were elected by those for whom they spoke. The system grew with the growth of parliamentary institutions; knights of the shire, and burgesses for the boroughs, were elected, as well as other officials. Until modern times the method was rough; those present held up their hands, or shouted, much as they do at a public meeting today, and it was the sheriff's duty to declare which men were thus elected.

There is proof that the sheriffs abused their power, declaring the election of persons not rightly chosen, and checks upon them were introduced. For parliamentary elections there came in the method of open voting on the hustings (*q.v.*) and then the present system, which belongs to the 19th century. It includes voting by ballot, a careful enumeration of the votes cast, and, if necessary, a scrutiny and recount; indeed, every possible device to secure that the wishes of the voters prevail.

British parliamentary elections are divided into general and by. A general election is one held at a stated time after the dissolution of parliament. A by-election takes place when death or some other cause renders a seat vacant. In elections for many local bodies, *e.g.* town councils in England, it is customary for one-third of the members to retire every year, so there is never a general election. County councils in England have a full election every third year.

There is a fundamental division between direct and indirect elections. In the former the voters themselves choose their representatives, each voter having as many votes as there are members to be elected. Elections to the house of commons are the best known of this kind. At indirect elections the electors choose certain men who, in their turn, elect the actual representative. The most notable existing instance of this kind is the choosing of the American president by a college of electors. The Venetian republic had an elaborate system of indirect election when choosing a doge. The election of aldermen in English boroughs and county councils is a somewhat different kind of indirect election; they are chosen from among themselves by the directly elected councillors, who are not, however, returned solely, or even mainly, for this duty.

Elections at the best are but a crude test of the people's will, so vast are the numbers engaged, and so great the possibilities of manipulation. It has happened more than once that a minority of voters return a majority of members to the British house of commons. To make this impossible, and also to secure the representation of minorities, various proposals—proportional representation, second ballot, alternative vote—have been put forward.

At elections of company directors a show of hands is usually sufficient, but, under certain con-

ditions, those dissatisfied with the decision can demand a poll. In elections of this kind, unlike political ones, the shareholders have votes in proportion to their interest in the company. A further device prevails at elections of members to clubs and societies. There a small number of members can keep out a candidate by voting against him; this is called blackballing, from the practice of using black balls for this purpose. Election is the term used for the choice of fellows or scholars at the colleges of Oxford and Cambridge. Professors are also usually elected. See *Alternative Vote*; *Ballot*; *General Election*; *Hustings*; *Proportional Representation*; *Vote*.

**Electoral Commission.** Name given to the body of men created by an act of Congress in the U.S.A., Jan. 29, 1877, to settle certain disputed questions in connexion with the electoral votes of four states in the presidential election of 1876. It was the only disputed election in American history. It was decided to create a commission to determine which of two or more conflicting certificates received from any state of the votes cast by the electoral college of such state for president and vice-president in the 1876 election was the certificate provided for in the constitution. The judgement in each case was that the certificate of the votes cast for Rutherford B. Hayes and William A. Wheeler, the republican candidates for president and vice-president respectively was the certificate containing the lawful electoral vote of the said state. The other certificates were declared void. The electoral votes were then counted, and Hayes and Wheeler were declared elected.

**Electoral Roll.** List of electors in a parish of the Church of England. They may be of either sex, but not less than 18 years old, baptized, and declaring themselves to be members of the Established Church and of no other religious body. If residing in another parish, a person can qualify by attending for one year at public worship at the church. Duties are exercised at the annual parochial church meeting.

**Electoral Truce.** Cessation of rivalry at the polls between opposing political parties. In a three-cornered fight at an election the two parties most closely related politically may come to an arrangement by which one will agree not to contest the seat, thereby avoiding splitting the votes. The term was also used

during the Second Great War to indicate that parties which broadly supported the National government would not oppose one another at by-elections.

**Electors.** Term used in two special senses. (1) The German princes who in the Holy Roman Empire voted at the election of the king. Like many other early peoples, the Germans elected their kings; but, unlike them, they retained this practice—at least, in theory—until modern times. These elections may be said to have begun with the choice of Conrad I as king in 911, but it was often merely a form, the eldest son of the late king being confirmed as ruler, as was Otto the Great. The electors were powerful when there was no obvious successor to the throne, two or more candidates claiming it, as in 1198, and more so after the death of Frederick II in 1250. At first all the princes took part, or were entitled to take part, in the elections, but soon many of them ceased to attend. In 1257 the number taking part was seven. This number became fixed, was recognized by the pope, and at Aix-la-Chapelle statues of the seven were erected.

Trouble then arose as to who were the favoured seven. The archbishop of Mainz and the elector palatine of the Rhine were acknowledged to be electors, but in other cases there were difficulties, especially when two men divided a duchy between them. The matter was settled in the Golden Bull issued by Charles IV in 1356, which fixed the number at seven, who were named. Three were archbishops—Mainz, Cologne, and Trèves—and the other four were the elector palatine, the duke of Saxony, the margrave of Brandenburg, and the king of Bohemia. Each held an office at the emperor's court. The clerics were archchancellors for his three kingdoms, Germany, Italy, and Burgundy; the elector palatine was his steward, Saxony his marshal, Brandenburg his chamberlain, and Bohemia his cupbearer. The archbishop of Mainz was president of the electoral college, and on the death of a king summoned the electors to Frankfurt.

The power of the seven electors was greatly increased by the Golden Bull. They were made almost sovereign rulers, with privileges not enjoyed by the other princes of Germany. They formed a college, one of the three sections of the imperial diet. The com-

position of the college remained unchanged until 1623, when the elector palatine lost his vote, which was given to the duke of Bavaria. In 1648 he was restored as an eighth elector. A ninth electorate was created in 1708 for the ruler of Hanover, and this was held by George I and other English kings. To keep up the old theory these new electors also held offices, the elector palatine being treasurer and Hanover standard-bearer. In 1778 the ruling family of Bavaria became extinct, and the elector palatine secured its lands, thus uniting two votes. In 1806, with the dissolution of the empire, the electors ceased to exist. (See *Empire*; *Germany*; *Golden Bull*.)

(2) In the U.S.A., persons chosen by popular vote to elect the president. In Nov. of every fourth (leap) year, voters throughout the U.S.A. go to the polls to choose the electors whose sole task it will be to give their votes at their respective state capitals in Dec for the presidential candidate approved by their party. Each state chooses as many electors as it sends senators and representatives to congress. Theoretically, an elector is left free to vote for the candidate whom he honestly thinks is the best man; but in practice it is inconceivable that a Democratic elector could vote for a Republican candidate, or vice versa. Whatever the balance of votes in the electoral college of any one state, the whole quota of that state's votes is cast in favour of the candidate chosen by the majority of electors. The vice-president of the U.S.A. is elected by similar machinery.

**Electra.** In Greek mythology, daughter of Agamemnon and Clytemnestra. She incited her brother Orestes, when he grew up to manhood, to murder his mother, Clytemnestra, in revenge for the latter's murder of his father on his return from Troy. The tragic life of Electra forms the subject of tragedies by Sophocles and by Euripides. See *Agamemnon*; *Clytemnestra*; *Orestes*.

**Electrical Engineers, INSTITUTION OF.** British organization founded as The Society of Telegraph Engineers in 1871. Its name was afterwards changed to The Society of Telegraph Engineers and Electricians, and finally, in 1889, to its present designation. It was incorporated by royal charter in 1921. The institution has many local centres and sub-centres in Great Britain and N. Ireland, and branches in Eire, Argentina,

China, Calcutta, and Ceylon. London address, Savoy Place, W.C.2.

**Electrical Units.** Units used to indicate the values of electric pressure, the volt; current intensity, the ampere; resistance, the ohm; and power, the watt. Each of these units is described under its own heading. See also International Units; Ohm's Law.

**Electric Arc.** A luminous discharge of electricity through a conducting medium such as air or gas which is in a state of ionisation (*q.v.*), thus rendering it temporarily conducting; or such a discharge in a conducting medium formed by a bridge of minute particles of its own electrodes heated to incandescence. Examples of the former are seen in the luminous discharges in fluorescent lamps, where the arc is conducted by ionised atoms of mercury, sodium, or other vapour at a low pressure. The best-known example of the second type is the ordinary carbon arc lamp.

An arc once established can be maintained by a difference of potential between electrodes of as little as 30 volts, and should not be confused with an electric spark, which actually jumps or breaks down a gap between two electrodes and requires several thousand volts to break down a gap as short as a millimetre. Arcs may be desirable phenomena or quite the reverse. In the carbon arc lamp used in cinematography, in the arc furnace for melting metals, and in the arc type of electric welding (*q.v.*), the production and maintenance of the arc are the primary object. In switching operations, the arc is highly undesirable because of its extremely high temperatures and consequent destructive effect.

**Electric Charge.** Term used for certain states of electrification of a body. When two substances (insulated if conductors) are pressed hard or rubbed together and then drawn apart, they are found to have developed properties which they did not apparently possess before, the most striking being the power of attracting each other and light particles of other substances. They have developed or acquired an electric charge and are said to be electrified.

All bodies seem able to develop or acquire such a charge more or less, but if different substances so charged be examined the remarkable fact emerges that, while the charges have certain properties in common and act in accordance with the same laws, there are two

different kinds, one kind being developed by certain classes of substances and the other by other classes, with this qualification, that either kind may be developed on some substances according to the material with which they are rubbed. The two kinds of charge are represented by that developed on a glass rod when rubbed with silk, and by that produced on a stick of resin when rubbed with fur or wool, the former has received the name of positive electricity and the latter that of negative electricity. Another remarkable characteristic of these charges is that one is never developed by itself but both are always produced at the same time, one kind being found on the body rubbed and the other kind on the material with which it is rubbed. See Electricity.

**Electric Discharge.** Literally, an escape of electricity from a charged conductor; but in practice the term is limited to a discharge that travels through a gas at normal or rarefied pressures. The earliest discharges were those passing through or into the atmosphere; *e.g.* from an electrified cloud, or from the metal cylinder of an electrical machine, two versions of the same phenomenon differing only in scale. Three types of discharge are recognized in both instances:

(1) Spark discharge, or lightning in the natural example. This is a sudden release of energy between oppositely charged conductors caused by the breakdown of the insulating air between them.

(2) Brush discharge, a short bright streak coming from the positive electrode and splitting up into many branches, which grow fainter as they leave the parent stem until they finally disappear in air. It occurs when the voltage is less than sufficient to spark.

(3) Glow discharge, or corona, observed when the diameter of a conductor or part of it is so small relatively to the voltage of the charge that the air in contact with the surface continuously breaks down; the discharge resembling a thin coating of luminous fur.

To these must be added the fourth type of discharge which passes through a rarefied gas, consisting of a stream of electrons and seen in nature as the aurora. When it occurs in a vacuum tube which is being exhausted, a continuous band of light first appears between the electrodes, produced by frequent collisions between the electrons and the remaining gas molecules, and known as the positive

column. At lower pressure this breaks up into striæ, and disappears at about a millionth of an atmosphere. The electron discharge has now become invisible, but causes the glass to fluoresce. So-called fluorescent lamps are a practical application of this principle. See Electronics; Gas-Discharge Tube; Neon Lamp.

**Electric Fish.** Group of fishes possessing the power of administering an electric shock. There are three kinds, these being, in the order of their electrical strength, the electric eel (*see* Eel, Electric), the African catfish, and the torpedo, a species of ray.

The electric catfish (*Malapterurus electricus*) is found in all the larger rivers of Africa, the finest and most powerful occurring in the Nile. It frequents the darker and more sluggish portions of the streams, where it kills or stuns other fish, which it eats. It is found up to four feet in length. In some catfish the electrical power seems present all over the body, in others just under the skin at each side.

The torpedo or electric ray is the most numerous of these fish. A considerable number of species occur in the warmer seas of the world, at least two near the southern shores of the U.S.A. The best known is the *Torpedo marmorata* of the southern shores of Europe and of the Mediterranean; large specimens may weigh 80 lb.

The muscles and the nerves concerned in the exercise of the electrical power of these fish are known; but the source of the power and how the organisms become charged with it is not known. Its exercise evidently calls for much nervous force, as after a powerful shock or a series of shocks has been given the fish is exhausted, and must have rest.

**Electric Furnace.** A furnace heated by electric power. Davy may be said to have used the first electric furnace in the production of metallic sodium and potassium. In 1839 Hare made graphite and calcium in a small electric furnace. But not until there was available an abundance of electrical power were such furnaces practicable in industry. Localisation of heat, lack of fumes, shortened times for heating, fewer heat losses, and high temperatures, limited only by fusing of the furnace refractories, are among the many advantages. But it is essential to have sources of cheap electrical power. The electrical energy is used wholly for heating except in electrolysis of fused salts. Small laboratory

furnaces are usually heated by resistance, but this method is not economical on the large scale. The material itself may act as the conductor and its own resistance will cause the heating. More commonly a conductor of high resistance is built into the furnace and the charge is heated indirectly. Tube furnaces with a platinum or nickel chrome wire wound round the tube are used for analytical and laboratory work. Silicon carbide rods can be used as resistors.

#### Furnaces for Alloy Steel

Large electric furnaces used for alloy steel manufacture are usually of the arc type. These depend on the following principle: if two electrodes are brought into contact, current begins to flow; if the electrodes are then moved slowly apart, the current continues to flow across the gap, being carried by vapour, volatilised from the heated tips of the electrodes. If the distance becomes too great the current no longer flows. Carbon, which volatilises at about 3,500°C., is commonly used for electrodes. Alternating current is used and furnaces have been designed for single-, two-, or three-phase operation. Indirect arc furnaces have electrodes through the sides, the charge being heated by radiation.

For non-ferrous melting some furnaces similar to those used for steel are often employed in Europe. The rocking arc furnace, in which an arc is struck between two electrodes inserted through the ends of the furnace, which is rocked continually, is common in America.

The most suitable, however, are low- and high-frequency induction furnaces. Brass is melted for the rolling mills in a low-frequency furnace of the Ajax-Wyatt type, which operates on the transformer principle. A primary coil is inserted in the bottom of the furnace and molten metal is run into a channel round it to form the secondary coil. The top of this ring is open into the body of the furnace and when the current passes it becomes rapidly heated, the hot metal circulating into the cold charge. High frequency furnaces employ comparatively weak magnetic fields at frequencies between 500 and 2,000 cycles per second or higher. The iron core can be dispensed with and the body of the melt is itself the secondary. If the melt is a non-conductor, a conducting crucible is used. The induced current gives efficient and rapid heating and the field of application is wide. These furnaces are also used for special steels.

## ELECTRICITY: GENERAL INTRODUCTION

S. G. Blaxland Stubbs, Gen. Ed. The Electrical Encyclopedia, and A. J. Drummond, F.R.Met.S.

*This article is presented as an introduction to a vast subject of ever increasing importance in industrial, scientific, and domestic life. It is followed by a group of articles on varied special applications of electricity. Many others are distributed throughout the work under such headings as Alternator; Battery; Current; Dynamo; Radio; Transformer, etc.*

Electricity (from Gr. *elektron*, amber) has been known to man since Thales of Miletus (c. 600 B.C.) noted that amber, jet, and a few other substances, when rubbed, attracted to them other light objects, such as dry leaves, straw, or feathers. They were, in fact, electrified.

The first experimental researches were made by Dr. William Gilbert of Colchester (1544-1603), physician to Queen Elizabeth. He made detailed studies of the property of attracting light substances which certain materials acquire after being rubbed with silk, dry flannel, etc. He applied the term "electric" to this property, and first showed that the earth itself is a magnet.

From Gilbert's day to the mid-18th century the researches of English, German, and French scientists and experimenters established the main facts of static electricity, as it was called. Otto von Guericke, of Magdeburg, invented the first electric "machine," in which sulphur balls mounted on a shaft, rotated and rubbed by the operator's hand, produced electric sparks. Stephen Gray showed that some substances conduct electricity while others do not; and in France, C. F. de C. Du Fay distinguished between positive and negative charges, believing that they were due to two different kinds of electricity. An excess of positive was "vitreous" fluid, producing positive electrification, and an excess of negative was "resinous" fluid, producing negative electrification; equal amounts resulted in neutrality.

#### The Leyden Jar

Sir William Watson in the mid-18th century and Dr. John Bevis made the Leyden jar, still to be seen in classroom and laboratory demonstrations. It was a glass jar, coated inside and outside with tinfoil, which could be given a heavy electric charge on the inner coating, the outer coating being then oppositely charged. This had been conceived in its simplest form by Kleist and Musschenbroek, of Leyden. Watson showed that gunpowder can

be exploded by a spark from the jar, and found that electricity travelled apparently instantaneously from one end to the other of a 2-mile wire.

Thirteen years after the death of Du Fay, Benjamin Franklin carried out in 1752 his demonstration of the identity of lightning with the electric spark. He and Kinnersley, in America, also postulated the dual quality of electricity; and Franklin's terminology was ultimately adopted, referring to bodies as positively or negatively electrified. Franklin, however, maintained the one-fluid theory of electricity, considering that all bodies possessed a normal amount of electric fluid, positive being an excess and negative a deficiency of this amount. This theory held the field almost undisputed until Sir J. J. Thomson, nearly 150 years later, demonstrated by the electron theory that negative and positive are two separate kinds (electrons and protons).

#### Coulomb's and Ohm's Laws

Later in the 18th century the mathematical theory of electricity began to be developed by Coulomb in France and Cavendish in England. Coulomb's law, that the force of electric attraction between bodies varies inversely as the square of the distance, was in fact discovered first by Cavendish; the latter also anticipated by nearly 50 years the fundamental law of flow of electric current now known as Ohm's law. G. S. Ohm published between 1825 and 1830 the results of his investigations on the connexion between the strength of a current in a conducting wire and electro-motive force. At the beginning of the 19th century a major discovery was made by Alessandro Volta, of Pavia. He showed that an electric current can be produced from a series of zinc and copper plates separated by cloths moistened with acid or salt if the first pair be joined to the last pair by a wire. This was the first electric primary battery; and the basic principle remains unchanged. It was called the Voltaic pile, or sometimes the galvanic cell, from Luigi Galvani's previous experiments in animal electricity.

The unit of electric pressure (volt) was given Volta's name.

Another big step was made by Hans Oersted of Copenhagen, who discovered in 1830 that a magnetic needle was deflected by an electric current, thus confirming the relation hitherto only suspected between magnetism and electricity. André Ampère (whose name was later given to the unit of quantity of current) extended Oersted's work, and with D. F. Arago worked out the fundamental laws of electrodynamics.

In 1831 Michael Faraday discovered the principle of electromagnetic induction, *i.e.* the production of electric currents by variations in electric field strength and of magnetism by current changes. He also discovered self induction and the transmission of electric forces through a theoretical medium, instead of the old "action at a distance" concept. Faraday's work made possible the electric motor, dynamo, and alternator, and all machines and instruments depending upon electro-magnetic induction. Upon Faraday's fundamental conception the whole vast edifice of electrical engineering is based.

Faraday's theory of the transmission of electric force was developed by James Clerk-Maxwell on a mathematical basis. He not only showed that light, heat, and electric waves were similar in nature, but predicted the transmission of electric waves through space. Rudolf Hertz of Karlsruhe in 1888 generated and detected such electro-magnetic waves, a work that was brought to fruition in the beginnings of wireless by Lodge and Marconi.

#### Discovery of the Electron

Sir J. J. Thomson, experimenting on discharges in vacuum (cathode ray) tubes, demonstrated in 1897 the existence of the ultimate particles of electricity now known as electrons. He measured their mass and determined their charge. Then by postulating the existence of the positive nucleus he led to the fundamental discoveries of the structure of the atom which, through the work of Kelvin, Crookes, Curie, Rutherford, Soddy, etc., led to the splitting of the atom and the release of atomic energy.

Among inventors, as distinct from physicists and experimenters, should be mentioned Humphry Davy (arc lamp), Alexander Bell (telephone), Edison and Swan (with others, electric light), Gramme (dynamo), Tesla (induction motor), and Röntgen (X-rays).

**MODERN DEVELOPMENTS**  
Electricity is a form of energy, probably fundamental, due according to accepted theory to the movements of particles (*i.e.* free electrons). On this theory electricity, electro-magnetism, and magnetism are basically similar in nature and interdependent in action.

The electron theory supplies the most satisfactory explanation of the bulk of electrical phenomena, and an acquaintance with it assists in the grasp of everyday terms and conceptions. Briefly, the atom is supposed to consist of a central nucleus of positive electrification (proton) surrounded by varying numbers of negatively electrified particles (electrons) moving in orbits. In a solid body, such as one which is said to conduct electricity, some of the electrons are sufficiently free of their atoms to move about in the spaces between the atoms. If these free, or loose, electrons move in one direction an electric current is produced in the conductor.

#### The Flow of Electricity

For practical purposes we are concerned therefore with streams of these particles of electricity, and we can speak accordingly of a flow of electricity (or current), and to that extent regard electricity as a fluid. A body is electrically charged when it has either less than its normal quantity of negative particles or more. It then has a tendency to revert to the neutral (or uncharged) condition by yielding or receiving electricity to or from a neighbouring body. Thus we get a flow (or current) of electricity. Electric currents are said to be negative or positive, according to direction of flow.

Electro-magnets in motion produce electric currents (dynamos and alternators); and electric currents in motion produce magnetic power (electric motors). Electric currents are also generated by heat applied to certain pairs of dissimilar metals (thermo-couples).

Electric actions are reversible: as magnetic action produces electric currents and vice versa, so electric currents produce chemical action (electrolysis) and vice versa.

**CONDUCTORS.** A current of electricity, like one of water, must have a definite channel along which to flow, this channel being its conductor. Materials vary widely in their capacity to convey electric currents, some having high conductivity, like silver, copper, aluminium, iron. Other materials have lesser degrees of conductivity, and those over which elec-

trification spreads extremely slowly are described as non-conductors or insulators. Water and all metals are conductors, while gases, glass, shellac, india-rubber, silk, wool, and sulphur are non-conductors. Living organisms are conductors, since all contain watery fluids. A material is a non-conductor in proportion to the amount of resistance it offers to electric flow, and this resistance is measured in ohms. In general, resistance increases with temperature.

Straying or leaking current is dangerous to human life and property. The insulation must be guarded from damage by various forms of covering (*see* Cable). Circuits must be further protected by automatic arrangements to cut off the current if it rises to dangerous levels, causing risk of fire and explosive effects.

Certain lead and tin alloys are used in domestic circuits as fuses; they are short lengths of wire which will melt quickly and break (or open) the circuit when the current in it increases to a point near the limit of the capacity of the conductor or cable. On larger circuits, switches (called circuit breakers) designed to open instantaneously on abnormal current rises serve the same purpose.

Some conducting materials conduct better in one direction than the other, and this phenomenon is applied to the rectification of alternating currents.

**THE CIRCUIT.** An electric current will flow if its path forms a complete circuit from and back to the generator, whether the generator is a battery or a dynamo. Every piece of apparatus, lamp, bell, motor, etc., served is included within the circuit in one of two ways—either in series or in parallel. If in series the current travels in a direct path through each piece of apparatus; if the apparatus is connected to the circuit in such a way that each piece has its own sub-circuit, it is said to be in parallel. A circuit is said to be closed if no gap exists, and when continuity is broken the circuit is said to be open. When open, as by opening a switch, no current can flow. The earth may be used as part of a circuit as in some electric traction systems.

#### The Volt and the Ampere

The flow of a current must be forced around a circuit by some sort of pressure. The unit by which this pressure is measured is the volt, and the unit by which the amount of current is measured is the ampere.

When the motion of the negative electron as distinct from a positive charge is considered, current flow is said to be from the negative to the positive. Potential difference between two charged bodies forces the electric current to flow from the higher to the lower in just the same way as heat flows from a hot body to a colder one; and if there is no difference in the potential of the two charges there can be no flow.

**D.C. AND A.C.** Current is generated and transmitted as direct or continuous (D.C., or more correctly C.C.) or alternating (A.C.), the first from dynamos (*q.v.*) and the second from alternators (*q.v.*), or A.C. generators.

In earlier days the first form was usually employed, but as A.C. is more readily and efficiently generated and transmitted at high voltages, and can be transformed without moving machinery down from high to low voltages for domestic and industrial purposes, it has in most countries come into general use. In Great Britain a central grid system interconnects the power (generating) stations and distributing centres of all "authorised undertakers" of electricity supply. Current is largely transmitted at 132,000 volts (132 kV), and also at 66,000 and 33,000 volts in ten districts, being transformed down at sub-stations for local use. Up to the passing of the Act of 1947 nationalising the generation and transmission of electric power in Great Britain, domestic supplies were in general standardised at 230 volts, with a frequency of 50 cycles, though in some districts other voltages (such as 100, 240, and 400) were used, with varying frequencies such as 25, 60, or 100 cycles. Standardisation at 240 volts was part of the plan under nationalisation. In the City of London and a few other centres D.C. was still used.

#### Cycles of Frequency

The cycle of frequency refers to the period of time taken by an alternating current (*q.v.*) to flow in one direction from the generator through the circuit back to the generator. In an alternating current generator the direction of the current flow changes so many times per second, according to the type of generator. Standard current flows in one direction for  $\frac{1}{50}$  sec. and then reverses (*i.e.* 50 cycles per second). Since electricity flows at the speed of light (186,000 miles per sec.), this alternation is, for practical purposes, instantaneous in all working

circuits. The frequency of radio waves varies from thousands of cycles per sec. to millions of cycles per sec.

**DANGERS FROM ELECTRICITY.** Shocks which may be very serious, even fatal, may be received from ordinary house supplies, if electricity is wrongly handled, but it is safe if correct methods are used. If a man touches an electrified material and at the same time is in contact with another conductor, the current will pass through his body, since his body then forms part of the closed circuit. But if he touches an electrified material and no part of his body is in contact with a second conductor the circuit is open and current cannot flow.

#### Current Versus Resistance

The fact that current flows because of a potential difference between two charged bodies—and the greater the difference the greater the current—could be expressed by saying that the amount of current passing through a circuit at a given moment depends on the force generated (or voltage of the current) and on the resistance of the conductors. If a house circuit at 230 volts is short-circuited to earth through a good conductor such as a water pipe, the current encounters negligible resistance and the P.D. is from 230 to zero or earth potential, less the small resistance of the pipe, etc. If a man is standing in wet boots on a wet floor he forms part of a very low resistance circuit. If then he touches a live connexion, his body will convey the full voltage and full amperage, and even in a 230-volt circuit such a shock has proved fatal, since the current may easily rise to 50 or 100 amperes.

If, on the other hand, he is standing in dry boots on a dry carpet and he touches the live connexion, it is probable that only a part of the current will pass through his body, since the dry boots and dry carpet being of high resistance allow a much smaller amount of current (*i.e.* amperage) to pass. If he were in rubber boots or standing on a dry rubber mat he would receive no shock, since rubber is a non-conductor and there would be no P.D. The rubber acts in the same way as an open switch in breaking the circuit.

**EARTHING.** As the earth is a good conductor, and is regarded as being at zero potential it would seem that the simplest circuit for larger systems could be formed by allowing the current to return to the generator through the earth;

but if that method were used the current would tend to follow the underground paths which are provided by water pipes, telephone, and other cables. In time the pipes and cables would suffer from destructive electrolytic action; stray earth currents cause such action in everyday practice. However, earth is used as a safety device. If through faulty insulation parts of a structure become electrified they will be a source of danger unless properly earthed.

S. G. Blaxland Stubbs

**ATMOSPHERIC ELECTRICITY.** Although early investigators believed that lightning and the electrical discharge were related, it was not until the middle of the 18th century that Benjamin Franklin showed their close connexion by his famous experiment of drawing electricity from the wire of a kite. This was possible owing to the large difference of electrical potential between the ground and the air at the level of the kite. The electrical manifestations of the atmosphere are most spectacular in the form of a thunderstorm; but even on the calmest days the atmosphere is always electrically charged. The earth is not an electrically neutral body; it is charged negatively, and in undisturbed conditions the charge in the air is positive. As we rise above the earth, the potential increases to the extent of about 150 volts per metre of height in the lower layers of the atmosphere. This gradient diminishes with altitude, but the actual potential goes on increasing, and at the levels attained by aircraft it may be hundreds of thousands of volts. Hence the "sparking" danger to tethered balloons flying at levels where the difference between the potential of the balloon (*i.e.* earth) and the atmosphere is great.

#### The Potential Gradient

The change of electrical pressure or potential per metre is called the potential gradient, which is thus representative of the strength of the electric field. Near the ground the potential gradient is measured by exposing a collector connected to a suitable electrometer. This collector may take the form of an insulated wire carrying a burning fuse or a radio-active agent, which increases the conductivity of the air, making it possible for the potential at any instant to be picked up by the wire and transferred to the electrometer where the voltage acquired can be read. In fine weather the higher potential is at the greater height and

the gradient is said to be positive. The gradient shows regular changes throughout the day and throughout the year. At many places on land there are two maxima and two minima during the 24 hours; over the oceans there is only one maximum and one minimum. The former variation is with local time and is related to the smoke pollution from large towns, while the latter is one of universal time and has been shown to be in phase with the diurnal variation of thunderstorm activity over the earth.

Fog or smoke increases the value of the normal gradient; high negative fields are produced in dust storms; rain or thunderstorms can cause great fluctuations. When the electric field is strong an electric glow or brush discharge takes place from pointed conductors placed in the field. Under favourable conditions, the glow discharge from mountain peaks or masts of ships, exposed to the intense fields of a thundercloud, may become very conspicuous (St. Elmo's fire). Point discharge currents play an important rôle in the interchange of electricity between the atmosphere and the earth.

#### Electrification of Air and Rain

Air conducts electricity because of the presence of small carriers of positive and negative electricity called ions; and in fine weather positive electricity flows from the higher electrical levels down to the ground. When the potential gradient is negative the downward flowing current is also negative.

Raindrops are usually electrified, sometimes negatively and sometimes positively. The principal cause of the electrification of rain is probably the breaking up of large drops into smaller ones by powerful upward currents of air, the drops and the air receiving opposite kinds of charge. This theory has been put forward to account for the origin and distribution of electrical charges in thunderclouds. Recent experimental work supports the belief that thunderstorms conduct positive electricity into upper conducting levels (ionosphere) which would act to transfer it from one part of the world to another and so maintain the normal electric field.

A. J. Drummond

#### Electricity Commissioners.

Panel of experts appointed by the minister of Transport, 1919. Their duties were to promote, regulate, and supervise electricity supply (i.e. to coordinate the industry to ensure plentiful and cheap electricity); issue regulations for the

safety of the public; approve types of electricity meters, and test and examine them. They had no direct governmental authority, but could advise the government on the proper course to be taken in all questions relating to electricity. The cost of the commission was borne by the industry, and not by the taxpayer. The commission came under the ministry of Fuel and Power, 1942, and was abolished by the Nationalization Act, 1947.

**Electricity Supply.** Although isolated installations were in operation a decade earlier, public electricity supply may be said to date from about 1881, when the incandescent lamp became a commercial proposition. Legislation of the period placed the new industry in the hands of private enterprise, while allowing for future (compulsory) purchase by municipal authorities where this appeared desirable. A number of companies were so taken over, but, under the control of the Board of Trade, both types of undertaking—municipal and company—developed independently. In 1919

the Electricity Commissioners were created as an authority charged with the promotion, regulation, and supervision of electricity supply, and were responsible to the ministry of Transport (from 1942 to the ministry of Fuel and Power).

The position early in 1947 was that, although wholesale distribution was in the hands of the Central Electricity Board (see *Electric Power*; *Grid*), created by an Act in 1926, retail distribution was carried out by 370 municipal authorities and 190 supply companies, each having its own area and its own system of tariff charges. Often different voltages were worked, although much had been done towards standardisation of both voltages and tariffs. By an Act of 1947, control of the entire structure of the industry—generation and both wholesale and retail distribution—was vested in the minister of Fuel and Power, via an electricity authority, operating through 14 area electricity boards, both the C.E.B. and the commissioners being abolished.

## ELECTRIC POWER AND ITS USES

E. B. Watton, A.M.I.E.E., Asst. Editor, *Electrical Industries*

*This article outlines the general principles of the generation, transmission, distribution, and use of electric power. For basic electrical principles see Electricity; Electro-magnetic Machines. See also Coal · Fuel; Lighting; Locomotive; Motor, etc.*

It is not an exaggeration to say that without electricity the civilized world as we know it could not exist. The machine age depends for its very life-blood on cheap power, easily available, and there is no form of power more easily distributed and utilised than electricity.

At one time, if a man wished to start a factory, he had to build it near a coal producing region to obtain reasonable economy. He had to instal a steam engine, with its attendant boilers, condensers, chimneys, and special buildings: provide staff to operate it; transmit the power produced to remote parts of his factory by pulleys and belts or ropes, which took up valuable space, made the planning of factory lay-out difficult, and wasted, in themselves, a considerable amount of the power generated. If he started in a modest way he had either to use an engine much too big or be faced with the prospect of scrapping his engine and installing a new one when business expanded.

In the present age, he builds his factory wherever electric power is available—which means virtually anywhere. Each machine

he instals has its own built-in motor, just large enough for its actual requirements, with no power wasted. When the machine is stopped, there is no fuel wasted by keeping up fires in boilers. The chief advantage is, of course, the facility with which electric power can be generated economically on a large scale, in power stations, transmitted over long distances, and easily reconverted into most other forms of power required.

**GENERATION.** A little water power is used in Great Britain (notably in Scotland) and to a much larger extent abroad; particularly in the U.S.A., where colossal power schemes exist, such as Niagara Falls, Boulder Dam, and in the Tennessee Valley. (See *Hydro-electric Installations*.) In the U.K., however, the main source of supply is from coal, the energy of which is converted into electrical energy by the steam turbine. Where, for any reason, coal is not available, oil, or another fuel can be used instead.

In selecting the site for a power station, there are three main considerations: (1) Distance from load. Though electricity can be transmitted over any distance,

1. Battersea power station on R Thames after completion of "B" section, 1941; total output 343,000 kW.  
2. Turbo-generators (100,000 kW.) at Battersea "B."  
3. Grid sub-station, Brighton, showing pylons and switching gear. 4. Hams Hall, Birmingham, 300,000 kW.,

with cooling towers. 5. National and area control room of central British electricity authority, London. 6. Rural 11,000 v. transmission line with pole-mounted transformer and cut-out switch. 7. Thames-side station, Barking, 300,000 kW. (ultimate capacity 500,000 kW.)

# **ELECTRIC POWER: GENERATION AND TRANSMISSION TO HOMES AND INDUSTRY**

*Photos. Electrical Review; British Thomson-Houston, Ltd.; Associated Press; Topical*

there are limitations on economic grounds (*v.i.*, under Transmission).

(2) Availability of fuel. Power stations must be sited where the supply of coal or other fuel is easy by rail or water—preferably the latter; for a station may use upwards of 2,000 tons of coal per day. (3) Availability of water. The steam turbine, to be efficient, must run “condensing,” *i.e.* the exhaust steam must be reconverted into water in a condenser, which requires a large supply of cooling water. A convenient method is to build the station on the banks of a river, where a system of large culverts, fitted with screens or strainers, can take several million gallons per hour from the river and return it, after use, by another system of culverts to a point farther downstream. If this is not possible, and there is no river near, the hot water from the condensers must be dealt with by cooling towers, in which the water is discharged in a fine spray from a point high up in the tower, dropping like rain into a pond below, being cooled in its journey by the rising air currents created by the chimney-like structure.

The boilers used are invariably of the water-tube type, in which the water is contained in banks of tubes arranged so as to be surrounded by the hot gases from the furnace. A modern boiler may work with steam pressures of the order of 1,000 lb. per sq. in.

The hot gases, having done their work, are led away to the chimneys by dust and grit catchers, which remove particles likely to cause pollution to the atmosphere.

#### From Steam into Electrical Energy

The steam turbo-alternators which convert the energy of the steam into electrical energy have grown during the last three decades to ten times their former size, and 60,000 kilowatts in a single unit is common. They run usually at a speed of 3,000 r.p.m. and generate alternating current at a frequency of 50 cycles per second. A common voltage is 11,000, but direct generation at 33,000 volts is steadily on the increase. Alternating current is invariably used owing to the facility with which it can be generated at high voltage and changed from one voltage to another by transformers (*q.v.*). The electricity generated is fed, through switchgear provided with the most delicate protective devices to guard against faults in

any part of the apparatus, into transformers which step up the voltage to an appropriate value for transmission to the load or distribution centre.

**TRANSMISSION.** To comprehend the economics of electric power transmission, it is necessary to have some understanding of the difference between current and voltage. Consider an electrical conductor as a pipe through which water flows. The electrical voltage is analogous to the pressure of the water, the rate of flow of the water is comparable with the current measured in amperes, and the area of the pipe may be considered to correspond to the electrical resistance of the conductor. Some friction in the pipe will cause a loss of power, which will be dependent on the rate of flow; but, if the pressure be kept high and the rate of flow low, the loss will be small in proportion to the total power transmitted, which is dependent upon pressure and rate of flow.

#### Increase in Transmission Voltages

This holds good with electricity: the higher the pressure, and the lower the current, the lower will be the percentage losses for a given conductor size. For a given amount of loss, the conductor may be made smaller, so saving in actual conductor material. On the other hand, the cost of switchgear and other apparatus increases with the voltage, although not in direct proportion. For long distances, the highest voltages commercially possible should be used. Transmission voltages have risen in a most spectacular manner from the 1,100 volts of the early A.C. stations, to 11,000, 33,000, 66,000, 132,000, and even higher. The Boulder Dam scheme operates at 220,000 volts. It is believed that 500,000 volts may represent nearly the maximum, owing to corona—a bluish flame-like discharge which forms around high-voltage conductors, causing electricity literally to leak off into the ionised air (*see Electric Discharge*).

**THE GRID.** The British grid is one of the finest examples in the world of a carefully planned and closely knit transmission system, linking more than 120 major power stations with some 4,000 miles of transmission lines serving nearly 300 transformer and switching stations, and rendering power available throughout a network that almost covers the country. The advantages of such a system can hardly be over-estimated. With interconnexion, as opposed

to separate small power systems the amount of spare plant held in each station to cover breakdowns or repair periods can be cut down to a fraction of the former requirements; and, except when the entire output of existing generators is below total needs, a complete breakdown at one power station would not interrupt the supply to consumers. Costs can be reduced by transferring the load from inefficient stations and running the others at their maximum efficiency. Centralised control is possible of plant aggregating some 10,000,000 kilowatts.

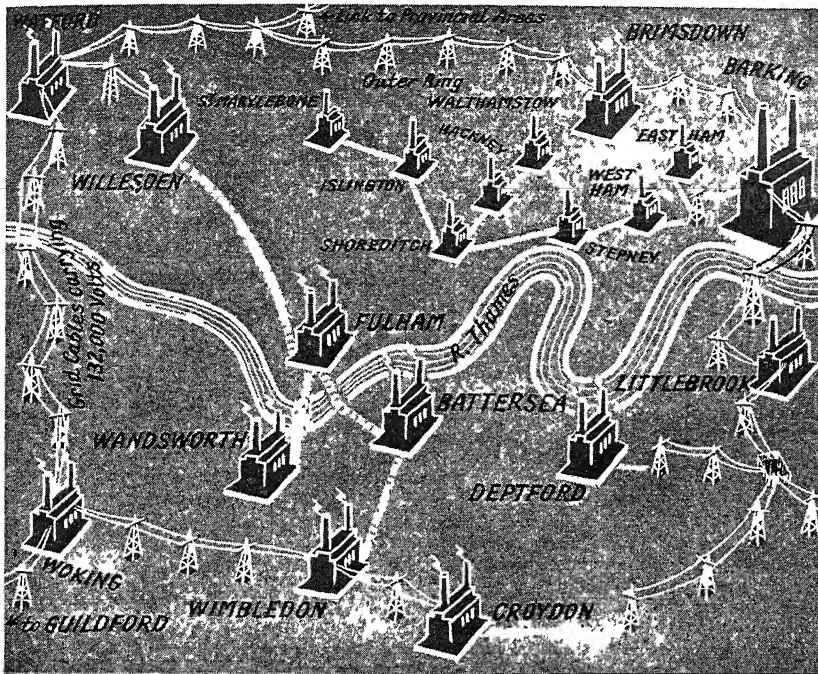

Grid transmission is mostly by overhead conductors on steel towers. In certain congested areas (London cable grid) a considerable amount of power is transmitted by underground cables, but the cost of installation and upkeep of underground cables is very high.

**DISTRIBUTION.** The electricity, as it arrives at the receiving end of the transmission system, is still at high voltage (132,000 or 66,000 with the grid), which is quite unsuitable for any ordinary purposes and must be “stepped down” before being distributed to consumers. The actual details of this depend on the type of district and the type of consumer.

#### Transformers for Reducing Voltage

A grid receiving station contains transformers which step down from 132,000 to 33,000 volts, and distribute to large sub-stations where the electricity is again stepped down to 11,000, 6,600, or 3,300 volts and further distributed to smaller sub-stations. In a town, underground cables operating at 11,000 volts terminate at small brick sub-stations or steel kiosks, containing further transformers to step down to the 240 volts which is the standard distribution voltage for domestic consumers. These small sub-stations are placed at various load centres of the town, and from each radiate the 240-volt feeder cables to strategic points where, in small steel pillars or underground boxes, they are interconnected by fuses to the network of distributor cables running along the streets under the pavements.

From these, at appropriate intervals, is tapped off the service cable entering each house, and terminating in a main switch and supply meter. Factories and other large consumers might be supplied direct at 3,300–11,000 volts, the necessary transformers being located on the premises.

**Electric Power.** Diagram of the London area, explaining how the British grid system links up points of electric current supply. In congested areas power is transmitted by underground cables (shown here by dotted lines), but in the open country overhead cables, on steel towers, are used. The benefits of this system are fully explained in the text.

The photo-electric cell or "electric eye," besides being the basis of the talking film, finds considerable use in industry because of its extreme sensitivity to light and colour and its ability to "watch" without tiring, at high speeds, a whole host of operations. It is used in counting thousands of articles; in complicated colour-matching problems (eliminating human error); in supervision; ensuring that an operator's hands are clear of the danger area in machine presses; giving the alarm at the signs of undue smoke; controlling the position of the printed design on a paper bag, etc.

#### AGRICULTURE.

On the farm, besides

In rural areas, the 11,000-volt supply may be taken by overhead line to a village or other point of supply, and stepped down to 240 volts by a transformer mounted directly on an overhead pole structure, feeding low-voltage overhead feeders slung from wooden poles, from which service connexions are taken directly to the eaves of houses.

**ELECTRIC LIGHTING.** An important use of electricity is in its original application—illumination—where its advantages are so overwhelming that no other source can hope to compete. Its independence of air supply and absence of combustion gases permit its use where any other form of illumination would be impossible; its ease of application makes practicable illumination values undreamed of by any other method; its beauty and convenience cannot be equalled. From the automatic illumination of the inside of a cupboard to the shadowless flood of light on arterial roads, from the tremendous intensity of a searchlight beam to the soft decorative lighting of a restaurant, it is without equal.

**INDUSTRY.** Wherever power is required for a machine, from a watchmaker's lathe or a sewing

machine to the largest steel rolling mill, electric motors will do the work more conveniently than any other form of power. In heavy industry electricity permits the speeding-up of processes not only by its actual rapidity of action, but by its ease of control. A rolling mill with several hundred motors varying from 1 to 5,000 h.p. can have its control centralised in a cabin overlooking the mill and operated by one man. The same power spins thread for artificial silk stockings. Metal is melted in electric furnaces; electric cranes, conveyors, and trucks provide safe and rapid transport; electromagnets remove unwanted iron particles; ingenious testing devices detect cracks or flaws without destruction of materials; special lamps provide infra-red rays to hasten paint-drying processes.

#### Electric Welding

Electric welding (*q.v.*) has revolutionised a great many industrial processes. Castings, particularly heavy ones, have been largely replaced by fabricated structures built up from steel plates and sections by arc welding, saving weight and cost. Spot, or resistance, welding is used in sheet metal work to replace rivets.

running the chaff cutter, mangold slicer, cattle-cake breaker, cream separator, and all the other farm machinery, electricity is used to milk cows, shear sheep, dry grain, pump water, heat soil, and hatch chickens.

**TRANSPORT.** The tram and its younger relation, the trolley-bus, move tremendous numbers of people cheaply and speedily, without polluting crowded streets with poisonous fumes, and without using imported petrol. The electric battery vehicle delivers milk, bread, laundry, etc., and collects refuse. The absence of smoke from electric traction makes it possible to locate railways deep under crowded cities; and the speed of acceleration and braking, the facility with which safety devices can be applied, make it possible to run many more electric than steam trains over a given set of rails. The escalator will move people at least as fast as they can walk, thus eliminating congestion. The electric lift, with its speed, smooth acceleration, automatic control, and multiplicity of safety devices, makes it practicable to live 90 floors above street level. In New York more people are carried in lifts daily than by any other form of transport.

**DOMESTIC.** Though the domestic load is by no means the largest item in the total consumption of electricity it is by far the most widely spread, as electricity is used at least for lighting wherever it is available. Its domestic use for other purposes is rapidly increasing, and includes such applications as space heating, water heating, cooking, washing machines, vacuum cleaners, irons, kettles, toasters, coffee percolators, artificial sun-lamps, radio and television sets, shavers, and clocks.

**Electric Shock.** Term used for the effect on a human being of the passage of an electric current through the body. The passage of an electric current through the human body depends upon the resistance encountered and the voltage applied. Up to 20 milliamperes is usually bearable by most people. From 20 to 50 milliamperes can be dangerous and harmful; above this figure death can be caused. If the current exceeds half an ampere, burning of the tissues may follow. A damp skin increases susceptibility to electric shock, so that persons bathing or washing are more likely to suffer should they touch a live conductor.

Shocks from electricity supply mains and traction systems are frequently dangerous. Above pressures of 100 volts, death may be caused. Alternating current is more lethal than direct current, especially at low frequencies. A shock from public electricity mains is usually more serious because the distribution system has one of its conductors connected to earth. If a person comes into contact with the conductor which is not connected to earth, the current may pass through his whole body, as the victim is usually standing on earth or upon some conducting medium in contact with it which is usually damp enough to conduct electricity. A dry wooden floor, however, is relatively safe.

#### Treatment for Shock

It is generally assumed that death from electric shock is caused by damage to the heart. A shock received through any part of the body which will cause the current to pass through the heart may be fatal. Shocks between the two hands or hands and feet are more dangerous than between the fingers of one hand or from the toe to the heel of one foot.

If the person is unconscious or cannot relax 'his hold of the live

conductor he should be pulled away from it or isolated by switching off the current or short-circuiting the conductors. When grasping the body, bare or wet hands must not be used. Insulate them with dry clothing or thick paper or other non-conducting material. A wooden stick or piece of dry timber can be used to push or pull the body away from the live conductor. Apply artificial respiration immediately as for cases of drowning; continue even if life seems extinct, at least until medical help can be obtained. Keep the patient warm and wrap up well with hot water bottles or some form of heat at the feet and near the heart. Do not give stimulants except under doctor's orders. Treat burns in the usual way, excluding air from the affected parts.

**Electric Steel.** Steel refined in an electric furnace, irrespective of the type of furnace employed or of the refining methods adopted. In refining by electrical methods the principles are essentially the same as those in the open-hearth process, though the practice may be different. Since electricity is costly, the melting of scrap in the electric furnace or the preliminary refining by this means is less economical, so that the furnace is often used only for the final stages of steel production, the procedure then being known as duplexing or triplexing, according to the number of stages in production. Electric steel can be made in either the arc furnace or the induction furnace. The former may be lined with either acid or basic refractories, depending on the degree of refining required and the type of steel to be made.

Basic electric arc furnaces are used for the manufacture of carbon tool steels, alloy structural steels, heat- and corrosion-resisting steels, and tungsten high speed steels, while acid linings are chiefly used when no refining is to be undertaken, as in steel foundries making steel castings. Both acid and basic linings are used for the manufacture of austenitic chrome-nickel steels. For high manganese steels the basic lining is invariably used. For certain other special steels the high frequency induction furnace is preferred to the arc furnace. Induction furnaces overcome any possible tendency to local overheating of the molten metal, as well as providing steel of more uniform composition.

**Electric Traction.** Method of locomotion. Its history dates back more than 100 years. In 1839 a crude electric locomotive, powered by primary batteries, was run on the Edinburgh-Glasgow rly.; but this was not a commercial or technical success, and little is known about it. In 1883 Magnus Volk opened a line half a mile long, raised above Brighton beach; and the same year about 7 m. of track from Giant's Causeway to Portrush was operated electrically. The first electric rly. in the U.K. was the City and South London tube, opened 1890. Locomotives were of 100 h.p. rating, and the maximum speed of trams was about 25 m.p.h. By 1900 this line, the Central London tube rly., and the Liverpool overhead rly. were still the only electric rlys. (as distinct from tramways) in the country, which possessed 1,400-1,500 route miles in 1947.

#### Advantages of Electricity for Railways

The chief advantages of electric traction for railways are: (1) Improved acceleration and braking, combined with automatic signalling, enable a much denser service to be run in safety, particularly where frequent stops are necessary. The steam train, taking so much longer to get up speed, could not possibly handle the suburban transport of London. (2) There is no smoke or fumes; apart from the aesthetic and hygienic aspects, this eliminates a serious disadvantage of coal-steam traction in underground tunnels. (3) There is economy of fuel; power stations burn low grade fuel under conditions of maximum efficiency, while locomotives burn high grade steam coal under conditions of relative inefficiency. Fuel transport, distribution, and stocking are much simplified. In countries where hydro-electric power is available, and good steam coal is not (such as Italy and Switzerland), electric traction is particularly important in the national economy. (4) In hilly country, gradients can be more severe and speeds higher, owing to the relatively large amounts of power available for ascents, and the possibility on descents of using regenerative braking (i.e. loading the train motors as dynamos, and returning power to the system), which prevents waste of energy, wear of brake blocks, and overheating of wheels. (5) Although the first cost of an electric locomotive is usually higher than that of a steam one,

# **ELECTRIC TRACTION: COLLECTOR AND CONTROL EQUIPMENT APPLIED TO TRANSPORT**

Photos, British Thomson-Houston, Ltd ; Mickleover Transport, Ltd ; Swiss Federal Railways, British Railways, Fox

the maintenance costs are usually lower. The chief objection to electrification of main rlys. in England is the high first cost. When good steam coal was plentiful and cheap there was little incentive towards the electrification of main lines.

A train may consist of a number of ordinary coaches hauled by an electric locomotive. This is used for main line traffic, where different types of trains are needed. For suburban, tube, and other lines, where traffic is dense and stops are frequent, the multiple unit system of trains with trailer coaches and motor coaches is better. Each coach with motors and controls and collector gear is a complete driving unit in itself, but all are interconnected, so that they operate simultaneously from the driver's compartment in the front coach.

Acceleration is governed by, amongst other things, adhesive weight, i.e. the weight on the driving wheels. If the tractive effort is too great for the friction between wheels and rails, the wheels will slip. (*See Locomotive.*) In the multiple unit system, a far greater proportion of the total weight of the train is utilised as adhesive weight, thus improving the acceleration obtainable.

#### Methods of Current Supply

Current supply to electric rlys., as to tramways, has followed two main methods—from overhead conductor wires, and from surface or buried conductor rails. For the overhead system, in one method a collector bow arranged something like a "lazy-tongs" has contactors which engage with the naked conductor cables; the current is thence taken to the controller and motors. In trams and trolley-buses, trolleys attached by a springy boom to the roof of the vehicle run along the cable and transmit current to the motors. In many old urban tramway systems the conductor is fixed in a conduit arranged between the running rails and well beneath the ground. The tram carries a sliding contactor which passes along a slot in the top of the conduit at ground level. In all these devices the contacting mechanism and conductors are appropriately insulated. Railways may use a single conductor rail which is also laid alongside the running rails on insulators: then there is an earthed return through one of the running rails; or there may be two independent conductor rails alongside the running rails.

**TRAMWAYS.** In Great Britain a dividing line has always been drawn between tramways and rlys. In other countries this is not always so, systems being frequently operated partly as tramways and partly as light rlys. Electric tramways date from about 1884, the first line in England being opened experimentally at Leeds in 1891. They grew in popularity between 1900 and 1910, and in 1925 reached a peak, over 14,000 trams then running in Great Britain. They began to be replaced by trolley-buses, until there were in 1947 fewer than 8,000 trams, while route mileage of trams declined from the peak of 2,700 m. in 1920 to about 1,000 m., part having been replaced by motor buses and part by trolley-buses. One cause of the decline of tramways is the expense involved in track relaying, which is in most districts necessary every 5 to 10 years.

**TROLLEY-BUSES.** The chief advantages possessed by the trolley-bus over the tram are as follows: (a) Mobility and flexibility; a trolley-bus is not forced to disgorge its passengers in the middle of the road and cause traffic congestion, neither does one disabled vehicle block the entire system until it can be removed. (b) The major expense—track—does not arise. (c) Speeds are higher. (d) Passengers enjoy more comfort and silence, on account of the pneumatic tires. On the other hand, the trolley-bus is costlier in upkeep; and it carries fewer passengers.

**DIESEL-ELECTRIC LOCOMOTIVES.** The motive power of these is a Diesel type internal-combustion engine driving a dynamo which feeds the driving motors. This is a complicated arrangement, and its first cost is high, but it is the only practicable method of utilising the Diesel high-power traction, since no internal-combustion engine will produce a heavy torque at low speeds; and change-speed gear-boxes as used in motor vehicles are impracticable for such heavy service. Advantages over the steam locomotive are the complete absence of stand-by losses and instant availability—there are no fires to be lighted and kept banked when not in use. The chief use in Great Britain is for intermittent work such as shunting, but in countries where fuel oil is cheaper than coal the Diesel-electric locomotive would appear to have advantages and is in increasing use.

**STORAGE BATTERY TRACTION.** Locomotives fitted with accumu-

lators have a limited application for underground haulage in mines, and for service over electrified lines during shut-down periods: for construction or track repairs at night, and for breakdown work. Regular train services are hauled by storage battery locomotives on certain railway lines in Eire where a special Drumm battery is used. This battery, which has exceedingly high charging rates, can be partly recharged during a halt at stations, the power being obtained from the Irish grid. With this exception, storage battery traction on rlys. has made no great headway.

**BATTERY-PROPELLED ROAD VEHICLES.** These are ideally suited to urban delivery service where short hauls and frequent stops are the rule. They have low operating costs, being normally recharged at night when electricity rates are usually cheaper than by day. The average run per charge is 45–50 miles. Above this range they cannot be considered as present a serious rival to the petrol vehicle. Small battery-propelled trucks transport luggage at rly. stations and convey materials in factories; they often haul a train of trolleys. Their silence and absence of poisonous exhaust fumes are important in enclosed premises. Recent developments have produced various types of electrically propelled prams for delivery of milk, etc. These have no driver's accommodation, being designed merely to operate at walking pace and relieve the delivery man of the manual effort of pushing a heavy weight.

**Electric Wave.** This is a loose and unscientific term for electro-magnetic wave (*q.v.*).

**Electric Welding.** The joining of metals by welding in which the necessary heat is generated electrically. Three main processes in use are shielded metal arc welding; spot welding; and flash butt welding. In the first, heat is generated by an electric arc struck between the place at which the weld is to be deposited and the end of the rod or wire from which the metal required to fill the joint is to be melted. The joint is made progressively with layers of weld metal. A coating of flux surrounds the filler wire and melts in step with it to assist the fusion of the molten filler metal with the molten parent metal. There are several variations of the arc process, such as carbon arc welding, in which the arc is struck between the work and a carbon electrode whilst a

separate filler rod is melted in as required. Flux is applied to the joint faces, separately, before welding. Argon arc welding (applied widely to magnesium alloys) is a similar process which uses an arc struck between a tungsten electrode and the metal which is to be welded, whilst a stream of inert argon gas is maintained round the arc to protect the hot and molten metal from atmospheric attack, thus doing away with the need for a flux. A separate filler rod can be melted in as required.

#### Spot and Flash Butt Welding

Spot welding makes use of the relatively high electrical resistance between the contacting faces of two overlapping sheets of metal held in intimate contact. Electric current is passed through the sheets from one outer face to the other, at a localised area, and the heat generated at the interface (assisted by externally applied pressure) causes fusion of the sheets within that area. The pressure and the localising of current are effected by nipping the sheets between two small circular tipped electrodes, usually made of a copper alloy and passing current between them. Variations are found in the projection, seam, and butt welding processes.

Flash butt welding, which differs from butt welding, makes use of the high electrical resistance between relatively rough contacting faces. If two metal parts with identical cross-sectional shapes are held in contact whilst an electric current is passed from one to the other, heat is generated at the many points of local contact, causing the metal there to burn and explode. Some heat from this burning is transferred back into the bodies of the parts before the exploding metal bursts out from between the faces in showers of sparks. The gap left by the explosion is closed by the machine and the process is repeated until sufficient heat is transferred to the parts to allow them to be welded together under a suddenly applied thrust. See Welding.

**Electrochemical Equivalent.** When a quantity of electricity is passed through an electrolyte it sets free ions (*q.v.*) of the elements present. The weights of the individual ions liberated by any given quantity of electricity are proportional to their chemical equivalents. In order to correlate the available information, the electrochemical equivalent has been defined as the weight in grams of

an ion liberated from an electrolyte by one coulomb of electricity. Faraday's laws show this is proportional to its chemical equivalent. See Coulomb.

**Electrochemical Series.** A list of the metallic elements in the order of magnitude of their single electrode potentials (*q.v.*). The common metals run from gold, the most noble, through platinum, silver, mercury, copper, hydrogen, lead, tin, nickel, iron, zinc, manganese, aluminium, magnesium, and calcium to sodium. A metal such as zinc, later than hydrogen in the series, will liberate it from acids. A metal late in the series will displace an earlier one from a solution of its salts; *e.g.* copper is deposited by aluminium or iron. In general the corrosion resistance of a base metal is lower than that of a noble metal. This is not true of a few metals like aluminium, which form a protective skin of oxide. Two metals in contact and in an electrolyte, sea-water for example, will influence the corrosion of each other according to their relative positions in the series. Engineers and metallurgists must therefore consider these factors in their designs.

**Electrocution.** Death from an electric shock. This is a hybrid word formed in an attempt to combine execution and electricity. It was first used in America and originally referred to the administration of an electric shock to carry out the capital sentence on a condemned criminal; but the term electrocution is now used to describe any death resulting from an electric shock. Electrocution is, for example, a humane method of destroying dogs.

Electrocution of criminals was first adopted by the state of New York, where a law making it obligatory was passed on June 4, 1888. The first criminal so executed was William Kimmber, at Auburn prison, Aug. 6, 1890. Electrocution for capital offences has now been adopted by 26 states of the Union.

The apparatus for carrying out the sentence of electrocution consists of an alternating dynamo, capable of generating current at a maximum pressure of 2,000 volts, connected to a chair fitted with binding straps and adjustable head and leg electrodes. When the criminal has been seated in the chair, his head, chest, arms, and legs are secured with the straps; one electrode, is affixed to the head, and a second to the calf of the leg. The full pressure of

2,000 volts is applied for four secs., reduced to 500 volts for one min., and again raised to full pressure for four secs. A final contact is then made to abolish reflexes in the dead body. The criminal is dead within two mins. of entering the execution chamber. Electrocution is believed to be painless and instantaneous; but scientific opinion is divided on that point, though there is little doubt that circulation and respiration cease with the first electrical contact. See Capital Punishment.

**Electrode.** Term applied to the terminals of a voltmeter, the vessel containing the liquid in electrolysis. Faraday distinguished the one by which the current enters the cell as the anode, and the one by which it leaves as the cathode. In an electro-plating bath, the articles being plated constitute one of the electrodes of the bath. The term is also applied to the two carbons of an electric arc lamp and the terminals of an electric furnace, where one may be a rod of carbon, and the other the metal container of the furnace cell. The filament, plate, and grids of a thermionic valve are also known as electrodes.

**Electro-deposition.** This subject is considered under three heads: Electro-plating or electro-gilding, in which one metal is permanently deposited on another; Electro-typing, in which a metal is deposited on a surface from which it is afterwards removed; and Electro-metallurgy, in which metals are refined by causing a pure element to be deposited on a metallic surface while foreign elements are rejected in an electrolytic bath. The physical action on which all these processes depend is described under Electrolysis.

**Electrode Potential.** If two metals are placed in a solution so that they will form a cell, a certain electrical voltage will be produced; this cell voltage is the algebraic difference of two single voltages, corresponding to the two metallic electrodes. Considering the half-cell of one metal in a solution, containing 1 gram-molecule of its ions per litre, the single voltage is known as the electrode potential. The normal electrode potential of hydrogen is taken as zero and the values for metals are expressed in a scale based on hydrogen, ranging from negative for the base metals to positive for the noble metals. See Electrochemical Series.

**Electrodynamics** or **ELECTROKINETICS.** Science which deals, in contrast with electrostatics (*q.v.*),

with the motion of electricity, *i.e.* with current electricity. Ampère's work in 1820 laid the fundamental laws governing the subject. See Electricity.

**Electrolysis.** Decomposition of liquids by electric current. The liquid which undergoes such action is called an electrolyte (*v.i.*). Water may be entirely decomposed into its two elements, oxygen and hydrogen, the gases being liberated at opposite sides or ends of the apparatus—a cell—in which the operation is carried out. With solutions, *e.g.* sulphate of copper in acidulated water, the decomposition may be only partial, while under suitable conditions, though decomposition goes on, the state of saturation of the solution will be maintained.

Electrolysis. Fig. 1. Diagrammatic view of cell for decomposition of liquids by electric current. See text

The elements necessary for the exhibition of this phenomenon are shown in the accompanying diagram (Fig. 1): A is the container, which must either be of a material which is non-conducting electrically or be insulated so that the current of electricity will not pass through it; while B, B' are two conductors immersed in the liquid, each being provided with an arrangement by which it may be connected to a source of electricity. The combination constitutes a cell. The current enters the cell at B, which thus becomes the positive pole or anode of the element, and, after traversing the bath, escapes at B', which is thus the negative pole or cathode, these poles being distinguished by + and — symbols.

If the conductors be two strips of platinum and the liquid water, then, when the current passes, oxygen is liberated at the surface of the anode and hydrogen at the surface of the cathode. The two gases may be easily collected by an arrangement indicated in Fig. 2, which represents the original voltameter. A and B are inverted glass test tubes, each having introduced into it at the bottom one of the electrodes. The tubes are first filled with the electrolyte—the water, which is usually slightly acidulated to facilitate the action

—and when the current passes, the gases which are released at the surfaces of the electrodes rise to the top of the tubes and displace the liquid. Two notable points are to be observed here: the gases collect separately, and no action whatever is apparent in the body of the bath between the two tubes. But when oxygen in the one tube is set free, hydrogen must be liberated at the same instant; the latter does not, however, collect side by side with the oxygen in the tube where it is separated, but by some invisible action passes out of that tube across the bath and appears in the other tube. Similarly, there must be a migration of the oxygen from the hydrogen collecting tube back to the oxygen tube. Thus one of the elements separated travels with the electric current and the other against it; to the former Faraday gave the name *cation*, meaning that which goes down, and to the latter the term *anion*, or that which goes up. The theory is advanced, and reference should be made to a textbook on physics.

The phenomenon of electrolysis is not only profoundly interesting scientifically; it has received industrial applications of the first importance. Electro-metallurgy depends largely upon it; electroplating wholly. The phenomenon may not, however, be always beneficial. In industrial practice the electric current is generated and caused to flow through the cells by means of a dynamo; but a current may be induced in the cell itself, as in the ordinary voltaic or galvanic batteries, by the employment of two dissimilar metals immersed in a suitable electrolyte. A current may even be set up between two metals of the same kind, provided there be a slight difference in their molecular or chemical structure. Such a current may be sufficient to set up electrolysis if other conditions are favourable. Hence machinery or metal structures immersed in water, or in solutions, may present the conditions necessary to set up electrolytic action and decomposition. For the uses of Electrolysis in medicine, and the conditions treated with it, see Electrotherapeutics; see also Electro-Metallurgy; Voltameter.

**Electrolyte.** Conducting solution which will dissociate into particles, or ions, on the passage of an electric current. The solution may be composed of a salt dissolved in water or fused, either by itself or with other salts or acids. The positively charged particles, cations, will proceed to the negative electrode or cathode, while the anions go to the anode. Thus, if a current be passed through a dilute solution of common salt, NaCl, the sodium cations, Na<sup>+</sup>, will go to the cathode and the chlorine anions, Cl<sup>-</sup>, to the anode. Once they reach their respective electrodes, the ions lose their charges and re-form atoms, which may be liberated as a gas, deposited as a solid, or react with the solution. In the example, chlorine gas is liberated at the anode, but the sodium reacts with water to form caustic soda at the cathode. But if, instead of being dissolved in water, the salt were to be fused, electrolysis of the melt would give pure sodium and chlorine. Pure water will not readily conduct electricity, but the addition of very small amounts of molecular compounds which will ionise, such as acids or salts, renders it an excellent electrolyte, as it splits up into its component atoms of hydrogen and oxygen. See Electrolysis; Ion.

**Electrolytic Polishing.** Process for imparting a bright lustre to metal objects instead of the duller surface resulting from electroplating. It consists of reversing the current flow through the electrolyte, so that the object treated forms the anode instead of the cathode. A minute amount of the

Electrolysis. Fig. 2. A and B are inverted test tubes collecting the oxygen and hydrogen set free from water by electrolytic action

metal surface is removed by the treatment, leaving a bright, smooth finish. Silver plated objects, for example, need no subsequent buffing; objects of complex shape, which it would be impossible to polish by mechanical methods, are turned out with a lustrous surface direct from the bath. The electrolyte is an acid solution which varies with the metal to be "electro-polished."

**Electro-Magnetic Machine.** Term covering virtually every type of electrical machine met with outside a laboratory. At one time, electricity and magnetism were thought to be totally different

phenomena, but in 1820 the famous Oersted experiment proved them to be inter-related. Oersted (*q.v.*) found that a wire carrying an electric current would deflect a compass needle, thus proving that a field of magnetic force existed around the wire. In 1825 Sturgeon showed that a horse-shoe of soft iron, surrounded by a coil of wire, became magnetised when a current was passed

duced in that part of the disk which lies between the magnet poles at any given instant.

From this it is a simple step to an elementary generator consisting of a single conductor bent into a loop or single-turn coil, rotating between the poles of a magnet as shown in Fig. 2. Each end of the loop is connected to a collector or slip-ring with a brush making rubbing contact to connect the loop to an external circuit. At any given instant each half of the loop is cutting the field in opposite directions (Fig. 3), so that, as the conductor is doubled back on itself,

Electro-Magnetic Machine. Fig. 4. Development of the elementary machine: multi-turn coil revolving in concentrated field produced by pole-pieces and iron core

tation. If direct current is required, some device must be added to reverse the connexions between the coil and the external circuit at each revolution. A commutator in its simplest form is made by replacing the slip-rings by a single collector-ring or tube which is split lengthwise into two sections insulated from each other and from the shaft. One end of the loop or coil is connected to each half so that, as the coil revolves, the connexions to the brushes are automatically reversed in step with the alternations of the

Electro-Magnetic Machine. Fig. 5. Elements of commutation: connexions to brushes are being reversed before coil re-enters magnetic field

through the coil, thus producing the first electro-magnet.

It was left to Faraday to prove the converse of Oersted's conclusion—that a conductor in a changing magnetic field, *i.e.* a field which was either growing

stronger or dying down, had a current induced in it. He reasoned that a conductor which moved in a stationary magnetic field, cutting the lines of magnetic force, would also have a current induced in it. These improvements (Fig. 4) will bring the out-

electro-motive force. This produces a unidirectional current in the external circuit (Fig. 5). Such a machine may be regarded as the forerunner of the direct-current generator or dynamo (*q.v.*).

**REVERSIBLE ACTION.** Besides converting mechanical power into electrical energy, it is possible to reverse the action, so that electrical power supplied to a coil in a magnetic field is made to produce rotation, and hence mechanical energy. The action can be understood by reference to Fig. 6, where A represents a conductor carrying no current, lying in a magnetic field. When a current is passed through it, as at B, it becomes surrounded by its own magnetic field (represented by the circle). This, interacting with the field due to the magnet (N.S.), tends to bend its lines of force, which may be regarded as elastic and, in trying to straighten themselves, push

Electro-Magnetic Machine. Fig. 2. Elementary machine with single-turn coil or loop revolving between magnet poles. Note collector or slip rings

His apparatus, from which developed the electrical machine, consisted of a copper disk rotating between the poles of a permanent magnet (Fig. 1). Rubbing contacts on the rim of the disk and the axle collect the current in-

Electro-Magnetic Machine. Fig. 3. Diagram showing the two sides of a revolving loop cutting a magnetic field in opposite directions

put of the machine to the point where it has practical value.

As one coil-side only reaches a position midway between the poles, it ceases to cut the field and the electro-motive force drops to zero—to rise again in the opposite direction. The current flowing in the external circuit from the brushes is an alternating one, its frequency of reversal being proportional to the speed of ro-

Electro-Magnetic Machine. Fig. 6. Motor principles: A. Conductor carrying no current; B. Field produced around conductor distorting main field; C. Main field straightens out, forcing conductor to move out of field

the conductor out of the field. A machine with a commutator can produce continuous rotation, and thus function as an electric motor, the speed being governed by the strength of the magnetic field, by the current passing through the coil, and by the mechanical load applied. A machine without a commutator will also run as a motor when supplied with *alternating* current; but only at one speed, corresponding to the frequency of alternation of the supply—i.e. it is a *synchronous* machine.

**CLASSIFICATION OF MACHINES.** *Generators* convert mechanical into electrical energy; they fall into two main classes, the direct-current (D.C.) generator or dynamo, and the alternating-current (A.C.) generator or alternator (*q.v.*). *Motors* convert electrical into mechanical energy; they may also be divided into two main classes, D.C. and A.C.; while A.C. motors can be further subdivided into synchronous and asynchronous machines, the latter capable of delivering power at other speeds than that fixed by the frequency. (See Motor, Electric.) *Converters* are machines which change electrical energy of one type or pressure to electrical energy of another type or pressure. They fall into three groups: A.C.-D.C. (or vice-versa); A.C.-A.C.; and D.C.-D.C.

#### Current Conversion

Alternating to direct conversion is the principle in (a) *Motor-generators*, in which a straightforward A.C. motor is mechanically connected to a straightforward D.C. generator; (b) *Rotary converters*, consisting of a single machine built like a D.C. generator, but with the addition of slip-rings whereby A.C. is fed into the rotating conductors, to reappear as D.C. at the commutator. The machine can be regarded as a synchronous A.C. motor and a D.C. generator condensed into one machine, with all parts in common. (c) *Motor converters*, which consist of two machines, outwardly resembling a plain motor-generator, but more complicated in that the rotating conductors of the two machines are electrically as well as mechanically connected. The A.C. end functions half as a motor and half as a transformer, while the D.C. end functions half as a plain D.C. generator and half as a rotary converter.

A.C.-A.C. converters can be divided into *transformers* for changing from one voltage to

another, and *frequency changers*. The transformer, although a true electro-magnetic machine, has no moving parts, but works on the principle of Faraday's earliest induction experiments. Two coils are magnetically linked by an iron core. The primary coil is excited by an alternating voltage, and the changing magnetic field which it produces induces an alternating voltage of the same frequency in the secondary coil. This secondary voltage is proportional to the ratio of the number of turns in each coil, so stepping up or down is simple. Frequency changers are what their name implies, and may be regarded as motor-generators with two A.C. machines.

#### Stepping Direct Current

Direct current cannot be changed from one voltage to another without rotating machinery. Motor-generators can be used, with both machines arranged for D.C., and there are two special machines, the *rotary transformer* or *dynamotor* (*q.v.*) and the *metadyne* (*q.v.*) or *amplidyne*. The former may be regarded as a motor and a dynamo with two sets of rotating conductors and two commutators, revolving in a common magnetic field. It can convert D.C. from one voltage to another in a fixed ratio only, which is decided when the machine is built. The second class of D.C.-D.C. converter, developed in 1932, consists of a direct-current motor with a second set of brushes operating on a different part of the commutator. By varying the method of connexion, and by the addition of extra windings on the field-magnet system, it can be made to perform extraordinary duties, *e.g.* operating as a constant-current D.C. transformer of infinitely variable ratio; or acting as a power amplifier.

#### Electro-Magnetic Wave.

Wave consisting of an electric force and a magnetic force, set up in a dielectric in directions perpendicular to each other and both perpendicular to the direction of propagation. The existence of these waves was predicted by Clerk-Maxwell in 1855-64 and verified in 1887-88 by Hertz; and both initial theory and experimental confirmation were such brilliant investigations that their results were epoch-making.

The waves originally recognized by Clerk-Maxwell as electro-magnetic were those due to the sudden release of a charge on an insulated conductor, such as the sparking across of a sphere-gap.

Starting from the assumption that this sudden release of energy was of the same nature as a mechanical blow upon an elastic material, he argued that a similar series of vibrations would occur, and proceeded to calculate their velocity of propagation and other properties by means of the same relationships.

Now the velocity of propagation of a shock or sound in air, or an impulse through an elastic solid, is given by  $v = \sqrt{e/\rho}$ , where  $e$  is the elasticity (*i.e.* stress/strain), and  $\rho$  is the density of the material. The electrical equivalent for elasticity is

$$Q/er^2 \times 4\pi r^2/Q = 4\pi/\epsilon,$$

where  $\epsilon$  is the dielectric constant; for density,  $4\pi\mu$ , where  $\mu$  is the permeability of the medium. Substituting, this gives  $v = \sqrt{1/\epsilon\mu}$ , which works out at  $3 \times 10^{10}$  cm. per sec., or 186,000 miles per sec. Thus the velocity is identical with that of light, and the waves travel in the same medium. The conclusion is, therefore, that light waves are also electro-magnetic. Maxwell deduced further that every transparent substance must be an insulator, and that the dielectric constant (specific inductive capacity) of any dielectric would equal the square of its refractive index.

#### Hertz's Simple Apparatus

The apparatus devised by Hertz for generating and detecting the waves was quite simple; but his demonstration of their compliance with Maxwell's equations and predictions was so graphic as to be almost sensational. He used the discharge of a sphere-gap, charged by an induction coil, as his source. Such a discharge creates a low resistance path for itself by its initial spark, through which the opposite charges in the two spheres rush together, and then overshoot, reversing the polarity of the spheres and continuing the process until damped out by circuit losses; much as the levels of the liquid in the two arms of a U-tube will oscillate after their relative heights have been disturbed. The spheres were fixed to metal rods in line with each other, bearing metal plates at their outer ends, into which the oscillating charges surged. Waves due to the movement of the charges were radiated through space, and could be detected by means of a similar sphere-gap joined by a circular loop of wire. When the length of the wire is such that the period of oscillation is the same as in the generating circuit, small sparks pass across the

gap. Thus the principles of resonance and tuning of an oscillating circuit were illustrated.

Having devised means for creating and detecting the waves, Hertz proceeded to show their similarity to light waves by reflecting them from a metal plate, refracting them with a prism made of pitch, and polarising them with a metallic grid. Finally, he formed a standing wave by causing the original wave to interfere with its own reflection, and by measuring the distance between successive nodes located by his detector, he found the wave-length, and verified the velocity of propagation. He confirmed that the waves were identical with light in all but wave-length or frequency.

#### Electro-Magnetic Energy

Although the waves were generated by electrostatic means, it is not difficult to show that they contain electro-magnetic energy as well. Before the charged spheres begin to discharge, their energy is entirely electrostatic and equal to  $\frac{1}{2} CV^2$ , where  $C$  is the capacity and  $V$  the voltage. The spheres are, in fact, a charged condenser, with the insulating medium between them—here the air forming a dielectric in a state of strain. Immediately the discharge begins, however, a current flows between them, relieving the strain in the dielectric, but creating a magnetic field in the space round the conducting rods. At the instant when the voltage between the spheres is zero and is about to reverse, the dielectric strain has disappeared and the electrostatic energy has vanished; but the current is a maximum and therefore the electro-magnetic energy, equal to  $\frac{1}{2} LI^2$ , where  $L$  is the inductance and  $I$  the current, is also a maximum. The energy keeps changing from electrostatic to electro-magnetic and back again, until the oscillation is damped out through resistance, dielectric, and eddy-current losses. The wave-lengths were of the order of 100–1000 m/s.

Employing the values for the energy given above and assuming negligible resistance, the period of oscillation  $\tau$  is given by

$$\tau = 2\pi \sqrt{LC} \text{ sec.,}$$

and the frequency  $f$  in cycles per sec. by

$$f = 1/\tau = 1/2\pi \sqrt{LC}.$$

The wave-length  $\lambda$  is given by  $\lambda = 300/f$  metres

$$= 1885 \sqrt{LC} \text{ metres,}$$

where  $f$  is in megacycles per sec.,  $L$  in microhenries, and  $C$  in microfarads.

Visible light is produced at wave-lengths ranging from 0.4 microns (violet) to 0.7 microns (red). Atomic physics has revealed the mechanism whereby light rays (including infra-red and ultra-violet) are formed. Each element is characterised by a fixed number of electrons circling round the nucleus. These keep to definite orbits, each having a definite radial distance from the common centre.

But if a substance is heated, some of the electrons in its atoms are able to move at high frequency from their own orbits to the next farther from the centre and back again; and as electrons are negative charges of electricity, they give out electro-magnetic waves when they oscillate.

An electro-magnetic spectrum is given in the figure, showing the relative position of visible and invisible light, and below them radio waves belonging to the various bands, audio-frequency waves, with those of supersonic frequency between the last two; while above the light waves are X-rays, gamma rays, and cosmic rays.

with those of supersonic frequency between the last two; while above the light waves are X-rays, gamma rays, and cosmic rays.

**Electro-Magnetism.** Term used for the branch of science which deals with the connexion between electrical and magnetic phenomena. In 1820 Hans Christian Oersted (*q.v.*) discovered that a wire conveying an electric current is surrounded by a magnetic field, and that a freely moving magnetic needle sets itself along a tangent to a circle surrounding the wire. Oersted's discovery was followed by the researches of D. F. J. Arago and A. M. Ampère and others, but it was Faraday who showed how to obtain electricity from magnetism, and thus laid the foundations of the electrical industry. See Electro-Magnetic Machine.

**Electro-Metallurgy.** Term used to describe those processes in metallurgy in which electricity supplies the energy. The scope is vast, covering all fields of metallurgy: the extraction of metals from their ores, refining, fabrication, joining, etc. Few metal articles are produced without being subjected to at least one electro-metallurgical process at some stage. The action of the electric current may be purely electrolytic (*see* Electrolysis), or electricity be used merely to generate heat. In the electrolysis of fused salts, both effects are used. Some other subjects included in the broad classification are described under individual headings (*see* Electric Welding; Electro-plating). Electro-metallurgy was born soon after Volta's discovery of the galvanic cell. Davy demonstrated the electric arc in 1807; Faraday carried on the work; Elkington developed electrolytic processes in England; and, once the dynamo was introduced, the industry grew rapidly.

Apart from electro-plating, the electrolysis of salts in water solution is used in two ways in metallurgy: for the extraction of metals from their ores, and for the refining of metals. Fundamentally the processes are similar. In both the metal is deposited electrolytically from a solution of its salts on one electrode of a cell; but in refining the other electrode is composed of the impure metal and dissolves continually, keeping the metallic content of the bath virtually constant. The impurities either remain in the solution or form a sludge which can be removed periodically. Copper was the first metal to be refined electrolytically by Elkington and is still the most widely treated.

#### The Refining of Metals

Impure "blister" copper contains not only undesirable impurities, such as nickel, arsenic, selenium, tellurium, and antimony, but also varying amounts of gold, silver, and platinum. These are recovered by electrolytic refining and their value often repays the cost of the whole process. The crude copper, cast into anodes weighing 500–800 lb. each, is placed in a solution of copper sulphate, containing 15–20 p.c. of free acid and held in lead-lined tanks. In the multiple system these copper anodes alternate with thin sheets of pure copper, which form the cathodes. When the current is passed, the impure

Electro-Magnetic Wave. Table of an electro-magnetic spectrum, showing visible and invisible light, X-rays, radio, etc.

anodes gradually dissolve over a period of about 30 days and pure copper is deposited on the cathodes. The metallic impurities chiefly remain in the solution; the precious metals form an insoluble slime which is collected.

Silver can be refined in a solution of silver and copper nitrates. In the Thum cell, the bottom is itself the cathode and the impure silver anode is held in a canvas bag above it. The silver is deposited in crystals, as it is in the Moebius cell, where anodes and cathodes are arranged much as in copper refining. Stainless steel cathodes are used and the pure silver crystals are scraped off by wooden paddles. Gold is refined by the Wohlwill process, using a hot acid solution of gold chloride. High current densities are used and the electrolyte stirred. The cathodes are gold strip.

Nickel is frequently refined electrolytically in nickel sulphate solutions containing boric acid. The anodes and cathodes are separated by canvas, and usually aluminium sheets are used as starting blanks for the cathodes. Lead can be refined by the Betts process, which uses a system of multiple connexion: the bath is a solution containing lead fluosilicate and hydrofluosilicic acid. Bismuth, tin, iron, and antimony are other metals that can be refined electrolytically.

#### Extraction of Low Grade Metals

Electrolytic extraction of metals is mainly confined to those low grade ores which have a considerable proportion of their metallic content present in a readily soluble form. Copper is the metal most widely extracted in this way; zinc is increasingly so, the ore being first roasted and then leached with sulphuric acid. Cadmium and manganese are further examples. Metals extracted by electrolysis of their fused salts are aluminium, magnesium, beryllium, sodium, lithium, calcium, and cerium. In general the processes depend upon two factors: fused salts behave electrolytically much as their aqueous solutions do, but they are better conductors of electricity; further, electrical resistance heating will usually keep them molten. The electrolysis of fused sodium chloride, for example, results in the liberation of sodium at the cathode and chlorine at the anode. Sometimes the fused salts merely act as carriers for the material electrolysed, *e.g.* alumina. Magnesium chloride, however, is it-

self fused and electrolysed to produce pure magnesium. Usually the electrical power supplies the energy not only for electrolysis but also for heating the cells and so fusing the salts.

#### Electricity as a Source of Heat

In a third important branch of electro-metallurgy, electricity is used solely as a source of heat. No combustion method can compare with electricity in the speed at which great heat can be directed exactly where it is wanted. Electric furnaces (*q.v.*) fall into three groups: resistance furnaces, used largely in the laboratory and in small scale operations; arc furnaces, for smelting iron and steel and the production of ferro-alloys for steel manufacture; induction furnaces, restricted chiefly to the non-ferrous field. Electric steel was first introduced to supply a cheaper substitute for the high grade but expensive crucible steel. Its success soon led to applications in the alloy steel sphere. Stainless steels, containing nickel, chromium, and vanadium, tungsten tool steels, and rail steels, would in

can withstand. Arc furnaces have also been used for the distillation of zinc. Indirect arc furnaces, in which the heat, generated by an arc between two electrodes above the metal, is radiated on to the melt are used in some non-ferrous foundries.

**Electrometer.** An instrument for determining potential differences by the measurement of the displacements of charged conductors under the action of electrostatic forces. The insulation of the electrodes of such instruments is usually extremely good; they do not require a continuous electric current for their operation, although a constant auxiliary source of potential difference is needed. Except when a steady source of potential difference is being measured, the electrometer should be surrounded by an earthed shield to prevent the induction of electrical charges on the system brought about by the movement of charged bodies in its neighbourhood. Any switches used for making electrical contacts in the system must be free from contact E.M.F.s; sliding surfaces should be avoided, as they are liable to produce frictional charges. Electrometers also measure small currents such as occur in ionisation chambers. In this

application, the instrument should have as small an electrical capacity as possible.

Until recently the quadrant electrometer has been most used. It consists of a thin metal needle

Electrometer. The quadrant type: Fig. 1. The metal needle with fibre suspension. Fig. 2. Plan of needle and quadrant system. Fig. 3. Electrical connexions for measuring an unknown potential difference

all probability never have been marketed without the assistance of the electric arc furnace. The alloying elements, such as manganese, chromium, titanium, and molybdenum, added to steels to give properties necessary for modern engineering design, are usually added in the form of ferro-alloys, chiefly made in furnaces similar in design to those used in electric steel manufacture. Temperature is limited not by the degree to which the arc can be raised, but by the degree which the refractory lining of the furnace

(Fig. 1) suspended by a phosphor-bronze or silvered quartz fibre so that it hangs within a shallow circular box formed by four fixed metal double quadrants each separated by a narrow air gap. Opposite quadrants, A and A', B and B', are electrically connected (Fig. 2). A schematic diagram of electrical connexions for measuring an unknown potential difference is shown in Fig. 3. If the high tension battery is omitted and the needle is therefore directly connected to quadrants A and A', then the deflection will be in the

same sense whatever the direction of the applied potential difference, and the electrometer will measure alternating voltages. Electrostatic volt meters are often designed after the principle of the quadrant electrometer; they are more robust but less sensitive.

Other devices are: (1) The string electrometer, simple in construction and with the advantage, for small current measurement, of having a very small capacitance of about 5 micro-microfarads. It consists of a fine silvered quartz or Wollaston wire (S in Fig. 4) which is maintained taut at right angles to the electric field maintained between two parallel electrodes A and B. Any change in the potential of the string will result in its displacement, which can be observed with a microscope or recorded photographically. (2) The Hoffman electrometer, an adaptation of the quadrant instrument in which a large increase in sensitivity is secured by making the needle asymmetrical and substituting binants for quadrants. (3) The Lindemann electrometer, a compact instrument which can be actually mounted on a telescope with which it is used, in combination with a photo-electric cell, for measurement of stellar intensity. It is similar in principle to a quadrant electrometer, but four cross-connected plates replace the quadrants and a thin needle is suspended at the centre on a torsion wire.

The photographic illustrations Fig. 5, show a simple type of quadrant electrometer, and also a vertical capillary electrometer. This latter depends for its action upon an increase in the surface tension where a column of mercury is in contact with dilute sulphuric acid, when an E.M.F. is applied.

**Electro-Motive Force.** The electrical pressure developed by a cell which enables it to produce an electric current in an external circuit. The practical unit of E.M.F. is the volt (*q.v.*).

**Electron.** One of the fundamental particles that constitute matter. It received its name in 1891 from Johnstone Stoney who thought of it as the atom of electricity, *i.e.* the smallest quantity of electricity that can exist. An atom is thought to consist of a small positively charged

centre or nucleus round which electrons circulate in orbits. The electron carries the smallest possible negative charge, while a proton (*q.v.*) carries the same charge with opposite sign. Thus if the nucleus contains *n* protons and *m* neutrons (*q.v.*), *n* electrons circulate round it; the atom is electrically neutral.

An electric current consists either of the transfer of electrons from atom to atom or movement of positive ions (atoms which have lost one electron). Cathode rays, obtained by an electrical discharge through a vacuum tube, consist of fast moving electrons: Sir J. J. Thomson proved these cathode rays to be particles, but his son, Sir G. P. Thomson showed them to have the properties of a wave motion such as light, *e.g.* to be able to form a diffraction pattern. This has led to the wave mechanical theory of matter which conceives of electrons and other particles as possessing in some

which has the same charge but is 1,840 times as heavy. Electrons and positrons attract one another, and their combination causes mutual annihilation (*i.e.* they both vanish) and the production of a photon or  $\gamma$ -ray. *See* Electricity; Nuclear Fission; Nucleus; Radio-activity; Wave Mechanics.

**Electron Bomb.** Term for incendiary bomb of magnesium and thermite. It should be extinguished only by a spray of water; water in bulk spreads the burning metals. For fuller description *see* Incendiary Weapons.

**Electron Compound.** Term used in metallurgy to denote an intermetallic compound which does not conform to the normal laws of chemical valency, but has a similar ratio of valency electrons to atoms. Hume-Rothery in 1926 pointed out that alloys having the body-centred cubic structure have a valency electron/atom ratio of 3 to 2; thus CuZn has 3 valency electrons and 2 atoms, while Cu<sub>3</sub>Al has 6 valency electrons and 4 atoms. Similarly the face-centred cubic structure has a ratio of 21 to 13 and the close-packed hexagonal a ratio of 7 to 4. *Consult* Atomic Theory for Students of Metallurgy W. Hume-Rothery, 1946.

**Electro-Negative.** In electricity, negative is a term used for the return path or point of lower potential in a circuit. Early theories recognized positive and negative electricity as two separate and distinct entities (the two-fluid theory). The later one-fluid theory assumed that the negative pole of a battery or circuit was deficient in something of which the positive pole had an excess; this would cause a current to flow from positive to negative when they were connected through a conducting circuit.

A later theory, that a current flow is caused by the handing on of electrons (*q.v.*) from one atom to another, recognized that the electron is itself negative and that the negative pole has an *excess* of electrons—the positive pole being deficient. This may seem confusing; but a flow of negative electrons from negative to positive may still be regarded as a current flow from positive to negative so that, for all practical purposes, conceptions of electric circuits can remain unchanged. A chain of buckets of water passed from a well to a fire and returned empty may equally be regarded as a chain of air-filled buckets passing from the fire to the well. *See* Electro-Positive.

Electrometer. Fig. 5. Vertical capillary electrometer, left; simple quadrant type, right

way at the same time both particle and wave properties. This means that the picture of the atom given above is only a very crude approximation.

The mass of the proton (or hydrogen nucleus) is 1,840 times that of the electron and is virtually the same as that of the neutron. Thus the mass of an atom resides in the nucleus. A particle with the same mass as, but of opposite (positive) charge to, the electron has been discovered in cosmic rays. It is called the positron, and should not be confused with the proton

## ELECTRONICS: A NEW DEVELOPMENT

W. Wilson, D.Sc., Manager G.E.C. Development Lab.

*This article explains the principles governing electron flow and transmission, and outlines the main applications of the science of electronics. Cross-references are given throughout the article to relevant entries elsewhere in this Encyclopedia*

Electronics is that branch of electrical engineering which depends on the passage of an electric discharge through a rarefied gas. Its operation had been recognized since the beginning of electric power engineering; its application began to accelerate about 1934.

The nature and scope of electronics can be indicated by a brief historical survey. A century ago electric power was devoted to one main purpose, the production of light. This was supplied by means of three types of lamp, the arc,

modified as in (3) to serve purely as a rectifier. The large continuously evacuated steel tank form (4) followed, and the gap between (3) and (4) was bridged by the pumpless steel tank rectifier (5). The last three all possess a mercury pool at their base as a cathode, and 3, 6, or 12 anodes.

**Discharge Tube** (Fig. 1, B). Not long after electricity was first generated by frictional machines, it was found capable of producing a luminous discharge in an evacuated enclosure, usually known as a

beam of cathode rays was recognized as a stream of electrons. The industrial form illustrated in (5) was not very different except in details (such as the hot filament cathode and the flattened end); and the large metal-tube continuously evacuated model (6) contained much the same parts with additional refinements, such as the revolving film drum. The electron microscope (7) was a cathode-ray tube with three carefully designed electron lenses.

**Filament Lamp** (Fig. 1, C). The incandescent lamp (1) in its first form had a carbon filament. It was soon discovered that carbon particles were discharged from the filament to the inside of the bulb away from the negative end, and that the positive limb cast a shadow, i.e. a thin streak free from deposit. Fleming recognized this in 1904 as due to an electron stream coming from the more negative part of the filament, and embodied the principle in his hot cathode valve (2), which functioned as a rectifier. A third electrode, or grid, was added to form the triode (3); more grids produced, for example, the pentode (4). By inserting a trace of gas or mercury into the vacuum, the gas-filled rectifier diode (5), and G.F. triode or thyatron (6) were evolved, with higher efficiency and current capacity than the vacuum types. A diode with a light-sensitive cathode varied its resistance to current flow in proportion to the light intensity, and constituted the photo-electric cell (7).

A scrutiny of these develop-

ments reveals that definite electronic action appeared at the outset in all of them. Further, in the first and third series, the mercury rectifier A3 is virtually the same device as the small gas-filled rectifier diode C5, magnified by, say, 10,000 to 50,000. Mercury arc rectifiers of all kinds were actually long-established and highly efficient valves, so that the achievements of the radio valve could be repeated on a power scale

discharge tube, and incandescent filament. Each gave rise to a separate line of development, shown graphically in Fig. 1.

**Electric Arc** (Fig. 1, A). When two conductors energised at a voltage exceeding about 40 are touched together and then separated by a short distance, the luminous discharge known as the electric arc (1), consisting of a flow of electrons, passes across the gap. Burning of the electrodes is much reduced by enclosing the arc, and prevented altogether by evacuating the enclosure; hence the mercury vapour arc (2), found to possess rectifying properties, since the electron flow could pass only from the mercury cathode to the anode, and the design was then

Geissler tube (1). The amount of light emitted was small, but both intensity and colour were modified later by varying the residual gas and by coating the inside surface with a fluorescent material. Sufficient light was given by the Moore tube (2), which contained a small amount of nitrogen, to give it a short life as a practical illuminant round about 1908. The principle was to be successfully revived later as the fluorescent lamp. Crookes investigated the nature of the discharge, and designed the tube bearing his name (3) by which strong cathode rays, and incidentally X-rays, were generated. A further development by J. J. Thomson gave the cathode ray oscillograph (4), in which the

by suitably increasing the size of the various components, and adding features from one line of development to apparatus in another.

Description follows of important pieces of electronic equipment and processes. (The references, unless otherwise stated, are to the diagrams in Fig. 1.)

**Thermionic Valve** (Fig. 1, C). It is of interest to examine the differences, apart from mere size, between the small rectifier tube C5 and the power rectifiers A3, A4, or A5. The chief difference lies in the means for starting the discharge. In C5, the filament cathode is heated by the current passed through it, causing electrons to come out of it into the space nearby. Then the application of the voltage between anode and cathode (called the anode voltage) causes the electrons to move towards the anode when the negative terminal is connected to the cathode, the electron flow forming an electric current. When the polarity is reversed, the electrons are attracted into the cathode, and no current passes.

**Mercury Arc Rectifier.** In the power rectifier, the arc is actually struck by means of an auxiliary igniter anode, which is raised

bodily so that contact is broken with the pool cathode. A further difference is in the cathodes themselves, the mercury pool being indestructible, as compared with the filament's life of perhaps 10,000-15,000 hours. The 600-ampere 6-phase pumpless rectifier in Fig. 2 is typical.

**Grid Control.** The effect of a control grid in an electronic device should be understood for both D.C. and A.C. circuits, and for vacuum and gas-filled tubes. In a high vacuum tube such as the triode, C3, which is primarily intended for use on D.C., the grid voltage continuously controls the flow of electrons from the cathode, and hence the anode current; the latter starting, fluctuating, and

ceasing according to the same series of changes as the former. But in the gas-filled triode, C6, the grid can simply initiate the current, which immediately rises to its full value. The grid is thereafter powerless to vary or stop it.

**Electronic Motor Control.** When used on an A.C. circuit, the grid can cause the current to start at any desired point in each cycle, and hence not only rectify, but also regulate, the R.M.S. value of the current. By employing a D.C. motor in a valve-controlled A.C. circuit, starting, stopping, reversing, and speed control are effected sensitively and conveniently.

**Grid Rectifier** The advantages of a control grid have been added to the power rectifier in Fig. 2, the grids being connected and sup-

ported by the small bushes seen near the anodes.

**Inverter.** An A.C. of any desired frequency can be obtained from a D.C. by means of a gas-triode, or,

Electronics. Fig. 4. High frequency heating. Above by eddy current; below by capacity current. Note: In E.C.H. the charge forms the short-circuited secondary of a transformer, and in C.C.H. the dielectric of a condenser. Heating is due to the losses in each case

on a large scale, from a grid rectifier. A pilot voltage of the desired frequency is applied to the grid, and causes a power A.C. to appear at the anode.

**High Frequency Heating.** Like the rectifier stage of a radio set, the oscillator stage can also be designed on a large scale, as exemplified by the 4kW set shown in Fig. 3. A typical use for such sets, rated at 4, 10, 25, 75, and even 2,000 kW, is the heating of conductors by inducing eddy-currents in them, and insulators by means of capacity currents, as indicated in Fig. 4. The heat is developed exactly where it is wanted, and

Electronics. Fig. 5. Alternator wave showing 1,200 cycles per second ripple

Electronics. Fig. 6. Radiolocation record. See next page

exact temperatures can be obtained by suitable timing of currents; while a great saving in time is usually effected.

Electronics. Fig. 7. Four typical electron lenses. Upper, electrostatic; lower, electromagnetic

**Photo-electric cells.** Of three types of photo-electric cell, that shown as C7 is the most generally useful, largely because it combines well with the standard amplifier. Its principal function is to act as a substitute for the human eye. It can count the number of products coming from a machine, open a door when a person is about to enter, control the closing of swing bridges, or sound an alarm when smoke is present. It transforms the fluctuations of light on the sound track of a talking film into similar fluctuations of sound.

Electronics. Fig. 8. Cross section of R.C.A. electron microscope showing electron discharge tube at a; the lenses at b, c and d; air lock for inserting specimens at f; control and meter panel at k, and viewing ports for fluorescent screen at base

**Cathode-Ray Oscillograph.** If the discharge of electrons from the anode, which is permitted to spread out over the whole space within the enclosure of a valve, be limited to a thin beam by being passed through a small aperture, it will produce a luminous spot on the fluorescent screen at the end of the tube. Now the beam consists of negative particles and can be deflected by a charged plate (or plates) placed as shown in B4; while the stream of negative particles forms a current, which can be deflected by a magnet or sole-

these and any reflections upon the graph. A radio transmitter is used to generate a succession of pulses, and a receiver connected to the oscillograph to record them; the former being synchronised with the cross-traverse (time-sweep) of the oscillograph spot. The resultant trace on the screen is similar to that in Fig. 6, where the left-hand peak is the image of the initial pulse, and the other two register the arrival of reflections from two separate objects, e.g. aeroplanes, ships, or icebergs. As the signal travels both ways with

Electronics. Fig. 9. Smoke from burning zinc, forming four-spiked dendritic crystals. Magnified by 30,000. See next page

noid. If a fluctuating voltage or current be connected to the deflecting plates or solenoids, the spot will move instantaneously through a distance proportional to the quantity to be measured. A transverse feed can be afforded to the record by a rotating drum as in B6, or by means of a second pair of deflectors at right angles to the first. In this way an extremely sensitive measuring and recording instrument has been formed. An example of its work is seen in Fig. 5, where a voltage wave from an alternator has been recorded, including a fine ripple with a frequency of 1,200 cycles per second.

**Radiolocation.** The presence of a solid or conducting mass can be detected and its distance accurately measured by sending out radio waves and recording both

the speed of light, and the distance to the object concerned, the latter can be read off quickly.

**Flaw Detection.** By using a quartz crystal to convert the radio-frequency signal to a high-frequency sound (supersonic) vibration, and also to convert back the echo to an electric wave, radiolocation can be applied to the location of flaws in solids. The record in Fig. 6 (p. 3011) was taken by the Hughes flaw detector upon a steel forging, the two echoes coming from the far side of the forging and from a cavity within it respectively. The same method is used for sounding at sea, and for measuring height above the earth surface in aircraft.

**Electron Lens and Microscope.** Both methods of deflection make it possible to focus an electron

beam, just as light rays are focused, by glass lenses. Electric and magnetic fluxes alike can refract the rays, four typical electron lenses being shown in Fig. 7. Those in A and B are electrostatic, used in glass cathode ray tubes, the fluxes being produced by maintaining the electrodes at different voltages as shown. Lens A functions like the condenser lens of a projecting lantern, since it collects rays coming from the cathode and concentrates them through the aperture; while B focuses the rays to a spot. The remaining two are electromagnetic lenses, C being of long focus for a metal tube oscillograph, and D of very short focus for a high-magnification electron microscope. In all four the focus is adjustable by variation of the voltage of one electrode, or the current in the coil. Electron lenses could be used for magnifying purposes like glass lenses. The sectional elevation in Fig. 8 shows the general arrangement of a practical electron microscope (*see* Electron Microscope) in which the three lenses are electromagnets like D in Fig. 7. They have the same functions as in the light microscope, with a condenser to illuminate the object, then an objective, and finally an eyepiece or projector lens; the last projecting the enlarged image on the fluorescent screen or photographic film. The results so far obtained by the electron microscope have been sensational. Typical examples are shown in Figs. 9 and 10.

**Television.** A cathode ray tube with a condenser lens like A in Fig. 7 and two pairs of deflectors at right angles to each other can function as a television receiver;

for the spot can be moved in a series of contiguous parallel lines to cover the whole picture space in  $\frac{1}{25}$  sec., and its brightness can be varied from maximum to zero by varying the voltage applied to the cathode shield (Fig. 7A). Tubes with screen diameters of 6, 12, or 18 ins. are used in practice. The transmitter is essentially the converse of the receiver, incorporating an electrically sensitive screen upon which the optical camera lens projects the original scene.

**Electronics.** THE INSTITUTION OF. Founded in 1930 by scientists and engineers who were interested in the applications of high frequency electricity, particularly in the field of telecommunications. The study of the electron from the standpoint of the physicist and the theory and practice of electrotherapeutics became matters of importance to members, and so the scope of the institution was widened. Membership is classified according to the special interests of members in physics, applied electronics, and electrotherapeutics. Incorporation was granted on Aug. 28, 1935.

**Electron Microscope.** The electronic equivalent of the light microscope, the comparison between the two optical systems being illustrated in Fig. 1, where a typical electron instrument is shown on the left, and a light microscope projecting its magnified image downwards on the right. Three lenses are required in any microscope: a condenser to concentrate the illumination upon the object, an objective to give an enlarged image of the latter, and an eyepiece or projecting lens to produce a further enlargement of

**Electron Microscope.** Fig. 1. Optical systems of electron (left) and light (right) microscopes

a fluorescent screen, instead of the retina of the human eye or a ground-glass screen, receives the final image. An example is shown in Fig. 2.

The useful magnification which can be given by the electron microscope is about 100,000 times as compared with 1,000 times for the light microscope. The reason for this is that details cannot be distinguished which are smaller than half the wave-length of the illuminant, and visible light reaches the limit at 1,000 magnifications. As the wavelength of the electron beam employed is about  $10^{-5}$  that of light, an improvement of  $10^5$  times is in theory possible. *See* Electronics.

**Electrophorus.** Simple electrostatic machine or generator of electricity. It was invented by the Italian scientist Alessandro Volta in 1775, and consists of a metal dish called the sole-plate; a layer of some good non-conducting substance, such as resin, glass, india-rubber, ebonite, or pitch; a metal disk, called the cover, rather smaller than the sole-plate; and an insulated rod attached to the disk and serving as a handle by which it may be lifted.

In using the apparatus the parts are usually first warmed to ensure that they are dry, and the resin base is then struck or rubbed

**Electron Microscope.** Fig. 2. R.C.A. electron microscope showing large ports above instrument desk for viewing second image

**Electronics.** Fig. 10. Typhoid bacterium showing flagellum. Magnified  $\times 66,000$

with a piece of cat's-skin or other fur, or a piece of dry woollen cloth, and is thus electrically excited,

Electrophorus, the simplest electricity maker. For explanation see text

the charge of electricity developed upon it being negative. The metal upper plate is then placed on the resin base; it does not, however, receive from the resin any direct charge of electricity, but by induction develops a charge of positive electricity on the surface of the disk where it is in contact with the resin,

and a charge of negative electricity on the upper surface of the disk, as shown in the sectional illustration. If now the upper surface of the disk be touched with a finger and thus put into electrical contact with the earth, the negative charge of the disk will pass to earth leaving the disk positively electrified throughout; and if lifted away from the resin the disk will give a spark if the knuckle or any conductor be brought near it.

The sole-plate performs an important function by the mutual induction which takes place between it and the upper plate or cover. When the latter develops its positive charge on being put in contact with the earth, the sole-plate receives a corresponding negative charge from the earth, and in this way the original positive charge of the cover due to the negative charge of the resin base may become an appreciable amount. Providing insulation is good the electrophorus may be worked almost indefinitely, i.e. every time the cover is put back on the base and its surface touched with the finger the action takes place and a spark may be obtained when the cover is lifted.

**Electro-Plating.** The deposition of a metal on another substance, usually another metal, by electro-chemical action, either for the purpose of protecting the latter metal from corrosion, as when iron is electro-plated with copper, or for the purpose of giving the appearance and some of the properties of one more costly, as

when a teapot of base metal is plated with silver.

The scientific principle upon which the art is immediately based is described under Electrolysis. The operation can be carried out on a domestic scale with small and simple apparatus; but when carried out on a commercial scale a large vat or bath is used, constructed usually of stout wood lined with lead or slate, though sometimes asphalt or cement is used, or the vat may be built of enamelled iron. It is usually rectangular in shape, and is fitted with a flange round the top, to which are attached two rectangles made of brass tubing, one being a little larger all round and fixed a little higher than the other, as shown in the illustration. The rectangles, and the vat itself, are insulated both from one another and from the earth.

#### Composition of the Bath

The outer ring is used to take the current into the vat, and is known as the anode ring; the current passes out through the other rectangle, the cathode ring. The bath is filled with a solution which varies according to the nature of the work to be done. Electric current is furnished by a dynamo which gives a large current at low voltage. The articles to be plated, when of convenient size, are suspended in the solution by means of wires from crossbars resting on the cathode ring; while plates of the metal which is to be deposited on the articles are suspended from similar bars resting on the outer or anode ring. The arrangement enables many articles to be placed in one vat together with an appropriate number of anode plates, which may be disposed along the brass rectangle as most convenient.

A simple example will serve to illustrate the entire process, whatever the metal that is to be deposited. Suppose that a teapot of

pewter or other alloy is to be plated with silver. The teapot is first highly polished by rotating "bobs" covered with felt and carrying an abrasive compound, and then by "mops" of linen. It is made chemically clean, by hand scouring, or caustic potash or soda, or pickling in acid, followed by hot water swills; it may be "degreased" by a solvent such as petrol or trichlorethylene. An operation known as "quicking" sometimes follows; the teapot is dipped in a solution of cyanide of mercury which forms a thin deposit of mercury on the surface, this facilitating the silver deposit and giving better adhesion. The teapot is suspended in the vat from one of the crossbars of the cathode ring, as shown in the figure. The solution is prepared from cyanide of potassium and cyanide of silver precipitated from nitrate of silver, in water. It contains 1½-3 oz. of silver to the gallon.

The anode plate is of commercially pure silver; it is, of course, connected with the positive terminal of the dynamo or battery. When the current passes, the silver in the bath is thrown out of solution and deposited on the teapot, while at the same time an equal amount of silver is dissolved off the anode plate, and, entering into solution in the bath, takes the place of that deposited on the teapot. The process goes on so long as the current is maintained, until the anode is entirely dissolved or until as much silver has been deposited on the teapot as desired. The time occupied ranges from two to twelve hours or longer. The amount actually deposited on such an article as a teapot is about 1½ oz. per sq. ft. of surface covered, the thickness of ordinary writing paper. The teapot, as it leaves the bath, has a fine granular-looking surface of chalky whiteness. The smooth, bright surface of the finished article is given by further polishing after a thorough washing in plain water, dipping in boiling water, and drying in hot sawdust.

While silver is frequently used for table-ware, etc., copper, nickel, and chromium are in common use for decorative work. Cadmium, replacing nickel, is frequently used unpolished for anti-rust protection of steel screws. Zinc, tin, and lead are electro-plated for protective purposes. Palladium and rhodium will

Electro-plating. Diagram showing how articles are electro-plated with silver

provide an untarnishable skin on silver. All these processes are similar in principle to that already described for silver. Often the desired result cannot satisfactorily be obtained directly without a preliminary plating of another metal. Steel before nickel-plating frequently receives a first coat of copper. Chromium is usually deposited over nickel.

Electro-plating is a complex art, and many different methods and baths are in use. Improving technique constantly enhances the quality and adhesion of a deposit; the speed of deposition; the reduction of expense; and the omission of preliminary coats of other metals. Much work is carried out automatically, the parts to be plated being loaded on to a moving conveyor, which carries them down a line of tanks containing the various cleaning solutions; the actual plating bath, and hot and cold water swills. The time spent in each bath is automatically controlled, and little supervision is required except for loading and unloading.

**Electro-Positive.** In electricity, positive usually refers to the source of current flow, or point of higher potential. See Electro-Negative.

**Electroscope.** Term given to an instrument for determining whether a body is electrified or not, and if so, the character of the electrification, whether positive or negative. In its simplest form it consists of two small balls of pith suspended by silk threads from the arm of a metal stand, as shown below. An almost equally simple form is represented by the balanced needle, similar to the needle of a mariner's compass, devised by Dr. Gilbert of Colchester in 1600.

The electroscope usually consists of a glass bell jar commonly fitted with a brass ring round the bottom or fitted to a wooden base so as to be easily removable. The jar has a stopper of ebonite in which is fitted a stout brass wire with a removable plate or ball at the top, and from the

bottom of which two strips of gold or

aluminium leaf depend. Opposite each strip and within reach of its end is a strip of tin foil attached to the interior surface of the jar. A glass rod, electrically excited by having been rubbed, if brought near the instrument will cause the leaves to repel one another; in favourable conditions so sensitive is the instrument that the leaves will begin to move apart while the glass rod is several feet away. What happens is that the electricity on the rod attracts the opposite kind into the plate or knob of the electroscope and repels the same kind into the leaves, which fly apart in accordance with the well-known law that like electricities repel and unlike attract.

is to be determined be brought near the plate and the leaves diverge still farther, the body is electrified positively; if the leaves close, it has a negative charge. The strips of foil on the sides of the jar prevent the leaves from being damaged by the violence with which they are repelled or from adhering to the sides of the jar. The instant the leaves touch the foil they lose their charge to the earth, and fall back into their normal positions.

Whereas the electroscope is used to determine whether a body is electrified and the kind of electricity with which it is charged, a more developed instrument to measure potential difference is the electrometer (*q.v.*).

**Electrostatic Machine.** Machine for the conversion of mechanical work into electric energy. There are two kinds, frictional and influence machines. Ramsden's plate electrical machine belongs to the former class, and Wimshurst's well-known apparatus to the latter. Machines to produce two million volts or more have been designed by van der Graaf and others. They consist essentially (see illus.)

of a belt BB of insulating material upon which charges are sprayed by means of a "comb" C, which is connected to a unidirectional potential difference of 20,000 volts provided by the generator G. The charges are carried up by the moving belt BB into the inside of a hollow conducting but insulated sphere S, which collects the charge through the action of the collecting comb D. P is an earthed metal plate.

**Electrostatics.** Term applied to that branch of the science of electricity which is concerned with electricity at rest or with electric charges, and is particularly occupied with the measurement of such charges. The science deals alike with the most elementary facts of electricity such as the phenomena exhibited by a rubbed glass rod, and with the profound problems associated with the electrical relations of atomic particles.

**Electrotherapeutics.** The application of electricity to medicine. When the idea arose that electricity was a vital force, it was first recognized as a force that kills. The conception that it would cure the physical ills of man came later. Unfortunately a good deal of charlatanism has been associated with the study of the curative powers of electricity. Thus, magnetism alone has no physiological action; any curative effects which magnetic appliances produce are due not to electric power, but to the warmth which they communicate to the body of the patient and to the faith which they inspire in him.

In 1678 Swammerdam showed that a muscle of a frog's leg hanging by a thread of nerve, bound with silver wire, would instantly contract if nerve and wire were simultaneously touched by a piece of copper. Galvani and Volta a century later excited general scientific interest in the physiological effects of electricity by recording this same experiment.

In practice, electricity is used in the following forms: low frequency—faradic, galvanic, sinusoidal; high frequency—short wave and long wave diathermy.

*Faradic current* has the power to make a muscle contract and is used to bring increased tone to a weakened muscle. It is especially useful in after treatment of sprains and fractures, in paralysis, and in post-operation conditions. The faradic battery is used to test the degree of impaired innervation of a damaged muscle or muscle-group, when, in conjunction with the galvanic current, it is often possible to calculate the degree of damage by the varying response, or comparative reaction, to these two currents. Ions of substances of curative value such as histamine, sodium salicylate, or potassium iodide, can be introduced into a localised area by a direct *galvanic current*, some under the positive electrode, some under the negative electrode, according as the substance is electro-positive or electro-negative. The active pad of sixteen thicknesses of lint wrung out in ordinary tap water, in which is a varying low percentage of the substance to be used, is placed over the affected part and the indifferent electrode placed so that the electrical current passes directly through the part to be treated. A drug can thus be directed to a localised area.

*Sinusoidal current* is used as a general stimulant to increase circulation. Typical conditions treated are chilblains, venous congestion, and stages in infantile paralysis.

The above three currents can each be given to a single limb or to all four limbs through a water bath. This is known as Schnee bath treatment. If the water is heated and given a whirlpool effect, the treatment is reinforced.

#### Diathermy Treatment

Diathermy is used where a deep heating effect is desired. The word suggests heating through, whereas radiant heat is diffused. Diathermy treatment has direct impact on sick tissues; it is useful in disorders of the rheumatic group, pain following injury and internal low grade infection, and most inflammatory conditions, e.g. sinusitis, shingles, boils. Short-wave diathermy has now almost entirely superseded long-wave. Ultra-violet light radiation can be obtained from a quartz burner or a carbon arc. General sunlight baths probably benefit sufferers from debility, though it is difficult to reconcile statistics with this statement. Artificial sunlight falling upon skin disinfects the surface from germs and increases the activity of cells beneath the

skin. It synthesises vitamin D, as does natural sunlight, by action on the cholesterol found in the skin. It is used as a counter-irritant in obstinate neuritis.

Electricity is also used to illumine certain cavities of the body, such as the lower bowel and the bronchi; minute lamps are fixed to delicate instruments with a complicated arrangement of mir-

metal deposited does not become an intrinsic portion of the article on which it is laid, but is removed from the latter after it has been deposited; its object is not to encase or permanently cover one metal with another, but to make a copy of a surface. It is largely used for making reproductions of coins and medals and other works of art, and for preparing electrotypes for

Electrotyping. 1. Smoothing out the wax. 2. Wax mould in position. 3. Wax impression from block. 4. Copper shell on mould taken from electrolytic tank. 5. Peeling shell from mould. 6. Pouring in backing of molten lead

rors, allowing of the examination of the parts by the surgeon. The electric needle can destroy the roots of disfiguring hairs, and even remove warts and moles. Powerful electro-magnets pull particles of metal out of the eye. X-rays (*q.v.*), while not strictly electrical, are indirectly so, being a secondary product of electric action.

Hilary Ledgerwood, M.B.

**Electrotyping.** Particular form of electro-deposition. It differs from electro-plating in that the

printing, both from type matter set up in the usual way and from engraved surfaces in wood or metal. Fine half-tone blocks for illustrations are duplicated in this way. Electrotypes is the term given to the product.

If a reproduction of a medal is required, and the original is not too valuable to be risked in the depositing solution, it can be used as the cathode of the operation. It is prepared by having a wire twisted round its edge, leaving sufficient

length for attaching to the terminal of the electric battery or machine. The face which is not to be copied is embedded in gutta-percha; the face to be reproduced is slightly greased with olive oil by a fine hair brush, to prevent a too powerful adhesion of the deposited metal, after which the medal is ready for the bath.

The solution is prepared according to the metal to be deposited, usually copper; after 12–24 hours the deposit will have acquired the necessary thickness, probably about 0.015 in., and the medal will be removed from the bath, when the electrotype can be detached. If now a mould be taken of this electrotype, and then another electrotype taken off that mould, the second electrotype will be a duplicate of the face of the original medal. A duplicate of the other face of the medal being obtained, the two halves can be trimmed and soldered together, making a complete reproduction of the original. In this way copies of rare or historic coins and medals in museums have been made.

If the original coin or medal is too precious to be risked in the electrotype bath a plaster cast will be prepared, or a mould in gutta-percha by the aid of pressure.

#### Electrotyping from Type

A similar moulding process is necessary in the preparation of an electrotype from a forme of type. The type is first thoroughly cleaned, dried, and blacklead. A shallow tray is filled with a molten mixture of beeswax, Venice turpentine, and graphite, and the surface, when set, blacklead. The forme of type is then forced into this mixture by pressure and a mould thus produced. This mould is coated all over with graphite, and has a copper wire embedded in it all round the impression which is to be reproduced in order to increase the conductivity of the mould when in the bath, the wire being connected with the terminal of the vat, in which the mould becomes the cathode.

The anode is a plate of copper and the solution is acidified copper sulphate. A powerful current is used to give a rapid deposition and secure the necessary thickness in the shortest possible time. When the electrotype is finished in the bath it is removed and separated from the wax bed by melting the latter in hot water, after which it is laid face down on an iron plate, heated, surrounded by a frame of iron bars; and molten "back-

ing" metal, consisting of lead hardened with a little antimony and tin, is poured over it to a depth of from  $\frac{1}{4}$  to  $\frac{3}{8}$  in. It is then trued up on a steel plate by hammering till perfectly flat, trimmed, and mounted on a wooden block to make it "type high"; or if it is to be used on a rotary printing machine it is bent by rollers to the required curvature. If many impressions are to be taken the electrotype so prepared can be "steel faced" by having a deposit of iron given to it by a separate operation in an electrolytic bath.

Improvements in stereotyping deprived the electrotype of some of the value which at one time it possessed; and a process of plastic moulding, in which the mould is obtained by a combination of pressure and heat in a thermoplastic material such as vinylite, was an improvement on the wax moulding and blackleading method. The plastic mould is rendered electrically conductive for the deposition of the copper by a thin coating of silver, which is put on by spraying the mould with solutions of the necessary chemicals.

**Electrum.** Term applied at various times to different materials. In ancient days it was given to amber; in the Middle Ages to brass; more recently to an alloy of copper 8 parts, nickel 4, and zinc 3.5 (sometimes the nickel is 6 parts), a beautiful artificial silver with a bluish tint much used for the manufacture of drawing and other instruments; also to an alloy of copper, zinc, and tin, and to native minerals containing gold and silver, the latter 20–50 p.c. An alloy of gold and silver (15–35 p.c. silver) known by this term, of a pale yellow colour (hence the association of the material with amber), was much used by the early Greeks and Romans for ornaments and coins. The earliest coins known were made of it. Rods having 651 parts gold and 334 silver in 1,000 were used as money in Asia Minor.

**Elegy** (Gr. *elegos*). Originally a threnody or lament written in elegiac metre, each couplet in which consisted of a hexameter and a pentameter. The theme of such songs varied, the term being employed for the form rather than the spirit. In modern literature the elegy has mostly been associated with the spirit rather than the form, and has come to be understood as a short mourning, or memorial song, usually a tribute to an individual, but sometimes of a more generally mournful character,

as is Gray's *Elegy Written in a Country Churchyard*, 1751.

Earlier poets used the term with wider significance, as when Donne described a series of his amatory poems as *Elegies* and labelled his memorial poems specifically *Funeral Elegies*. Although there were earlier memorial poems of distinction, such as the beautiful anonymous *The Pearl* (14th century) and Chaucer's *Book of the Duchess* (c. 1369), these can hardly be strictly described as elegies owing to their length and treatment. Some of the more notable elegies in English are Spenser's *Daphnida*, 1591 (on Lady Douglas), and *Astrophel*, 1595 (on Sir Philip Sidney); Milton's *Lycidas*, 1638 (on Edward King); Shelley's *Adonais*, 1821 (on John Keats); Tennyson's *Ode on the Death of the Duke of Wellington*, 1852 (his *In Memoriam* is rather a series of elegiac poems than an elegy); Matthew Arnold's *Thyrsis*, 1867 (on Arthur Hugh Clough); Swinburne's *Ave Atque Vale*, 1867 (on a false report of Baudelaire's death); and William Watson's *Lachrymae Musarum*, 1892 (on Tennyson). See *Poetry*.

**Elektra.** Opera in one act by Richard Strauss, with text based on Sophocles's drama by Hugo von Hofmannsthal. In this work Strauss reached his climax as one of the most complex of composers (in his next work, *Der Rosenkavalier*, he returned to simpler forms). The musical characterisation in *Elektra* is masterly, and the opera is one of the most dramatic in the Strauss repertory. First performed at Dresden, Jan. 25, 1909, it was produced at Covent Garden under Beecham the following year.

**Elektron Alloys.** A group of light alloys with a magnesium base and varying amounts of aluminium, manganese, and zinc. Aluminium is added up to 10 p.c. to increase the strength; zinc up to 4 p.c. enhances this effect;  $\frac{1}{2}$  to  $2\frac{1}{2}$  p.c. manganese improves resistance to corrosion. Up to 1 p.c. cerium improves the mechanical properties at raised temperatures. Elektron alloys, being the lightest commercial alloys known, are used for aircraft engine parts, landing wheels, airscrews, etc., and for gear cases and parts of motor cars. They may be cast or wrought hot, but not cold. Some heat treatment and ageing are necessary to produce the optimum properties, but they are never quite so strong as best aluminium alloys. They are best joined by

Elephant. Left, African elephant, valuable by reason of its ivory tusks. Right, Asiatic elephant showing the whitish markings characteristic of this species

Photo of Asiatic elephant by Gambler Bolton, F.Z.S.

gas welding or the argon arc process. See Electric Welding.

**Elemental Spirits OR ANGELS OF THE ELEMENTS.** Spirits supposed to rule over the four elements of fire, water, air, and earth. The Jewish Kabbalists and the Gnostics of early Christian days largely developed this idea and introduced a host of minor angels or spirits who had charge of departments of the four great elements, such as wind, rain, etc. Hence arose an elaborate system of angelology not unlike demonology, but generally beneficial. In the Middle Ages, the spirits of fire were known as Salamanders; those of water as Nixies or Undines; those of air as Sylphs; those of earth as Gnomes. The name Salamander survives as that of a batrachian reptile supposed to be capable of living in fire.

**Elementary Flying Training School.** R.A.F. establishment for training air crews. After their training in ground subjects at an Initial Training Wing air crew personnel pass to an E.F.T.S., where they not only learn to fly primary training aircraft, but also receive instruction in navigation, photography, armament, bombs, and night and blind flying.

**Elements.** In chemistry, the ninety-odd substances from which all solids, liquids, and gases are constructed. See Chemical Elements; also table under Chemistry.

**Elements.** In astronomy, a set of seven numerical quantities which specify completely the orbit of a planet, comet, or double star and enable its position to be calculated for any given time, past or future. Five of the elements define the size, shape, and orientation of the orbit; the other two suffice to locate the object in the orbit.

**Elemi.** Resinous exudation from a number of tropical plants,

especially *Canarium luzonicum*, a tree growing in Manila. The resin is of a pale yellow colour resembling stiff honey in consistency. It has an odour which reminds one of fennel. Elemi was formerly used in medicine as a stimulating application to wounds. The ointment contains about 20 p.c. elemi.

**Elephant** (Gr.-Lat. *elephas*). Family of large, hoofed mammals, surpassing in size all existing mammals. Only two species now survive, the African (with large ears and small eyes) and the Asiatic (with small ears and large eyes), though several others are known in the fossil state. The feature which distinguishes the elephant from all other mammals is the development of the nose into a long flexible trunk, used by the animal in conveying food to the mouth, and also for drawing up water which is afterwards squirted down the throat.

In dentition the elephant is unique. The incisors, which are found only in the upper jaw and are two in number, are developed in the male, sometimes in the female also, into a pair of long curved tusks. These tusks are quite different from those of the boar and other animals, which are simply large canine teeth. The elephant has no canines. Only two cheek teeth or molars, on each side of both jaws, are ever in use at any one time. These teeth are of great size, probably compound, and the surface consists of a large number of transverse ridges of enamel, parallel in the Indian and enclosing lozenge-shaped spaces in the African elephant. As these molars become worn out they are replaced by the reserve teeth, which grow through the gum.

The ponderous body of the elephant is encased in thick wrinkled

skin, covered sparsely with coarse hair in the young animal but almost bare in the adult. The legs are massive, and the knee joints are much lower down than in most hoofed animals. This causes the elephant, when lying down, to rest with the hind legs bent, while the fore legs are thrust out in front.

The head is enormous, and suggests the presence of a large brain. The brain is actually small for the size of the animal and is placed at the back of the head, the huge skull consisting of a mass of bone completely honeycombed by cells, an arrangement which provides for the attachment of the jaw and trunk muscles without making the skull so heavy as to be a burden.

Elephants are entirely vegetarian, feeding on leaves and twigs and on grass which they gather by the aid of their trunks. Trees are often uprooted by pressure with the head for the purpose of feeding on the branches. Where force is required, the elephant relies upon leverage with the tusks or pressure with the skull. The trunk is a delicate sense organ for smell and touch, and the animal is careful to keep it out of the way of rough usage. When an elephant holds a heavy weight it rests it on the tusks or holds it with the teeth, using the trunk only to steady it.

The Indian elephant is easily distinguished by its massive bulbous head, small ears, and the presence of four nails on the hind feet. It is dark grey, but occasionally more or less blotched with white. This elephant is rarely much more than 9 ft. high at the shoulder. It has been known to live in captivity for over a century, and in the wild state probably attains a much greater age.

The African elephant has a smaller and narrower head, large

fanlike ears, and only three nails on the hind feet. Its trunk has two finger-like processes instead of one. It also attains a greater height, has longer legs, and a generally less heavy and clumsy appearance. Owing to continuous destruction for the sake of its tusks, the African elephant has been greatly reduced in numbers. This is of more savage disposition than the Indian species. Economically the African elephant is valued for its ivory, the Indian as a draught animal.

**Elephant.** Island of the South Shetlands, Antarctica. The most northerly of the group, it lies S.E. of Cape Horn and Drake Strait.

**Elephant, ORDER OF THE.** Danish order of knighthood re-founded

Order of the Elephant. Danish badge of knighthood

in 1458 from an earlier institution, and remodelled in 1693. It is limited to 30 knights, exclusive of the sovereign and his sons, and is conferred only upon Protestants. The badge is a white elephant; the ribbon is of light blue watered silk.

**Elephanta** or **Gharapuri.** Island in Bombay Harbour, India. From 4 m. to 4½ m. in circumference, it consists of two long hills. It was so called by the Portuguese from a large stone elephant. The island is famous for its caves or rock temples, supposed to date from the 9th century. See Cave Temple illus.

**Elephant and Castle.** Design found in early MSS. and in medieval times. Elephants carrying

armed men into battle were used in the East from immemorial days. They were first encountered by the Romans during the war with Pyrrhus in the 3rd cent. B.C. Polyænus records that an elephant carrying archers in a houdah led the advance when Julius Caesar forced the passage of the Thames near Chertsey in 54 B.C.

Caesar Frederick, a Venetian merchant of the 16th century, states that the king of Pegu had 4,000 war elephants with castles on their backs, and the Cutlers' Company, who had a large trade in ivory, adopted the animal so castled as their crest.

Elephant and Castle badge

**Elephant and Castle.** London tavern in the met. bor. of Southwark, 1¼ m. S. of Ludgate Hill.

Elephant Apple. Leaves, flower, and fruit, showing arrangement of seeds within the fruit

The tavern stands at a point from which six thoroughfares radiate: New Kent Road, Walworth Road, Newington Butts, St. George's Road, London Road, and Newington Causeway. It gives its name to a district (heavily damaged by German bombs in 1940) and to two rly. stations, one being a terminus of the Bakerloo tube rly.

**Elephant Apple** (*Feronia elephantum*). Large evergreen tree belonging to the family Rutaceae. A native of Coromandel, it has glossy leaflets and white flowers. The fruit is as large as an apple, with a hard, woody rind containing seeds embedded in pulpy flesh. The pulp is eatable and is made into a jelly; it is also useful in dysentery and diarrhoea. The wood is hard and heavy but not durable. The tree exudes from wounds a gum which forms a constituent of what is known as Indian gum-arabic.

**Elephantiasis** or **BARBADOS LEG.** Disease characterised by chronic inflammation of the fibrous connective tissue, resulting eventually in excessive swelling of the leg, scrotum, arm, or breast, and less frequently other parts. The condition is due to obstruction of the lymph circulation by mechanical and inflammatory causes, the result of infection by a parasite worm, the filaria. The disease, which was recognized in ancient times, probably originated in

Elephant's-foot. Leaves and flowers of the S. African climber

Asia, and has spread thence to Africa, America, India, China, and Japan. Its distribution is influenced by that of mosquitoes, but the exact conditions governing its transmission have not yet been determined.

Elephantiasis frequently begins with high fever, pain in various parts of the body, and swelling of the extremities. The swelling may abate after the first attack, but in subsequent attacks the limb becomes more and more swollen until eventually it may attain an enormous size. Treatment is not very satisfactory. Castellani and Chalmers state that the best results are obtained by keeping the patient in bed and injecting fibrolysin daily for three to six months.

**Elephantinē.** Island in the Nile at Assuan, Upper Egypt. Marking the S. limit of ancient Nile navigation, it contained the Old Kingdom frontier station, Abu, or elephant town, an *entrepôt* of the Sudanese ivory trade. On the W. Nile bank opposite are rock-hewn tombs of Old and Middle Kingdom governors. Under Thothmes III, Rameses II, and other kings, its governor controlled the Assuan granite quarries. During the Persian supremacy there was a Jewish garrison, with a temple of Jehovah here. Aramaic papyri, recovered 1901 and 1906-08, elucidate 5th century life. An interesting object is the nilometer, recently renovated, which dates from the Ptolemaic period.

**Elephant Seal** (*Macrorhinus*). Large species of seal. It is called sea elephant because the nose is

Elephant Seal. A large marine animal found in the Indian and Southern oceans. It is also called the sea elephant

prolonged into a short proboscis in the adult male. Large specimens attain a length of 20 ft., and the girth is about equal to the length. These animals are found only in the Indian and Southern oceans.

**Elephant's-foot,** HOTTENTOT BREAD, or TORTOISE PLANT (*Testudinaria elephantipes*). Perennial climbing herb of the family

Dioscoreaceae. It is a native of S. Africa. The huge rootstock (as much as 4 ft. across) is covered with a corky bark, ultimately cracked into angular protuberances. It contains a store of starch, eaten by the Bushmen. The slender stems climb to a height of 30-40 ft., and bear small heart-shaped leaves and sprays of tiny greenish-yellow flowers.

**Elephant Shrew** (*Macroscelides*, long-legged). Name sometimes given to the jumping shrew, owing to its long and trunk-like nose. They are small African insectivores and have the hind legs so long in proportion to the body that they look rather like miniature kangaroos. They are nocturnal in habit, feed mainly on insects, and proceed by a series of leaps.

**Elephas Primigenius** OR MAMMOTH. One of the extinct elephants, almost identical with modern elephants, but differing in greater development of curly tusks, and in the woolly hair. It was far more widely distributed than the modern elephant, remains being found in America, the bed of the North Sea, the Thames Valley, within the Arctic Circle, and in the frozen earth of N. Russia. See Mammoth.

**Eleusine.** Genus of grasses of the family Gramineae. Natives of warm regions, they are distinguished by the flower spikes being arranged finger-fashion at the top of the stem. As a genus they are of little importance, but

Eleusine, showing the finger-like flowers

*E. coracana* is grown in

Japan and on the Coromandel coast, its large seeds being used as corn.

**Eleusinia** OR ELEUSINIAN MYSTERIES. Festival held in honour of the nature goddess, Demeter, more especially that held at Eleusis in Attica in Sept. each year. Only those who were properly initiated were allowed to take part in the rites. The precise nature of the rites is not known, as they were never divulged in ancient times, though the festival continued till nearly A.D. 400. They were doubtless symbolical of the death of Nature in autumn and its rebirth in spring. See Demeter; Mystery.

**Eleusis.** Ancient city of Attica. Said to have been founded by Triptolemus (q.v.), it stands on

the Bay of Levsina, 12 m. N.W. of Athens, with which it is still connected by the old causeway called the Sacred road. It was the chief seat of the worship of Demeter, in whose temple the Eleusinia were performed. During the Persian Wars this great temple was destroyed, but soon rebuilt, additions being made by Pericles, and later by Demetrius Phalereus. Still further enlarged by the Romans, the city continued intact until it was destroyed by the Goths under Alaric in A.D. 396. Eleusis was the birthplace of the great tragic poet Aeschylus, and after the Peloponnesian War its citadel was seized by the remnants of the Thirty Tyrants (q.v.). Though the site is strewn with ruins, little of the temples but two porches remain, with a sacred well, a council hall, and lesser temple. Eleusis, later Eleusin, is now represented by the village Levsina, lying 15 m. by rly. N.W.

of Athens, chiefly inhabited by people of Albanian stock.

**Eleuthera.** Island of the Bahamas. It is 50 m. N.E. of New Providence, and is separated from Great Abaco by the Providence Channel. Long and very narrow, it is fertile and produces cascarilla, oranges, pineapples, onions, and tomatoes. The capital is Governor's Harbour, with a good, fortified harbour. Area, 235 sq. m. Pop. 6,430.

**Elevation.** In architecture and engineering, a side or end view of an object or representation on a perpendicular plane; also an end or side view of a building or machine drawn to scale without reference to perspective. In astronomy, the angular height above the horizon of a star or other celestial object. In gunnery, the amount of movement of the axis of a gun in a vertical plane, and also an angle formed between the axis of a rifle or gun and a horizontal plane.

**Elevator** (Lat. *elevare*, to lift up). In aeronautics, one of the horizontal tail control surfaces of an aircraft. When moved upwards, the elevators cause the machine to rotate about a lateral axis in such a way that the nose is tilted up-

wards, and the aircraft climbs. When the elevators are lowered there is an opposite effect.

**Elevator.** A grain silo or store equipped with elevating apparatus for taking in and discharging the contents. The name is given also to a lift for materials, goods, or passengers (see Lift). The grain elevator (Fig. 1) contains a number of deep vertical bins, circular, hexagonal, or square in plan, and constructed of steel plates or reinforced concrete; and is equipped with elevating, cleaning, distributing, and discharging apparatus. On arrival the grain is emptied by means of

Elevator. Fig. 1. A lake freighter taking on a cargo from a grain elevator at Duluth, Minnesota, U.S.A.

a bucket or pneumatic elevator into a receiving chamber, whence it passes downwards, through an automatic weigher and a cleaning machine, to a bucket elevator, which carries it to the distributing floor at the top of the building. Here it is received on a system of belt conveyors and is rapidly delivered into one of the bins. These have conical bottoms and are self-emptying. Trucks are run under them and loaded directly, or the grain is transferred to ships by belt conveyors, or through spouts. The largest silos have a capacity of several millions of bushels; will take in 40,000-50,000 bushels an hour, and discharge 100,000 bushels and upwards in the same time.

The type for materials, etc. is in many respects like a conveyor (q.v.). Continuous chain and bucket elevators, either vertical or inclined, are used for handling coal in large boiler houses, delivering the coal into overhead storage bins, from which it flows through chutes to the boiler stokers. Fig. 2 indicates how a double-chain arm elevator can be used to raise bundles and deliver them automatically to a slat conveyor serving a store. A popular form

of machine for raising boxes in tall warehouses is the vertical swing-tray elevator, where the

Elevator. Fig. 2. Double-chain arm elevator used for raising bundles and delivering them to a slat conveyor serving a store

carriers are freely pivoted to two strands of Ewart chain. This type of package elevator is much used with gravity roller conveyors in warehouses and bottling stores.

**Elf.** Small being common to the folklore of most countries of northern Europe. Grimm says that an elf comes as much short of human size as a giant towers above it. The white elves are well formed and symmetrical, the black ugly and misshapen. The latter mostly work underground at their forges, and, like their white brethren on the earth's surface, take pleasure in teasing mankind. If left undisturbed they maintain peace with men and delight in doing them service; but if interfered with retaliate with mischief.

Elves were generally credited with wisdom and sometimes with divination. A common characteristic of the elf was his power of becoming invisible, frequently by means of a cloak or cap; thus, Siegfried in the Nibelungs' Song has an invisible cap which he obtains from Alberich, the elf-king. In most stories elves are peculiar to the earth and underground, and are scarcely distinguishable from the forge-working

dwarfs and gnomes of the mountains; while in others they are associated with light and flowers, and blend in the more general term of fays and fairies. There have been attempts to link the elf tradition with a primitive northern people of small stature.

Flint arrow-heads were called elf-arrows or elf-bolts from an idea that they were weapons of these little people. They are worn as amulets (ancient Etruria, Italy),

and reproduced for sale (Mecca). In Ireland water poured over them is given to cattle. Other things associated with them were elf-locks, hair matted together by them in mischief, or as they wore it; elf-child, a changeling; elf-knot, the hole in a piece of wood from which a knot has fallen, being the hole through which an elf can pass; night-elf, the nightmare; elf-light, will-o'-the-wisp; elf-lay, a fairy song. See Folklore.

## ELGAR: GREAT BRITISH COMPOSER

Basil Maine, Author of *Life and Works of Elgar*

*The life of the outstanding British composer of the early 20th century, who became also a notable figure in European music, told by his friend and biographer*

Edward William Elgar was born at Broadheath, a village near Worcester, on June 2, 1857. His father, W. H. Elgar, was a native of Dover, who settled in Worcester in 1841 and established a music

shop there; his mother was a native of the West Country, her maiden name being Anne Greening. As a boy, Elgar was surrounded by music and musical talk and activities. His father was organist of S. George's (Roman Catholic) church, Worcester, and as a violinist played in the orchestra at the Three Choirs' Festivals. Edward sometimes took duty for his father at the organ. He learnt to play the violin and the bassoon and was an active member of the Worcester glee club. For a time he worked in a solicitor's office, but all the time his mind was on music and every moment he could snatch was devoted to playing or to composition. Like his father, he was admitted to a place among the violins in the festival orchestra.

### Bandmaster and Composer

At the age of 20, Elgar went to London to have violin lessons. He was appointed bandmaster at the Worcester county asylum and in this capacity gained knowledge of rudimentary orchestration. The year 1883 brought him before the public as a composer; an intermezzo which he had written was performed at an orchestral concert in Birmingham. During these impressionable years there came his way the music of Emanuel Bach, and of those almost forgotten composers, Schobert and Kozeluch; also examples of Tudor church music, the masses of Haydn

and Mozart, Meyerbeer, the operas of a travelling company's repertory, together with Shakespeare and Voltaire. These impressions were assimilated only to give the composer's individuality a keener

edge; for, it can be confidently said, no composer's music is more immediately recognizable than Elgar's. Yet over half his life had passed before recognition came. Lack of encouragement made him diffident. He was approaching 40 before he became completely sure of himself. His marriage, in 1889,

to Caroline Alice Roberts, was a factor in this gradual self-assurance. Until her death in 1920, his wife played the part of encouraging companion. Her influence can be judged from the fact that Elgar wrote no important work after her death.

The completion of the choral and orchestral work, *King Olaf* (1896), served to give Elgar confidence in his powers, but it was not until the orchestral work known as *Enigma Variations*, was produced in 1899 with Hans Richter as conductor, that the wider public acclaimed his genius. Assurance was made doubly sure by the production in 1900 of the great oratorio, *The Dream of Gerontius*. This was soon given in Germany, and the event was a landmark not only in Elgar's career but also in English music; Elgar had joined English music to the main European stream. After *Gerontius*, there followed the oratorios, *The Apostles* (1903) and *The Kingdom* (1906), the first symphony (1908), violin concerto (1910), second symphony (1911), and the sym-

Sir Edward Elgar, British composer

phonic study, *Falstaff* (1913); and in each of these works, not to mention the introduction and allegro for strings and the cello concerto, Elgar establishes his claim to be ranked with the finest and most imaginative writers for orchestra.

When Elgar was at length accepted at his true worth (largely as a result of tributes from foreign musicians), honours came thick and fast. In 1904 an Elgar Festival was given at Covent Garden; the same year he was knighted; a year later Oxford made him an honorary doctor of music (he had already received an honorary degree from Cambridge), and he was appointed professor of music at Birmingham. During the war years beginning 1914, he, like other creative artists, was in a chastened mood. He turned to chamber music and also to work of a topical nature, such as *Carillon*, *Polonia*, and choral settings of verse by Laurence Binyon, called *The Spirit of England*. The 'cello concerto (1919) speaks of the sorrow which fills an artistic soul in time of war. In 1924 Elgar was appointed Master of the King's Music.

#### Unfinished Symphony and Opera

After 1920 Elgar wrote no major work, although his free orchestrations of a fantasia and fugue by Bach and an overture by Handel, and the nursery suite for orchestra give abundant evidence of the master hand. His 75th birthday was marked by a festival arranged by the B.B.C. It was then that the public heard that the B.B.C. had commissioned a third symphony from Elgar, but this work was interrupted by a painful illness, and on Feb. 23, 1934, he died, leaving unfinished not only his symphony, but also an opera to be called *The Spanish Lady*, based on Ben Jonson's play, *The Devil is an Ass*.

There is no insularity in Elgar's music. The liberal distribution of tastes and attractions during his youth was evidence of his mind's great range. Not that his music was unconditioned by national environment. In that respect he is in the company of Beethoven, Brahms, and Sibelius. But like these, he was nationalist by grace, not by adoption of folk-song. Melodies that once were folk-music but are no longer—these he eschewed; especially in compositions which were deliberately patriotic in motive. Instead Elgar wrote melodies of his own, one of which (*Land of Hope and Glory*)

became a "folk-song" in his own lifetime.

Elgar's was always a symphonic way of thinking. The spontaneity and nervous energy of his most characteristic music demand that the orchestra should have a free hand. In the oratorios and cantatas there are occasional passages where the purely musical part of Elgar's mind, with its continual aspiration towards the larger freedom of symphonic thought, appears to be fretting under the burden of the text. Among the finest symphonic composers of history, Elgar's name shines because of his peculiar genius for orchestral writing, which, incidentally, helped to raise the standard of orchestral playing in England. Elgar was loved by English orchestral players. The memory of early days when he was himself a bandsman filled him with a sympathetic appreciation of their work. He was one of them. Unsparringly he devoted himself to making his music understood by them. They have proved themselves worthy. English orchestras do indeed know their Elgar, the idiom of his phrase, the curve of his eloquence, the secret of bowing his ecstatic melody and of breathing his rich harmony. *Consult* *Life and Works*, B. Maine, 1933; Elgar, W. H. Reed, 1936.

**Elgin.** Royal and mun. burgh and co. town of Morayshire, Scotland. It is 80 m. by rly. N.W. of

Elgin, Scotland. The western towers of the ruined cathedral

Aberdeen; Lossiemouth, its port, is 5 m. to the N., with its own railway station. Elgin has ruins of a beautiful cathedral, founded in 1224, burnt down in 1270, rebuilt, and again destroyed by fire in 1390 by the Wolf of

Badenoch. Restored to greater magnificence, it was wrecked by the fall of the central tower, 1711.

Remains exist of the bishop's palace, a royal castle, and monasteries of Blackfriars and Greyfriars; the Greyfriars chapel was restored by the third marquess of Bute. Woollen manufacture, iron-founding, and tanning are industries. A 40-acre park was presented by (Sir) George Cooper in 1903. Mkt. day, Fri. Pop. 10,571.

**Elgin.** City of Illinois, U.S.A., in Kane co. On the Fox river, which supplies power for the industrial establishments, it is 36 m. W.N.W. of Chicago by rly. It has a reputation for watches and butter, though production of the latter has declined in favour of milk-processing. Manufactures include bottling equipment, ovens, sewing implements, shoes, and thread. The academy of fine arts has a notable collection of American paintings. Settled in 1835, was granted a city charter in 1854. Pop. 38,333.

**Elgin, EARL OF.** Scottish title held by the family of Bruce since 1633. Sir Edward Bruce, master of the rolls under James I, was made a baron in 1601, and his son Thomas was made earl of Elgin and later an English baron. The 2nd earl was made earl of Aylesbury in 1663. In 1746 the direct line failed, and there was a division of the titles, the earldom of Elgin passing to Charles Bruce, 9th earl of Kincardine, whose successors have borne the double title. Thomas Bruce, 7th earl of Elgin and 11th earl of Kincardine, a general in the army and ambassador at Brussels, Berlin, and Constantinople, is remembered as the collector of the *Elgin Marbles* (*q.v.*). The 10th earl (b. 1881) succeeded his father in 1917. The family seat is Broomhall, Fife, the earl's son is known as Lord Bruce, and the earl sits in the house of lords by virtue of a barony created in 1849. *Pron.* Elg-in.

**Elgin, JAMES BRUCE, 8TH EARL OF** (1811-63). British diplomatist. Born in London, July 20, 1811, son of the 7th earl, whom he succeeded in 1841, he was governor of Jamaica 1842-46, and governor-general of Canada 1846-54. He was raised to the British peerage in 1849. In 1857 he went as envoy

8th Earl of Elgin, British diplomatist

to China to demand reparation for the seizure of the British Iorcha Arrow, and on the way out diverted his troops to assist Lord Canning in the Indian Mutiny. He negotiated the treatise of Tientsin and Yeddo in 1858, and in China again in 1860 secured the ratification of the treaty of Tientsin. In 1861 he was appointed viceroy of India, where he died, at Dharmasala, Nov. 20, 1863. *Consult* his Letters and Journals, 1872; Lives, J. G. Bourinot, 1905; G. M. Wrong, 1905; W. P. M. Kennedy, 1926; J. L. Morison, 1928.

**Elgin, VICTOR ALEXANDER BRUCE, 9TH EARL OF** (1849–1917). British statesman. Born at Montreal, May 16, 1849, when his father was governor-general of Canada, he was educated at Glenalmond, Eton, and Balliol College, Oxford. In 1863 he succeeded to his father's estates and titles, these including the earldom of Kincardine. With Gladstone he became a Home Ruler, and in the government of 1886 was treasurer of the household and first commissioner of works. During the years 1894–99 he was viceroy of India. In 1902 he was chairman of the royal commission appointed to inquire into the preparations for the South African War, and later of the one that reported on the ecclesiastical crisis in Scotland, caused by the judgement of the house of lords on the property of the Free Church. In 1905 Campbell-Bannerman made Elgin colonial secretary, but he did not retain this office when Asquith became premier in 1908, refusing then the marquessate offered him; his cautious policy and freedom from partisanship had not been altogether acceptable to his party. He died at Broomhall, Fife, Jan. 18, 1917.

**Elgin Marbles.** Collection of sculptures brought from Greece by the 7th earl of Elgin, while ambassador to the Porte. Keenly interested in the remains of ancient art in Athens and other Greek towns, his first intention was to have accurate drawings of them made, but seeing that they were fast going to ruin, he obtained the Porte's sanction to remove various relics. These consisted largely of sculp-

tures by Pheidias and other great artists from the Parthenon and the temple of Nikē Apteros (Wingless Victory) in Athens. Despite enormous difficulties, including the wreck of the ship conveying the precious cargo to England, the Elgin Marbles (as they were afterwards collectively called) were brought to London in 1806. Added to in later years up to 1812, they were finally acquired for the British nation in 1816 for £35,000, less than half of the sum (£74,000) Lord Elgin had paid to preserve them from total destruction, and are now in the galleries of the British Museum. Lord Elgin was accused by Byron and others of

Elgin Marbles. Two views of the north frieze of the Parthenon, now in the British Museum

vandalism, and even dishonesty, but the select committee of the house of commons appointed to investigate the whole subject entirely exonerated him. During the Second Great War the exhibits were stored in Aldwych station, London. *See* art illus. p. 661.

**Elgon.** Extinct volcano, 14,140 ft. high. It stands on the frontiers of Uganda and Kenya Colony, 60 m. N.E. of the Victoria Nyanza. The rivers on the W. side drain into Lake Kioga, those on the E. into the Victoria Nyanza. The forest (about 50 sq. m.) on Mount Elgon is little known.

**El Greco.** Name by which the painter Domenico Theotocopuli (*q.v.*) is best known.

**Eli.** Judge and priest of Israel in the later period of the Judges. Through Samuel, who was in his service as a boy attendant, God indicated his anger at the misdeeds

of Eli's sons. When the news came that the Ark of the Covenant had been taken by the Philistines, and both his sons killed, Eli fell back and broke his neck.

**Elia.** Name taken by Charles Lamb. It was that of a clerk in the South Sea House, and was first assumed by Lamb when in 1820 he began to contribute essays to *The London Magazine*. *See* Essays of Elia; Lamb, Charles.

**Elibank, VISCOUNT.** Scottish title. A barony of the same name has been held since 1643 by the family of Murray. Patrick Murray, a person of importance in Selkirkshire, where Elibank is situated, and on the Scottish borders generally, was made a baronet in 1628, and a baron by Charles I in 1643. His title passed to his son Patrick in 1650, and then down a line of descendants, of whom George, the 6th baron, became an admiral. In 1871 Montolieu Fox Oliphant (1840–1927) became 10th baron, and in 1911 he was made a viscount of the U.K. His eldest son, Alexander, was made Lord Murray of Elibank in 1912, after serving as chief whip of the Liberal government (*see* Murray).

Of Viscount Elibank's younger sons, Gideon (b. 1877) succeeded as 2nd viscount in 1927. He was a distinguished administrator in New Guinea and South Africa, and wrote a volume of reminiscences, *A Man's Life*, 1933.

**Elie.** Police burgh, parish, and holiday resort of Fife, Scotland. It is on the N. side of the Firth of Forth, 10 m. S. of St. Andrews and 45 m. N.E. of Edinburgh by railway. It includes Earlsferry, a royal burgh. It has a harbour and pier, and is a coastguard station with a flashing light on Elieness. There are fine golf links. Pop. of parish, 1,251.

**Elihu.** The last of Job's comforters, as described in the Book of Job, chaps. 32–37. A young man, he reproved alike Job for being righteous in his own eyes, and the three older comforters for condemning Job without answering him. The burden of Elihu's speech is a justification of the ways of God. His words and character may have been added to the book by a later writer.

**Elijah.** Hebrew prophet. A native of Gilead (1 Kings 17), he lived in the days of Ahab. He appears to have led a kind of hermit life in the mountains, emerging only at intervals to denounce Ahab and attack the priests of Baal. On Mount Carmel he challenged

the priests of Baal to a test of the rival religions by calling down fire from heaven, after which he had to flee from the wrath of Queen Jezebel to Beersheba, where he seems to have wandered about the desert for six weeks.

When Ahaziah succeeded Ahab, Elijah warned him that he would die as a result of an accident that he had suffered. Towards the close of Jehosaphat's reign Elijah was still living, for he sent a letter to Jehoram, the king's son. When the end came, we are told that Elijah passed in a chariot of fire into the heavens. Jewish tradition long held that he would reappear before the coming of the Messiah, and the chair of Elijah is still set ready at the Passover meal.

Legend points out Elijah as the founder of the Carmelite Order, and in the Greek Church he is regarded as the patron saint of the mountains. He appears to have had some connexion with the mysterious religious communities known as the "Sons of the Prophets," of which there were a large number in Palestine in his period. In the N.T. he is referred to as Elias. His mantle and power fell to Elisha.

**Elijah.** Oratorio by Mendelssohn, set to texts from the O.T. First performed at Birmingham, Aug. 26, 1846, it was an immediate success and soon took its place after Handel's Messiah in popular favour in England. After revision it received its first German performance at Hamburg, Oct. 7, 1847. A stage version was given by the Moody-Manners Opera at Liverpool in 1912. An unusual feature is that the name part is for bass. Recitative, aria, duet, trio, quartet, and chorus are employed. The work is of great dramatic power, e.g. in the choral appeals to Baal, the declamation for soprano at the beginning of the second part; and such arias as Lord God of Abraham (bass) and O Rest in the Lord (alto) are often sung apart from the oratorio.

**Elim Movement.** A British evangelical sect which bears the title Elim Foursquare Gospel Alliance. It was founded in co. Monaghan, Ireland, by Pastor George Jeffreys, head of the organization until 1939. The name Elim is taken from the last verse of Exodus 15, where it is recorded that the Israelites encamped in the wilderness and refreshed themselves by the wells of water in the shade of a grove of palm trees.

Elim preaches the literal truth of the Scriptures, the efficacy of

divine healing through the laying-on of hands, and the imminence of Christ's second coming. It emphasises the close personal relationship between Christ and the sinner.

The Alliance is governed by a conference, which meets annually, consisting of representatives (ministers and laymen) from the churches. There are churches in London and the provinces, and the organization maintains home and overseas missions. Every Easter Monday it holds a festival in the Albert Hall, London, where new converts are baptized by total immersion. The headquarters are at 20, Clarence Avenue, Clapham Park, London, S.W.4.

**Eliot, CHARLES WILLIAM** (1834-1926), American educationist. Born at Boston, March 20, 1834, he was educated there and at Harvard. In 1854 he became a mathematical tutor at Harvard, and later assistant professor of mathematics and chemistry in the Lawrence scientific school. After studying in Europe he was appointed in 1865 professor of chemistry in the Massachusetts Institute of Technology. In 1869

Charles W. Eliot,  
American  
educationist

he was chosen president of Harvard, being made president emeritus on his retirement in 1909.

At Harvard Eliot did great work. He reconstructed the law and medical schools and introduced the elective system into the curriculum. The example of these achievements helped to raise the standard of academic education throughout the U.S.A. He was not only a great university administrator, but long exercised an unrivalled authority as an adviser on national questions. He twice declined the ambassadorship to Great Britain. His annual reports as president of Harvard were notable publications, and he also wrote Educational Reform, 1893; Four American Leaders, 1906; The Road Towards Peace, 1915. He died Aug. 23, 1926.

**Eliot, GEORGE** (1819-80). Pen-name of Mary Ann, or Marian, Evans, English novelist. She was

born at Arbury Farm, near Nuneaton, Nov. 22, 1819. The daughter of an estate agent, living for us in

George Eliot,  
English novelist

After F. D'Albert Durade

Adam Bede and in Caleb Garth (of Middlemarch), she early became wise in all that pertains to country life in Warwickshire, of which she has given us so intimate a picture. Her mother's death, and the marriage of her elder sister, Christiana (also drawn in Middlemarch), threw on her shoulders at 16 the responsibility of her father's household.

Here she was surrounded by the influences of evangelical revivalism, deeply confirmed by her aunt Elizabeth, the original of Dinah Morris (in Adam Bede).

A move to Coventry in 1841 brought her into a more literary atmosphere. A student of German and Italian, Latin and Greek, and music, she now mingled with those for whom books were their most treasured companions and philosophy the chief staple of daily talk. Though too sensible and affectionate to risk permanently estranging her father by any formal and visible break with the religious observances of her childhood, she turned her mind to such tasks as a translation of Strauss's Life of Jesus, and in her heart gave up orthodox faith for ever.

#### Entry into Journalism

When in 1849 the old man died, it was natural that she should seek further freedom of intellect in London among the men and women then chiefly inspired by the materialistic agnosticism of Herbert Spencer. She was soon assistant-editor of the Westminster Review, where she published weighty articles on ethics, through which she met George Henry Lewes. The union between them, life-long though not tied by legal marriage, was not lightly entered upon. George Eliot's preoccupation with the problems of married life, her continual insistence upon the binding nature of promises between husband and wife, are pathetic testimony to her uneasiness in a position that could so easily be criticised from her own standard of duty. But as she had entered into it with deliberation, she never admitted disloyalty to her own conscience; and from a literary point of view, the consequences were an unmixed gain.

It was Lewes who first discovered her genius for fiction.

Instantly recognizing a new force in literature, he encouraged her diffident aspirations, and himself carried out all the negotiations with editors and publishers, which resulted in the anonymous appearance of three stories in Blackwood's Magazine, published in 1858 as the well-known Scenes of Clerical Life. Immediately popular, they were followed by Adam Bede, 1859; The Mill on the Floss, 1860; and Silas Marner, 1861. Henceforth she lived happily and strenuously among the thinkers of the day, a professional woman of letters, whose work enjoyed much critical appreciation, popularity, and influence among thoughtful

lesser degree her later novels, reveal the dangers of undigested analysis in imaginative writing; she was weighted with anxiety about the soul of mankind. But because she was before all things a great artist and a warm-hearted and sympathetic woman, she was able to create an immortal gallery of human beings, whose joys and sorrows can never lose their hold on the affections. Her excellent professional training secured fine fruit for her varied powers of ordered memory, acute observation, and dramatic instinct. The earlier novels reach right into the heart of things because they are built on the most intimate experiences

of youth, with spontaneous humour and deep emotion. If the style, the plot, and the psychology of what followed yield somewhat to affected pedantry, we have, at least in Middlemarch, many a revelation in emotional problems.

Like her great feminine predecessors she was realistic and paradoxical; but what Charlotte Brontë first bitterly proclaimed on a few passionate topics became with George Eliot a definite philosophy universally applied. She insisted that women should dare to think for themselves, establish their own moral standards, follow their own conscience, and even demand man's acquiescence. No writer of fiction has illustrated with greater power the ultimate ethical truths of life, the tragic pathos of continual backsliding, and the eternal significance of the choice between good and evil. Her passionate faith, indeed, called for more than reason could give to doubt. Her message was not final. But she left an unrivalled revelation of much that our forefathers were feeling, thinking, and striving for: a living picture of Victorian domesticity, the farmer, the tradesman, and their womenfolk.

George Eliot. Arbury Farm, Nuneaton, where George Eliot (Mary Ann Evans) was born, Nov. 22, 1819

middle-class readers. Her later output embraced *Romola*, 1863, a painstaking reconstruction of the past; *Felix Holt*, the Radical, 1866, a political treatise; *Middlemarch*, 1871-72, a problem novel with three loosely-knit plots; *Daniel Deronda*, 1876, a study of an alien race; besides *The Spanish Gypsy* and *The Legend of Jubal* in verse, and the somewhat ponderous collection of short essays entitled *Impressions of Theophrastus Such*. After Lewes's death in 1878, she married in 1880 John W. Cross, afterwards her biographer, but died Dec. 22 that year.

#### George Eliot's Sense of Duty

It was the grafting of a somewhat arid philosophy upon the Calvinism of early years that gave distinction and popularity to George Eliot's work. Always profoundly religious, and mastered at all times by an uncomfortably strict sense of duty, she met the questionings of the mid-Victorians with a rare and illuminating sincerity, and awoke echoes in many a young, ardent spirit newly alive to the serious mysteries of life.

She was, in fact, more receptive than original or independent; her poems, and Theophrastus, and in

**Eliot, Sir John** (1592-1632). English politician. Born at Port Eliot, Cornwall, and educated at Exeter College, Oxford, he was knighted in 1618, and in 1619 was appointed vice-admiral of Devon as a supporter of the duke of Buck-

Sir John Eliot, English politician. From a painting in the possession of the Earl of St. Germans

ingham. First elected M.P. in 1614, he made an attack on Buckingham in 1626 and was sent to the Tower. On release he was a principal promoter of the Petition of Right, 1628. On March 2, 1629, Eliot drafted and Holles read a protest against unauthorised taxation, whilst the Speaker was forcibly held down in his chair. Two days later Eliot was sent to the Tower. He remained there until his death, Nov. 27, 1632. He is regarded as a martyr for parliamentary freedom. Consult Life, J. Forster, 1864.

**Eliot, John** (1604-90). English missionary to American Indians. He was born at Widford, Herts, and educated at Jesus College, Cambridge. In 1631 he went to America and in 1646 became a Protestant missionary to the Indians in Massachusetts. His headquarters were at Natick; and he died at Roxbury, May 21, 1690. Eliot translated the Bible into the native dialects, in addition to preparing a grammar and catechism. He assisted in the preparation of the famous Bay Psalm Book (*q.v.*).

**Eliot, Thomas Stearns** (b. 1888). An American-born British poet. He was born Sept. 26, 1888, at St. Louis, Mo., and educated at Harvard, the Sorbonne, and Merton College, Oxford, a cosmopolitan training which is reflected in his poetry. After 1913 he lived mainly in London where, after a short time as a bank clerk, he taught and lectured. His first volume of poems, *Prufrock and Other Observations*, was published in 1917, and contained work dating from 1909. It reflected mainly the New England period of his life and included four acid comments on Boston society written in 1915; the earliest poem he

John Eliot, English missionary

allowed to be printed, *Conversation Galante*, written at 19; and three of his most characteristic poems, *Portrait of a Lady*, *The Love Song of J. Alfred Prufrock*, and *La Figlia che Piange*, written—in that order—between 21 and 23.

Eliot's friendship with Ezra Pound profoundly influenced his technique. Together the two poets read and studied the same sources, interchanged ideas, and made similar experiments in versification; and his next volume, *Poems*, 1920, showed a complete contrast with his earlier work. It contained a series of biting satires, of which *The Hippopotamus* (1917) was the first, and four poems in French. In the same year he published his first volume of criticism, *The Sacred Wood*. In one of the essays, *Tradition and the Individual Talent* (1917), he explained his theory of poetry; and in others, notably those on the Elizabethans, gave clues to the influences at work on his own writing.

#### The Waste Land

The publication of *The Waste Land* in 1922 marked Eliot's emergence as a major poet. This poem of 433 lines, with its fifty annotated references and other literary and historical allusions, its quotations in five different languages (including Sanskrit), its variety of rhythm, and its elliptical phrasing, is a comment on modern civilization. Its apparent obscurity and unquestionable difficulty ensured that its original impact was on a small literary circle; but it gradually won acceptance and exercised a decisive influence on younger poets for twenty years. In 1922 also Eliot founded and edited *The Criterion*, a literary review, which until its cessation in 1939 maintained an unquestioned supremacy among critical magazines. The new venture was published by the firm of Faber, of which Eliot became a director.

In 1925 he published his first volume of collected poems; in 1927 he became a naturalised British subject and about this period joined the Church of England. In the preface to his second volume of essays, *For Lancelot Andrewes* (1928), he described his general point of view as "classicism in literature, royalist in politics, and Anglo-Catholic in religion." His next volume, *Ash Wednesday* (1930), a sequence of religious poems, announced what was thereafter to be the main preoccupation of his thought and work—a mysticism which found its culmination in *Four Quartets* (1944) comprising

*Burnt Norton*, *East Coker*, *The Dry Salvages*, and *Little Gidding*, which had been separately issued between 1936 and 1942.

Throughout the 1930s the religious issue dominated Eliot's work, whether in a topical pamphlet like *Thoughts after Lambeth* (1931); in a pageant play, *The Rock*, written for performance at Sadler's Wells Theatre in 1934 on behalf of the Forty-Five Churches Fund of the Diocese of London; in a play on Becket, *Murder in the*

T. S. Eliot, British poet

*Cathedral*, which was performed in Canterbury Cathedral in 1935 and subsequently had an outstanding success in London, or in a series of lectures, *The Idea of a Christian Society*, delivered in 1939 at the invitation of the master and fellows of Corpus Christi College, Cambridge. Eliot's dramatic work was heralded by the publication in 1932 of *Sweeney Agonistes*, described as "fragments of an Aristophanic melodrama"; *Murder in the Cathedral* was followed by *The Family Reunion*, 1939; *The Cocktail Party*, 1949.

During the 1930s academic recognition came to him. In 1932 he returned to the U.S.A. as Charles Eliot Norton professor of poetry for 1932-33 in his old university of Harvard, delivering the lectures which were subsequently published as *The Use of Poetry and the Use of Criticism*. Awarded hon. Litt.D. by several universities, including Oxford and Cambridge, he received in 1948 the O.M. and the Nobel prize for literature.

Eliot remains a unique phenomenon in English letters, with imitators rather than successors. It is difficult to analyse the nature of the poetry which, a quarter of a century after the publication of

*The Waste Land*, many readers still find obscure; but it may be epitomised by saying that, in endeavouring to communicate his vision to his readers, he relies not on a subjective expression of his own emotions but on finding an objective standard of reference—which he calls "the objective correlative"—which will evoke the same response from both writer and readers. This objective correlative may be an historical incident, a person, a phrase from another writer, a classical allusion, a reference to an anthropological treatise, the chorus of a popular song, a piece of popular devotion. Many of his poems have thus a superficial appearance of plagiarism or parody; and nearly all contain recondite literary allusions which present problems to those less erudite than himself.

#### Hugh Ross Williamson

**Elis.** Country on the W. coast of Peloponnesus, Greece. Its chief city was Elis, on the Peneus, while another city, Pylos, was the seat of the kingdom of the Homeric hero Nestor. In Elis was the district of Pisa, where the great Olympic games were held every four years. It forms the modern dept. of Elis, the capital of which is Pyrgos. Pop. 148,554.

**Elisabeth.** Mother of John the Baptist, whom she bore in old age (Luke 1). She was the wife of Zacharias, a priest in the Temple, and cousin of the Virgin Mary.

**Elisabethville.** Town in the extreme S. of the Belgian Congo and headquarters of the prov. of Elisabethville. It is 2,305 m. N.N.E. of Cape Town and 292 m. S.E. of Bukama, on the Lualaba portion of the Congo river. The *Étoile du Congo* mine is 8 m. distant, and there are other rich copper deposits in the neighbourhood. European pop. 3,432.

**Elisha.** Son of Shaphat, and companion of the prophet Elijah, whose successor he became (2 Kings 2). At the translation of Elijah he received his mantle as a sign of office. He flourished in the reigns of Jehoram, Jehu, Jehoahaz and Joash, and had considerable influence in public affairs.

**Elixir** (Arab. *el iksir*, the philosopher's stone). In pharmacy, a preparation containing alcohol, flavouring agents, sometimes active ingredients like senna. It is a tincture of various substances held together by alcohol. In alchemy, the elixir of life (*elixir vitae*) was believed to be a substance which would prolong indefinitely the life of anyone who consumed it.

**Elizabeth.** City of New Jersey, U.S.A., the co. seat of Union co. It is near the mouth of Elizabeth river on Staten Island Sound and Newark Bay, 14 m. by rly. S.W. of New York. It makes rly. equipment, sewing machines, motor cars, hardware, and tools, and has oil refineries, chemical works, and shipyards. In 1664 colonists from Long Island made it the first English settlement in New Jersey. In 1747 the College of New Jersey (forerunner of Princeton) was opened. Elizabeth became a borough in 1740, a town in 1796, and a city in 1855. Pop. 109,912.

**Elizabeth.** Feminine Christian name. It originated in a Hebrew word, Elisheba, meaning God hath sworn, and became very popular throughout the Christian world.

It has various forms, one of which is Isabella, and is common in eastern Europe as well as in the west. Eliza, Elsie, and in Scotland Elspeth are among its abbreviations.

**Elizabeth** (1207-31). Hungarian princess and saint. Daughter of Andreas II of Hungary, she was born at Pressburg (Bratislava) and gave herself to the ascetic life. Married in 1221 to Louis IV of Thuringia, she was driven from the court on his death in 1227. Renouncing the world, she lived at Marburg under the influence of Conrad of Marburg, and subjected herself to the severest penances and self-denial. She died there on Nov. 19, 1231, and was canonised in 1235, after many miracles reported from her tomb. Nov. 19 is her festival. *Consult* Lives, W. Canton, 1922; F. J. von Weinrich, 1933.

## ELIZABETH: HER REIGN AND ITS GLORIES

A. D. Innes, *Author of England Under the Tudors*

*This biography is one of the most important of the series on the sovereigns of England and Scotland. Further information is under England: History; Mary Queen of Scots; Armada. See also biographies of Burghley; Drake; Leicester; Philip II, etc.*

Elizabeth was the daughter of Henry VIII and Anne Boleyn, whom he married before the English law courts had pronounced his earlier marriage with Catherine of Aragon invalid. Elizabeth was born on Sept. 7, 1533; Catherine did not die till 1536. According to Roman Catholics, therefore, Elizabeth was not born in wedlock. In 1536 Anne was executed, after a pronouncement of the courts that her marriage had not been valid. The title under which Elizabeth succeeded her half-sister Mary in 1558 was conveyed by the will of Henry VIII. The actual legitimate heir to the throne was her cousin Mary Queen of Scots, the granddaughter of Henry's elder sister, Margaret.

Elizabeth's girlhood was hard and loveless; she lived in an atmosphere of suspicion, in which she learnt that duplicity was the condition of self-preservation. During Mary's reign she was charged with complicity in Wyatt's rebellion, though it was found impossible to bring the accusation home to her. Throughout the reign she was kept under suspicious surveillance, but successfully evaded definite profession of her sister's religion. It was imposed upon her by her position that she should take her stand as a Protestant. Her own wisdom taught her that her strength must depend upon the solid support of her Protestant subjects.

From her accession in 1558 Elizabeth was herself the ruler of her

country, though she chose and trusted her counsellors with profound insight. Public opinion demanded that she should marry, and secure an undisputed succession. She herself never had the slightest intention of marrying, but understood to the full the diplomatic use that might be made of the fact that it was open for her to choose a husband. For five-and-twenty years

she played with marriage proposals, the most notable of her suitors being Philip of Spain, whose offer she declined in the first months of her reign; the Austrian Archduke Charles; Henry of Anjou, afterwards Henry III of France, her junior by eleven years; and finally his younger brother, Francis. Fears were at one time entertained that she might marry her undesirable favourite, Robert Dudley, whom she made earl of Leicester. It was not till she reached the age of fifty that the theory of her probable marriage was finally abandoned.

The antagonism between Elizabeth and Philip of Spain was the controlling factor in her policy. Elizabeth saw that Philip's hands were tied; if he struck at her successfully the succession of Mary Stuart to the English throne would be the inevitable result, and Mary's association with France was so intimate that her accession would almost inevitably mean the close alliance of England and France, to the great inconvenience of Philip. Hence for five-and-twenty years a positive rupture between England and Spain seemed always imminent, but was always postponed, which was precisely what Elizabeth wanted.

### Elizabeth and Mary Stuart

England had been weakened by years of misrule, and Elizabeth did not mean to fight until England was strong enough to make sure of winning. Year after year, though she carried on and encouraged what was, in fact, a covert war against Spain, she abstained always from the last provocation which would have compelled Philip to open war. Primarily because the life of Mary Stuart was an obstacle to Philip, she kept Mary Stuart alive and a prisoner, in spite of the personal danger to herself. But Elizabeth's hand was at last forced; in 1586 she was obliged to give open official support to the United Provinces of the Netherlands and sanctioned the execution of Mary Stuart.

The result was the coming of the Spanish Armada, and its annihilation in 1588. After its destruction maritime war between England and Spain continued through the remaining ten years of Philip's life and the five years by which Elizabeth outlived him. For the old queen those years were embittered by the tragedy of the young earl of Essex, Robert Devereux, to whom she became devotedly attached, but whose arrogant folly led him into treasonable acts, from the consequences of which the queen could not save him,

*Elizabeth*

From an engraving by W. Rogers in the collection of H.M. the King

Queen Elizabeth

*From the painting by F. Zuccaro*

To the last Elizabeth persisted in her refusal to make any pronouncement as to her successor on the throne. Besides King James of Scotland, the son of Mary Stuart, there were various living descendants of the two sisters of Henry VIII, all of them Protestants, on whose behalf more or less plausible claims might be put forward. There was also a possible claimant in the person of a daughter of Philip of Spain, who claimed descent from John of Gaunt. But for Elizabeth to have nominated an heir at any time would have been an inducement to her own assassination. Only at the point of death, at Richmond, Mar. 24, 1603, was she said to have approved by a sign the name of the Scottish king.

No reign in our annals is more glorious than that of Elizabeth. Its extraordinary political success was due in great part to her own extraordinary political intelligence and to the peculiarities of her character. Between good fortune and her own ingenuity she was invariably provided with some way of escape from every complication which she herself wove, or which was woven about her. In the last resort she deliberately utilised assumed feminine weaknesses as justifying the unjustifiable in her conduct. She made full use of the shrewdest brains, the strongest hands, and the stoutest hearts that could be called into her service; and she never misjudged her servants. But ever she went her own way—devious always, not seldom false, not often generous, but never without knowing exactly what she was doing. And exactly what she was doing was what no other living man or woman, including her most intimate advisers, ever knew. She outwitted every states-

man in Europe; none outwitted her. And she raised England from the degradation into which it had fallen under her immediate predecessors to the highest rank among nations.

But it is not only Elizabeth's political success that gives to the Elizabethan era a unique place in history. It was the era in which England sprang suddenly into the position of maritime supremacy, and an era also of such poetic achievement as could be paralleled only by Athens in the past, and once again by England herself early in the 19th century.

In Elizabeth's reign the English seamen came to their own. They acquired the skill in ocean navigation which gave them a complete ascendancy over the earlier ocean sailors, Spanish and Portuguese. Frobisher and Davis explored the far northern shores of the recently discovered American continent and penetrated deep into the Arctic seas. John Hawkins and many another sea-dog of Devon made the voyage to the Spanish main,

and learnt to make little account of fighting with Spanish ships of thrice their tonnage. Save the Spaniards and Portuguese the Englishman, John Oxenham, was the first European to lay keel in the Pacific. Francis Drake was the first captain who sailed the whole way round the world, since the Portuguese Magellan died before his voyage was completed. Before Elizabeth was dead, Cavendish, too, had sailed round the world. The Englishmen who destroyed the Armada first made it manifest that the ship of war should be herself a weapon of war, with sailors, not soldiers, to fight her; that seamanship is the grand factor in naval warfare, and is the inheritance of Englishmen more than of any other people. The Elizabethan seamen laid the foundations both of the commercial and of the naval supremacy of England, though neither was quite decisively established until nearly another century had passed.

No less astonishing was the literary development of the latter

Queen Elizabeth. The last scene in the royal palace of Sheen, Richmond, where the queen passed away, March 24, 1603, in the presence of some of her advisers

*After a painting by P. Delacroix, in the Louvre, Paris*

half of Elizabeth's reign, extending almost to the close of the reign of her successor. Before this time it would be hard to name any English writers with a real title to the epithet great, except Chaucer and perhaps Thomas More. But at last the creative literary spirit was fermenting. The drama was born. After the Armada the great poetic flood burst forth—Spenser's *Faerie Queene*, Marlowe's tragedies, and then Shakespeare; and, following upon Shakespeare, Ben Jonson and others. The foundations were laid also of an English prose literature by the Essays of Francis Bacon, Hooker's *Ecclesiastical Polity*, the vigorous narrative of Raleigh, and also by the eccentricities of Lyly and his imitators, and the efforts of Sir Philip Sidney, in the search for a prose style.

Both the maritime and the literary energy were the expression of what was the fundamental characteristic of the Elizabethan period, its intense vitality, with free play for its activities. The "spacious days" are rightly named. Intellectually, as well as geographically, the horizon had been infinitely enlarged, the cramping conditions of the Middle Ages had been broken down; the new oceans and new lands were only the material type of the new intellectual and spiritual field which lay open to exploration and cultivation.

**Bibliography.** Lives, M. Creighton, new ed. 1899; M. Wilson, 1932; M. Waldman, 1933; J. E. Neale, 1934; Life and Times, T. Wright, 1838; Letters, ed. G. B. Harrison, 1935; Courtships, M. A. S. Hume, rev. ed. 1940; E. and Essex, Lytton Strachey, 1928. Fanfare for E., E. Sitwell, 1946.

**Elizabeth** (c. 1437–92). Queen of Edward IV of England. She was the daughter of Sir Richard Woodville, afterwards Earl Rivers, and was married first to Sir John Grey, who died in 1461. The young king met the handsome widow while hunting, and married her secretly in 1464, and in 1465 she was acknowledged queen and crowned. Of her children by the king her eldest son became king as Edward V, and her eldest daughter, Elizabeth, became the queen of Henry VII. She refounded Queens' College Cambridge, originally founded by Henry VI's consort, Margaret of Anjou. She was buried in S. George's chapel, Windsor.

**Elizabeth** (1465–1503). Queen of Henry VII. The daughter of Edward IV and Elizabeth Woodville, she was born at Westminster, Feb. 11, 1465. Negotiations for a husband were carried on by her

father, marriages with a Nevill and the dauphin of France being arranged. She was, however, unmarried when Edward died in 1483, and after the murder of her two young brothers in the Tower, she was his heiress. She was then in the power of Richard III, who contemplated marrying her. Before this time, the names of Elizabeth and Henry Tudor had been coupled, and the princess, then in Yorkshire, was probably in the

Elizabeth, Queen of George VI. Her Majesty at the state opening of the Union Parliament, Cape Town, in Feb., 1947. Inset, the Queen at the age of five. from a miniature by Mabel Hankey

plot that culminated in the battle of Bosworth. She and Henry were married, after parliament had approved of the match, Jan. 18, 1486, the rival houses of York and Lancaster being thus united. She was crowned queen Nov. 25, 1487.

Elizabeth had seven children: Arthur; Henry, afterwards Henry VIII; Margaret, who became the wife of James IV of Scotland; and Mary, afterwards the wife of Louis XII of France; and three who died in infancy. She died Feb. 11, 1503.

**Elizabeth** (b. 1900). Queen of George VI of Great Britain. She was born Aug. 4, 1900, at S. Paul's Walden Bury, Herts, third daughter of the 14th earl of Strathmore and Kinghorne. On her mother's side she was descended from Elizabeth, consort of Henry VII, on her

father's from Sir John Lyon of Forthvie, who in 1372 married the daughter of Robert II of Scotland. Lady Elizabeth

Angela Marguerite Bowes-Lyon spent most of her childhood either at S. Paul's Walden Bury or at Glamis Castle, Angus, Scotland.

On Feb. 12, 1923, her engagement to the duke of York was announced, and the marriage was celebrated at Westminster Abbey on April 26. The duke and duchess took up residence for a time at White Lodge, Richmond Park. Their elder daughter, later heiress presumptive to the throne, Princess Elizabeth, was born, April 21, 1926, while they were residing at 12, Bruton Street, London, and shortly before they went to Australia to open the new parliament house at Canberra. In 1927 they went to live at 145, Piccadilly, London, where they remained ten years. On Aug. 21, 1930, Princess Margaret was born at Glamis Castle, the first member of the British

royal family to be born in Scotland since a younger brother of Charles I.

On Dec. 11, 1936, the duke of York succeeded his brother, Edward VIII, as king, and on May 12, 1937, Queen Elizabeth was crowned with him in Westminster Abbey. She launched the liner which bears her name on Sept. 27, 1938. Long before the outbreak of the Second Great War she was actively engaged in furthering the cause of Great Britain, and the support of the North American continent owed much to the visit paid by the royal couple to Canada, New-

foundland, and the U.S.A. in May-June, 1939. There, as during their state visit to Paris in 1938, Her Majesty's charm of manner, ready sympathy, simplicity, and true understanding endeared her to men and women in every walk of life. These qualities were in still greater evidence during the war. In Sept., 1940, bombs fell on four occasions on Buckingham Palace, and with King George she replied to a cabinet message: "Like so many other people we have now had a personal experience of German barbarity which only strengthens the resolution of us all to fight through to final victory." She broadcast several messages full of appreciative sympathy to the women of the Empire, France, and the U.S.A.; and as commandant-in-chief of the Women's Navy, Army, and Air Force services she often inspected units belonging to these services. She was among those appointed to act as a counsellor of state in the event of the king's illness or absence abroad. In Feb.-April, 1947, the royal couple paid a state visit to S. Africa, where the queen's qualities evoked the same friendly response as they had received in N. America eight years earlier. A study by Lady Cynthia Asquith appeared in 1937.

**Elizabeth** (1837-98). Empress of Austria. Born Dec. 24, 1837, the daughter of Maximilian I, king of Bavaria, she married Francis Joseph of Austria, April 24, 1854. Her attempts to modify the strict etiquette of the imperial court aroused opposition amongst the nobility, but she soon gained the love of the people and retained it to the last. In 1877 she was crowned queen of Hungary. In 1889 her only son, Rudolph, died in very tragic circumstances; her cousin, Leopold of Bavaria, committed suicide, and her sister, Sophie, duchess of Alençon, was killed in a fire at a Paris charity bazaar, 1897. The empress herself was mortally stabbed by an Italian anarchist at Geneva, Sept. 10, 1898. There are Lives by K. Tschuppik, Eng. trans. E. Sutton, 1930; and Count Corti, Eng. trans. C. A. Philips, 1936.

**Elizabeth** (b. 1876). Queen of the Belgians. She was born July 25, 1876, at Possenhofen, of a younger branch of the Bavarian royal family. On Oct. 2, 1900, she was married at Munich to Albert (1875-1934, *q.v.*), who in 1909 became king of the Belgians. During the First Great War she worked constantly for the good of her

people, often visiting the front line with her husband. After his death in a mountaineering accident she withdrew from public life, and was at Laeken during the German occupation of 1940-44. Leopold III was her son, as was Prince Charles, who was sworn in as regent of Belgium in her presence on Sept. 21, 1944.

**Elizabeth** (1596-1662). Queen of Bohemia. The eldest daughter of James I of England, she was born at Falkland, Fife, Aug. 19 1596. In 1612 she was betrothed to the elector palatine Frederick V, whom she married early in 1613, beginning wedded life at Heidelberg. In 1618 Frederick was chosen king of Bohemia, and the Thirty Years' War began. He and his wife were crowned at Prague in 1619 and lived there for a time, but soon were fugitives, the queen ultimately reaching Holland, where Maurice of Orange befriended her. By this time Frederick had lost the palatinate as well as Bohemia, and the exiled pair remained in Holland, where in 1632 the elector died.

Elizabeth strove to obtain the lost palatinate for her eldest surviving son, Charles Louis, and in 1648 had the satisfaction of seeing him settled at Heidelberg. He did nothing, however, to relieve the poverty to which she was reduced by her husband's misfortunes and

Elizabeth, Queen of the Belgians

the loss of her own annuity as an English princess after the Civil War broke out. She remained in Holland, befriended by the earl of Craven, to whom report, probably incorrectly, said she was married. In 1661 she crossed over to England and was given a pension by Charles II. She was living in Leicester Square, London, when she died, Feb. 13, 1662. Elizabeth had thirteen children; two, Rupert and Maurice, fought in the Civil War for their uncle, Charles I, and the twelfth was Sophia, the mother of George I. She was beloved by the English, and a famous poem was addressed to her by Sir Henry Wotton. *Consult* Life, Carola Oman, 1938.

**Elizabeth** (1843-1916). Queen of Rumania. Born at Neuwed, Dec. 29, 1843, she was the daughter of Prince Hermann of Wied.

Elizabeth

In 1869 she married Prince (later king) Carol of Rumania. She endeared herself to her adopted country by ministrations to the wounded in the war with Turkey (1877-78), and founded the order of Elizabeth to reward distinguished Red Cross work. She became a widow Oct. 10, 1914, and died March 2, 1916.

A fine musician, and no mean painter, the queen wrote under the pen-name of Carmen Sylva and published poems and stories in Rumanian, German, French, and English. Her chief works are *Stürme*, 1881; *Leidens Erdengang*, 1882 (Eng. trans. by M. A. Nash as *Suffering's Journey on the Earth*, 1905); *Les Pensées d'une Reine*, 1882; *Pelesch Märchen*, 1883, a book steeped in Rumanian folk-lore. *Consult* Carmen Sylva, Queen and Woman, E. Burgoyne, 1941.

**Elizabeth** (1709-62). Empress of Russia. Daughter of Peter the Great, and therefore called Elizabeth Petrovna, she was born near Moscow, Dec. 18, 1709. She is said to have married a common soldier when quite young. During her cousin Anne's reign, 1730-40, she took no part in court affairs, but gave rein to her somewhat abandoned tastes. On Dec. 6, 1741, aided by her intimates and partisans, she dethroned the child emperor, Ivan VI, by a *coup d'état* at the Winter Palace, and mounted his

Elizabeth, Queen of Frederick V of Bohemia, painted by Derick Hampton Court Palace

throne. Throughout the Seven Years' War she worked steadfastly for Russian interests, implacably in her opposition to Frederick II of Prussia. Joining with France and Austria against Prussia in 1757, she was a tower of strength in that combination which brought Prussia almost to destruction by the end of 1761, her army having entered Berlin in 1760. To Frederick's great relief, Elizabeth died Jan. 5, 1762, whereupon the alliance against him collapsed. Before her accession an indolent woman, as empress she ruled with unselfish energy, strengthening Russian prestige all over Europe, and carried out various internal reforms. She founded the university of Moscow, 1755, and the academy of arts at St. Petersburg (Leningrad).

**Elizabeth** (1635-50). English princess. The second daughter of Charles I, she was born Dec. 28,

Elizabeth,  
English princess  
From an old print

1635. She was placed in the charge of parliament, and appealed in a touching letter to the house of lords for permission to retain her attendants. In 1648 she helped her brother James, duke of York, to escape. She said goodbye to her father the day before his execution, and, after a visit to Penshurst, was sent to Carisbrooke Castle, where she died, Sept. 8, 1650, from fever. She was buried in St. Thomas's church, Newport, where is a monument to her by Baron Carlo Marochetti erected by Queen Victoria in 1856.

**Elizabeth** (b. 1926). Heiress presumptive to the throne of Great Britain. The elder daughter of George VI was born at 12, Bruton Street, London, on

April 21, 1926, and baptized Elizabeth Alexandra Mary five weeks later at Buckingham Palace. The director of the princess's education was her mother, and in addition to the usual subjects she studied economic and constitutional history, and the trend of political developments. She acquired a real feeling for history and a marked sense of the richness of the tradition into which she was born. She became a good horsewoman and a fine swimmer. An excellent pianist, the first honorary distinction she accepted from a civilian body was the presidency of the Royal College of Music. Her other favourite among the arts was the drama.

In 1937, with her sister Princess Margaret, she joined the 1st Buckingham Palace company of girl guides and became a patrol leader. She became a sea ranger in 1942, later holding petty officer's rank in the sea rangers' ship Duke of York. In Dec., 1946, she was appointed Chief Ranger of the British Empire. On the princess's 16th birthday her father appointed her honorary colonel of the Grenadier Guards. She was granted a commission in the A.T.S. on March 5, 1945.

On her 21st birthday while on a tour of S. Africa with her parents, the Princess broadcast to the British Commonwealth a dedication of her life to the service of that Commonwealth. Her betrothal to her second cousin, Lieut.

Elizabeth, heiress presumptive to the British throne.  
1. In her first year. 2. The princess in her sitting-room at Buckingham Palace. 3. Fulfilling a public engagement in 1947. 4. As an officer in the A.T.S. in 1945

Philip Mountbatten, formerly Prince Philip of Greece and Denmark, was announced July 10, 1947, and they were married at Westminster Abbey, Nov. 20. The bridegroom having been created duke of Edinburgh one day earlier, the princess's official style became H.R.H. Princess Elizabeth, duchess of Edinburgh. A son, Charles Philip Arthur George, was born Nov. 14, 1948.

**Elizabeth, PHILIPPINE MARIE HÉLÈNE** (1764-94). French princess, usually known as Madame Elizabeth. Born at Versailles, May 3, 1764, she was a granddaughter of Louis XV. Devoted to her brother Louis XVI, she accompanied him on his flight to Varennes, and shared his captivity in the Temple. Accused of aiding Louis in 1792, she was guillotined, May 10, 1794.

**Elizabeth.** Pen-name of a British novelist who married as her second husband the 2nd Earl Russell. See Russell, Mary, Countess.

**Elk** (*Alces machlis*; Gr. *alkē*, Lat. *alcēs*). Largest member of the deer family, known in America as the moose. The European elk is found in Scandinavia, E. Prussia, Poland, and parts of Russia; but is now much diminished in numbers, and occurs only locally. The adult elk is usually about 6½ ft. high at the withers, and may weigh 1,000 lb. It is very long

**Elk.** Specimen of the common elk, or moose, *Alces machlis*

in the leg, of heavy build, short in the neck, with long ears, and has a long head with overhanging muzzle. The antlers of the male are broad and palmated. It inhabits dense forests, where it feeds mainly on the leaves and young branches of the willow and birch as well as on lichens and moss. The flesh is apt to be coarse, and has a musky flavour. See Moose.

**Elk.** Group of mountains of Colorado, U.S.A., in Pitkin co. They form a section of the Rockies near Aspen, and the highest summit is Castle Peak, with an elevation of 14,259 ft.

**El-Kab.** Site of the ancient city Nekheb, near the right Nile bank, 44 m. above Luxor, Upper Egypt. The predynastic capital of the S., it was sacred to the vulture-goddess Nekhbet. Within the girle-wall, 37 ft. thick and enclosing 75 acres, Quibell conducted excavations in 1897. In the vicinity are many rock-cut tombs with agricultural and domestic scenes. The royal residence lay across the stream at Hieraconpolis.

**Elkan**, BENNO (b. 1877). German sculptor. Born at Dortmund, Dec. 2, 1877, he was educated in Switzerland and studied in Paris and Rome. He was represented in international exhibitions in Germany, France, Italy, and England, where he worked from 1933. His works included tombs, busts, medals, and monuments; his war memorials in Germany were removed by the Nazis. In England he achieved fame by a statue of Raleigh and bronze candelabra with biblical figures for King's

Chapel, Cambridge. Other works include The Four Cardinal Virtues, at Buckfast Abbey, and a plaque at the Rudyard Kipling memorial building, Windsor.

**Elkesaites** OR **ELCHASAITES**. Heretical 3rd century sect which followed alleged revelations contained in the Book of Elchasai. This taught that the Son of God had been manifested in the persons of many good men, and that Christ was merely one manifestation.

**Elkhart.** City of Indiana, U.S.A., lying 100 m. E. of Chicago, in Elkhart co., at the junction of the Elkhart and St. Joseph rivers. It makes 60 p.c. of all band and orchestral instruments played in the world. Other products are motor and aircraft, railway and steamship equipment, pumps, presses, and tools. There are several rlys. and an airport. Settled about 1833, Elkhart received its city charter in 1875. Pop. 33,434.

**Elkington**, GEORGE RICHARDS (1801-65). British manufacturer. Born Oct. 17, 1801, at Birmingham, the son of a spectacle-maker, he became partner and afterwards sole proprietor of his uncle's silver-plating business in that city. By energy and experiment he made electro-plating a commercial proposition, and superseded the old-fashioned method of plating by soldering thin sheets of silver upon copper. He died Sept. 22, 1865.

**Elk's-horn Fern** (*Platyserium*). A small genus of large epiphytall ferns. They are natives of Australia, Malaya, and Africa. The lower fronds, which are barren, are thick and undivided, and spread close to the tree-trunk on which

**Elk's-horn Fern.** Specimen of *Platyserium grande*, growing on a tree trunk

they grow. The much longer fertile fronds present the appearance of a stag's antlers. In an Indian species (*P. biforme*) they are from 6 ft. to 15 ft. in length.

**El** (Lat. *ulna*, Ger. *ellenbogen*, Eng. elbow). Medieval European measure of length. It varies from the English ell, probably borrowed from France, which equals 45 ins., to the Scottish of 37 ins. and the Flemish of 27 ins.

**Ellagic Acid** OR **BEZOARDIC ACID** ( $C_{14}H_6O_8$ ). Constituent of the animal concretions which are met with in Oriental countries under the name of bezoars. It can also be made artificially by treating gallic acid in acetic acid solution with potassium persulphate and sulphuric acid. The name is Fr. *galle* (gall) reversed, with suffix *ic*.

**Elland.** Town and urban district of the West Riding of Yorkshire, England. It stands on the Calder, 3 m. S.E. of Halifax, and has a railway station. The industries include the manufacture of textiles, while there are stone quarries in the neighbourhood. The chief public building is S. Mary's church. Until 1950 Elland gave its name to a parl. div. Pop. 10,327.

**Ellenborough**, EDWARD LAW, BARON (1750-1818). British lawyer. Born at Great Solkeld, Cumberland, Nov. 16, 1750, he was educated at Charterhouse and Peterhouse, Cambridge. He was called to the bar in 1780 and eight years later was leading counsel for Warren Hastings (q.v.). In 1802 he was appointed lord chief justice and created a peer. He was the only chief justice to accept a seat in the cabinet. He resigned office in Nov., 1818, and died Dec. 13.

**Ellenborough**, EDWARD LAW, EARL OF (1790-1871). British administrator. Born Sept. 8, 1790, the eldest son of Baron Ellenborough he was educated at Eton and S. John's College, Cambridge, and in 1813 entered parliament.

1st Ear. of Ellenborough, British administrator

Made lord privy seal in 1823, he became president of the board of control, and in 1841 governor-general of India. He crushed the Afghans, annexed Sind in 1842 and subdued Gwalior, 1844. Made an earl on his recall, he was first lord of the Admiralty in 1846, and

president of the board of control in 1858. He died Dec. 22, 1871.

**Ellen's Isle** or **EILEAN MOLACH**. Islet in Loch Katrine, Perthshire, Scotland. It is the scene of Scott's *Lady of the Lake*.

**Ellerman Lines.** British steamship company. An offshoot of the Bibby Line, founded in 1840, it was purchased in 1870 by F. Leyland and Co., and flourished as the Leyland line until 1902, when it was sold, the Atlantic service being acquired by the International Mercantile Marine, a U.S. combine, and the Mediterranean services by Sir J. R. Ellerman (1862-1933).

Ellerman Lines Ltd. controls the City, Ellerman, Hall, Bucknall, Papayanni, Westcott, and Laurance lines. The City and Hall lines run passenger and cargo vessels from Liverpool and Glasgow to India and Africa; the Ellerman and Bucknall lines operate services to Africa, Australia, New Zealand, India, and the Persian Gulf, the Far East, and New York; the Westcott and Laurance lines serve the Mediterranean, Black Sea, and the Danube ports from London; while the Ellerman and Papayanni lines have similar services from Liverpool. The Ellerman lines lost 60 vessels during the Second Great War. The headquarters of the combination are 104-107, Leadenhall St., London, E.C.3.

**Elles**, **SIR HUGH JAMIESON** (1880-1945). A British soldier. Born April 27, 1880, in India, he went to Clifton and the R.M.A. He was gazetted to the R.E. in 1899 and served in the South African War. He passed the Staff College course, 1913-14. Crossing with the B.E.F., he served in France throughout the First Great War. He was promoted temporary major-general commanding the Tank Corps in 1918, and was created K.C.M.G. in 1919. Elles was director of military training at the War Office, 1930-33, and master general of ordnance, 1934-38; colonel commandant of the Royal Tank Regiment from 1934, and of the R.E. from 1935. Promoted general in 1938, he retired the same year and was regional commissioner for S.W. England in 1939-40. He died July 11, 1945.

**Ellesmere.** Urban dist. and market town of Shropshire, England. It is 11 m. S.W. of Whitchurch on the riv. and on the mere and canal of the same name. No traces remain of its castle, whose site is now occupied by a bowling green. S. Mary's church

Ellen's Isle, in Loch Katrine, immortalised in Scott's poem, *The Lady of the Lake*

is a fine Gothic structure. Agriculture is the main industry. There is excellent fishing in the district. Market day, Tues. Pop. 1,872.

**Ellesmere.** An island in the district of Keewatin, N.W. Territories, Canada. It is the largest of the most N. group of Eastern Arctic Islands, and is separated from Greenland by Smith Sound and Kennedy and Robeson Channels. The N. portion is known as Grant Land, and the country to the S.E. as Grinnell Land from its discovery in the second Grinnell expedition, 1854. The interior W. was explored by Greeley and Lockwood (1882-83). The E. coast is steep and rocky, and part of the interior is covered by an extensive ice-cap, but on the W. coast are low rolling areas which supply vegetation for roaming herds of caribou and musk-ox. The highest named peak in Grinnell Land is Mt. Arthur (5,000 ft.) but there are higher ranges beyond. In Lady Franklin Bay, Grant Land, Tertiary coal has been found, the most northerly deposit of fossil fuel known.

**Ellesmere**, **EARL OF**. British title borne since 1846 by the family of Egerton. Frances Leveson-Gower, a younger son of the 1st duke of Sutherland, assumed the name of Egerton in 1833, when he inherited the estates of the Egertons, dukes of Bridgewater. He was a politician with remarkably enlightened views, and won some distinction as a writer and a patron of the arts. He was created Earl of Ellesmere in 1846, and died Feb. 18, 1857. The 5th earl was born in 1915 and succeeded his father in 1944. He has property at Newmarket and at St. Boswells, Roxburghshire. The heir is called Viscount Brackley.

**Ellesmere Port and Whitby.** Urban dist. of Cheshire, England. It is 7 m. N. of Chester, on the Mersey, and the first port of call on the Manchester ship canal. One of the largest oil ports in the

U.K., it has also iron-works, paper works, flour mills, and dye-works. Pop. 27,750.

#### **Ellice Islands.**

Group of coral islands in the Pacific Ocean. Called the Lagoon islands, they lie N. of Fiji, between lat. 5° 30' and 11° 20' S. and long. 176° and 179° 50' E. The chief industries are connected with phosphates and copra. Formally annexed by

Great Britain in 1915 as the Gilbert and Ellice Islands Colony, they are under the jurisdiction of the high commissioner for the W. Pacific. Area 14 sq. m. Pop. 4,613.

Never attacked by the Japanese, they formed an advanced Allied base during the winter of 1942-43.

**Ellichpur.** Town of India. The chief place in Berar (*q.v.*), it is 100 m. W. of Nagpur. Once an important city and a military cantonment, its prosperity has declined. By local tradition it is supposed to date from the 11th century; it is known to have been prominent in the 13th century, and then passed under Mahomedan rulers. Besides an old palace, the town contains early remains, including a burial shrine associated with a mythical hero, Shah Abdur-Rahman. Cotton is the chief industry. Pop. 21,200.

**Ellington**, **EDWARD KENNEDY** (b. 1899). American negro musician. "Duke" Ellington was born at Washington, April 29, 1899, and first conducted his own band in New York in 1926. Next year, conducting as Duke Ellington at the Cotton Club in Harlem, he achieved an enormous reputation for "hot jazz" and soon took his band throughout the U.S.A. and in 1933 on a European tour. A master of orchestral colour, jazz rhythms, and effective dissonance, he composed songs like *Mood Indigo* and *Solitude* which remained long in the dance music repertory.

**Ellington**, **SIR EDWARD LEONARD** (b. 1877). British air force officer. He was born on Dec. 30, 1877, educated at Clifton and the R.M.A., and commissioned in the Royal Artillery in 1897. He transferred to the R.F.C. 1913, and served in France during the

Sir Edw. Ellington, British air force officer

First Great War. Director general of supply and research at the Air ministry, 1919, he was created a K.C.B. the following year. In 1923 he was A.O.C., R.A.F., in India; in 1929 A.O.C.-in-C., Air Defence of Great Britain. Ellington was appointed chief of the air staff in 1933, and was inspector-general of the R.A.F. 1937-40. He was promoted marshal of the R.A.F. in 1937.

**Elliot, JANE OR JEAN** (1727-1805). Scottish song writer. The daughter of Sir Gilbert Elliot, 2nd bart., of Minto, she is famous as the author of *The Flowers of the Forest*, which Sir Walter Scott included in his *Minstrelsy of the Scottish Border*, 1802. She died in Edinburgh, March 29, 1805.

**Elliot, JOHN** (d. 1808). British sailor. Son of Sir Gilbert Elliot, a Scottish judge, he entered the navy and in 1758 served under Hawke and Anson. He distinguished himself in 1760 off the coast of Ireland in the capture of three French vessels. After serving in the Mediterranean and at Plymouth he commanded the *Trident* to America. In 1779 he sailed under Rodney to the relief of Gibraltar, distinguished himself at St. Vincent, and fought under Kempenfelt. During 1786-89 he was commander-in-chief at Newfoundland, and was promoted admiral, 1795, when he retired. He died Sept. 20, 1808.

**Elliot, WALTER ELLIOT** (b. 1888). Scottish politician. Born Sept. 19, 1888, he was educated at Glasgow

Walter Elliot,  
Scottish politician

academy and university and became a doctor, serving as such in the First Great War. He entered parliament in 1918 as Unionist member for Lanark. From 1924 until defeated by 88 votes in 1945 he represented the Kelvingrove division of Glasgow. After holding several junior offices, he became minister of Agriculture, 1932-36, secretary for Scotland, 1936-38, minister of Health, 1938-40, and director of public relations at the War Office, 1941-42. He came back to the house of commons through a by-election for Scottish Universities in 1946. Elliot was one of the most familiar speakers on the B.B.C. Brains Trust.

**Elliot, CHARLOTTE** (1799-1871). English hymn-writer. She was born at Clapham, March 18, 1799,

and after an uneventful life, passed for the most part as an invalid, she died at Brighton, Sept. 22, 1871. Her hymns, amounting to about 150, placed her among the foremost British women hymn-writers. Many became popular, notably "Just as I am, without one plea."

**Elliott, EBENEZER** (1781-1849). British poet, known as the Corn Law Rhymmer. Born at Masborough,

Ebenezer Elliott,  
British poet  
From a contemporary  
sketch

York, March 17, 1781, he was engaged, like his father, in the iron trade. He attributed his father's ruin and his own early losses to the bread tax, and in his *Corn Law Rhymes* (1831) he depicted in vigorous language and with intense feeling the sufferings of the poor under the Corn Laws. His hymn beginning "When wilt Thou save the People?" is still sung. He died at Great Houghton, Dec. 1, 1849.

**Elliott, GRACE DALRYMPLE** (c. 1758-1823). Reputed mistress of George IV. She was a daughter of

Grace Dalrymple  
Elliott,  
British adventuress  
After Corway

Hew Dalrymple, an Edinburgh lawyer, was educated in France, in 1771 married John Elliott, and was divorced in 1774. About 1782 she gave birth to a daughter, of whom the prince of Wales acknowledged himself the father. She subsequently settled in France, and died near Sévres, May 16, 1823. Her account of her life during the French Revolution was published in 1859.

**Elliott, MAXINE** (1873-1940). American actress. Born at Rockland, Maine, Feb. 5, 1873, she

began acting in *The Middleman*, with E.S. Willard (New York, Nov. 10, 1890), and was soon taking leading parts, including that of Mrs. Allenby in *A Woman of No Importance*. Her

Maxine Elliott,  
American actress  
L. Caswell Smith

Shakespearian renderings were greatly praised. Her first appearance in London was as Silvia in *The Two Gentlemen of Verona*, Daly's, July 2, 1895; thenceforward she acted in England frequently, a notable success being *Zuleika* in Joseph and His Brethren (His Majesty's, 1913). She died March 6, 1940. Her sister, Gertrude, also an actress, married Sir Johnston Forbes Robertson (q.v.).

**Elliott, WALLACE HAROLD**. British clergyman. Elliott was educated at Collyer's school; Brasenose College, Oxford; and Ripon Clergy College. He was curate of Guisborough, 1907-09; vicar of Holy Trinity, Folkestone, 1918-29; a canon and precentor of St. Paul's Cathedral, 1929-30; and vicar of St. Michael's, Chester Square, until 1941. Elliott was then appointed precentor of H.M. Chapels Royal and deputy clerk of the closet. He became chaplain of the order of St. John of Jerusalem, 1944. His weekly religious addresses on the radio were famous in the 1930s. Published works include *Rendezvous*; *The Christian in His Blindness*; *Broadcast Addresses*.

**Ellipse** (Gr. *elleipsis*). A curve such that the sum of the distances of any point on it, from two fixed

Ellipse.  $SS'$ , foci on the axis  $XX'$ ,  $AA'$  principal diameter.  $P$  is any point on the ellipse, and has the property that  $SP + S'P$  is constant

points within it, is constant. When the fixed points coincide the curve becomes a circle. See *Conic Sections*.

**Ellipsis**. Figure of speech, whereby part of a sentence, strictly necessary for complete fullness of expression, but which can easily be supplied from the grammatical connexion, is omitted. It is often deliberately employed in writing, in order to lay stress upon what is more important and essential, unessentials being omitted.

**Ellipsoid**. Solid of which all sections are either ellipses or circles. See *Geometry*.

**Ellis, HENRY HAYLOCK** (1859-1939). British author and psychologist. Born at Croydon, Feb. 2, 1859, he studied medicine at St. Thomas's Hospital, London, but before qualifying went to Australia, where he spent 1875-79 as a

teacher. Returning to England, he qualified, but after two years in medical practice he gave himself

Havelock Ellis,  
British author and  
psychologist

almost exclusively to literary and scientific work. From 1889 to 1914 he edited the *Contemporary Science Series*. A student of the pathological and psychological aspects of sex, in 1897 he published the first volume of studies in the *Psychology of Sex*, the seventh and final volume appearing in 1928. Although this was written as a strictly scientific treatise and made no effort to popularise the subject, the first volume gave rise to an outburst of scandalised vituperation and a prosecution followed, with the consequence that later volumes were published in the U.S.A. He died July 8, 1939.

Ellis's psychological work was based upon biological study rather than experimental work; therefore his position has been obscured by the greater popularity enjoyed by Freudian psychology. His writings are distinguished by a deep sympathy and understanding combined with what was when he began to write a new and scientific approach to old problems. In addition to *Studies in the Psychology of Sex*, Ellis wrote on general literary and psychological subjects, e.g. *The New Spirit and the Criminal*, 1890; *Affirmations*, 1897; *The Nineteenth Century*, 1900; *The World of Dreams*, 1911; *The Philosophy of Conflict*, 1919; *Little Essays of Love and Virtue*, 1922; *The Dance of Life*, 1923; *Sonnets from the Spanish*, 1925; *My Confessional*, 1934. His autobiography, *My Life*, appeared posthumously in 1940.

**Ellis, Mary** (b. 1899). American actress and singer. Born in New York, June 15, 1899, she became an art student and subsequently studied singing, making her first appearance on the London stage in 1930 in *Knave and Queen*. The following year she played in O'Neill's *Strange Interlude*. Other successes include *Music in the Air*, 1933; and she was associated with Ivor Novello in his productions, *Glamorous Night*, 1935; *The Dancing Years*, 1939; *Arc de Triomphe*, 1943, and *The Gay Pavilion*, 1945. She also made films in Hollywood.

**Ellis, ROBINSON** (1834-1913). British classical scholar. He was born at Barming, Kent, Sept. 5, 1834, and educated at Rugby and Balliol College, Oxford, where his career was most distinguished. In 1883 he became reader in Latin at the university, and in 1893 professor of Latin. He is chiefly known for his work on Catullus, whose poems he edited and also translated in the original metres; while his *Commentary on Catullus* (1876, 2nd ed. 1889) ranks as the highest authority on its subject. He died at Oxford, Oct. 9, 1913.

**Ellis Island.** Island with an area of 27½ acres in Upper New York Bay, U.S.A. It is a headquarters of the immigration and naturalisation service of the U.S. department of labour. Here immigrants of dubious status remain while the authorities investigate their conformity with immigration regulations. The station was opened in 1892.

**Elliston, ROBERT WILLIAM** (1774-1831). British actor and theatrical manager. Born in London, April 7, 1774, the son of a watchmaker, and educated at St. Paul's School, he made his first appearance at Bath, as Tresselt in *Richard III*. On Aug. 29, 1796, he played Sir Edward Mortimer in a revival of George Colman's *The Iron Chest* at The Haymarket. He made his début at Drury Lane, Sept. 20, 1804, succeeding Kemble as Rolla in *Pizarro*, continued a member of the company till 1809, rejoined it for 1812-15, and was lessee of the theatre 1819-26, when he retired bankrupt. He afterwards became lessee of the Surrey Theatre, where he played until within a fortnight of his death on July 8, 1831. Both as tragedian

and as comedian Elliston stands high in the annals of the British stage.

**Ellora.** Ruined town of India, in Hyderabad state, 13 m. N.W. of Aurangabad. It is famous for the Kailas temple, 8th cent., and for its rock temples and caves dating from the 5th to the 9th or 10th cent. These caves cover the face of a hill for 1½ m. and belong to three groups—Buddhist, 12 caves, Brahminical, 17, and Jain, 5. See illus. p. 1871.

**Ellore.** Town of Madras, India, in the Kistna dist. It stands near Colair Lake, 38 m. N. of Masulipatam. Ellore is noted for its carpets, and has a large trade in grain. Pop. 65,631, nearly all Hindus.

**Ellsworth, LINCOLN** (b. 1880). American explorer. Educated at Columbia and Yale universities, he held a number of engineering appointments in the U.S.A. and Canada until 1924, when he organized a geological expedition to the Andes. In 1925 he was commander and navigator of the Amundsen-Ellsworth polar expedition and in 1926 joint leader of the Amundsen-Ellsworth-Nobile transpolar flight from Spitsbergen to Alaska. He was scientific director of the Wilkins-Ellsworth trans-Arctic submarine expedition of 1931, and in 1935 flew 2,000 miles across the Antarctic, claiming 300,000 sq. m. of territory for the U.S.A. His expeditions earned him awards from many foreign governments and scientific societies. He published *Our Polar Flight* (1925); *First Crossing of the Polar Sea* (1926); *Beyond the Horizon* (1938). See *Antarctic Exploration*; *Arctic Exploration*.

**Ellwood, THOMAS** (1639-1714). English author and Quaker. He was born at Crowell, Oxon, and became a Quaker in 1659, a conversion which cost him several terms of imprisonment. He became companion and reader to Milton after the latter lost his sight, and suggested to him the idea of *Paradise Regained*. He assisted George Fox in the dissemination of his principles. Ellwood's most important work is his autobiography, which was finished by Joseph Wye and published in 1714; new ed. 1900. He died March 1, 1714.

**Elm** (*Ulmus*).

A native tree of Great Britain, of the family Ulmaceae. More frequently found in avenues, parks, and hedges than in woods and forests, elms flourish in any soil, but to attain to their full height of 80 ft. or thereabouts, and to make the best wood, require a rich alluvial loam. The most familiar species are wych elm (*U. montana*) and bell elm (*U. campestris*). Both may be planted

Elm tree in full foliage. It is a comparatively shallow rooting tree  
F. R. Hinkins

in open weather at any time between autumn and spring. The usual way of increasing in private

Elm. Leaves and flowers of common elm

gardens is by layering, or in the case of the bell elm by removal of suckers, as this tree seeds scantily. Elms should not be planted near dwelling-houses, as the timber has a tendency to decay inwardly, involving

danger of the limbs dropping off suddenly, without any warning, especially in high winds.

**Elman**, MISCHA (b. 1891). Russian violinist. Born at Talnoï, Russia, Jan. 20, 1891, he received his musical education at Odessa and under Cui at St. Petersburg (Leningrad). He made his début there in 1904, afterwards appearing in Berlin, Dresden, and elsewhere. His first appearance in London took place March 21, 1905; in New York in 1908. From the first he was recognized as one of the world's greatest violinists. He later resided chiefly in the U.S.A.

**Elmet**. Name of a little British kingdom in Yorkshire. It existed in the 6th century and earlier, but was ended when conquered by Edwin, king of Northumbria, about 617. Its extent roughly corresponded to the West Riding. The name was long preserved by the forest of Elmet and exists in Barwick-in-Elmet and Sheburn-in-Elmet, both near Leeds.

**Elmina** OR ST. GEORGE DEL MINA. Small port of the Gold Coast colony, 8 m. W.S.W. of Cape Coast Castle. It was the first lasting European settlement on that coast. Here is a castle, built by the Portuguese in 1482 and succeeding years, taken by the Dutch in 1637, and transferred to the British in 1872.

**Elmira**. City of New York, U.S.A., the co. seat of Chemung co. On the Chemung river, 145 m. S.E. of Buffalo, it is served by several rlys. It contains the state reformatory for male offenders between 16 and 30. Elmira College for women, 1855, was the earliest U.S. college to give women degrees comparable with those for men. A busy rly. and industrial centre, Elmira makes bridges, office equipment, boilers, valves, leather and knitted goods. Settled in 1788, it

was incorporated in 1828 and received a city charter in 1864. Mark Twain wrote much and is buried here. Pop. 45,106.

**El Misti**. Volcanic mt. of Peru in the prov. of Arequipa, by which name the mt. itself is sometimes called. It is a few miles N.E. of Arequipa city. Alt. 19,200 ft.

**Elmore Process**. Method of making seamless copper (or other metal) tubes by depositing the metal by electrolytic action on a bar or mandrel kept rotating in the electric bath. It was devised by J. O. S. Elmore, an engineer in India, in 1896. A tube so formed would be wanting in mechanical strength if the deposition only were depended upon. Elmore therefore compacted the tube as the deposition of metal proceeded by rotating the mandrel against an agate burnisher, and thus greatly increased its strength. The advantage of the process lies in the purity of the product and the elimination of smelting processes.

**Elmshorn**. Town of Slesvig-Holstein, Germany. It stands on the Krüchau, about 10 m. from its junction with the Elbe and 23 m. N.W. of Hamburg. It is a river port. Pop. 15,392.

**Elmsley**, PETER (1773-1825). British scholar. Educated at Westminster School and Christ Church, Oxford, he showed a remarkable aptitude for study. He was ordained, but devoted most of his time to the study of the classics and won a reputation throughout Europe by his critical work on the Greek tragedians. He wrote for the *Edinburgh Review* and the *Quarterly Review*. In 1823 he became principal of St. Alban Hall and Camden professor of ancient history at Oxford. He died March 8, 1825.

**Elmslie**, WILLIAM GRAY (1848-89). British divine. Born at Insh, Aberdeenshire, Oct. 5, 1848, he was educated at Aberdeen university and New College, Edinburgh, and later studied in Germany. In 1873 he became assistant to Dr. J. Oswald Dykes, at Regent's Square Presbyterian church, London, and was chosen minister of Willesden Presbyterian church in 1875. In 1880 he was appointed tutor of Hebrew in the Presbyterian College, London, being elected to the professorship of Hebrew and O.T. literature in 1883. He died Nov. 16, 1889.

His son, William Alexander Leslie (b. 1885), a distinguished Oriental scholar, clergyman, and professor, wrote *Aboda Zara* or *The Mishna on Idolatry*, 1911, and *Studies in Life from Jewish Pro-*

verbs, 1917. He became principal of Westminster College, Cambridge, in 1935.

**Elobey**. Two small islands, called Great and Little, off the mouth of the Gabun river, W. coast of Africa, belonging to Spain. Great Elobey is covered with bush, and has an area of  $\frac{3}{4}$  sq. m. The area of Little Elobey is 22 acres. The islands are under the control of a sub-governor, who is responsible to the governor-general resident at Santa Isabel on the island of Fernando Po. The inhabitants are mostly of the Benga tribe.

**Elocution** (Lat. *eloqui*, to speak out). The art of effective public speaking. In classical times it included oratory, but now refers solely to the method and manner of delivery, the right study of which includes breath control, voice production, articulation, pronunciation, and expression.

Breath is the motive power of the voice. Authorities agree that the intercostal diaphragmatic method of breathing, i.e. the free expansion laterally of the lungs at their base and the descent of the diaphragm in inspiration and the reverse action with an even abdominal pressure in expiration—inhalation quickly and silently and exhaling slowly and evenly—gives a maximum of breath with a minimum of exertion. There should always be a supply of breath in the lungs, and inspiration should be renewed well before expiration is accomplished. A speaker's words should be poised on the breath, for any escape through or between the words will cause loss of tone and power and, under continuous strain of public work, may lead to permanent injury of the voice. An open throat, a mobile jaw, muscular control of the tongue and soft palate, together with right control of the breath, are the keynotes of correct voice production.

A sense of rhythm and beauty of diction, with a distinctive delivery, is as essential in the speaking of modern, as in that of classical, selections. Enunciation is the medium for expressive pronunciation, clearness of articulation being of the greatest importance. The tongue, hard and soft palate, gums, teeth, and lips all constitute part of the articulating organs, and by their partial or complete contact the consonants are formed. Vowels, being purely vocal, are produced by the changing shape of the mouth cavity and varying positions of the tongue. Pace must be varied according to the different emotions expressed. Emphasis is

used principally to mark the salient word or words of a sentence, so as clearly to define the meaning. Its too frequent use negatives its own value, and over-emphasis is an offence to the intelligence. Pauses facilitate proper phrasing, and at the same time permit the reciter to take breath; the rhetorical pause, in which the breath is suspended, is used to emphasise some special effect. Tone should illumine and colour the words so that the full beauty of the theme is expressed.

**Elohism.** Term used in Biblical criticism to denote the writer of one of the documents used in the compilation of the Pentateuch, or rather the Hexateuch. This is called the Elohist document, because the writer uses consistently the name *Elohim* for the God of the Hebrews, whereas the writer of another document (the Jehovistic) employs with equal consistency the divine name *Jehovah*.

**Elongation.** In astronomy, the angle subtended at the earth between a planet and the sun. For Mercury it varies between  $0^\circ$  and  $28^\circ$  (greatest elongation) as the planet revolves in its orbit; for Venus between  $0^\circ$  and  $48^\circ$ . These planets are therefore always seen close to the sun, i.e. as morning or evening stars. For the outer planets the elongation can have any value from  $0^\circ$  to  $180^\circ$ , and they are therefore visible from time to time at all hours of the night.

**Elongation.** In metallurgy, the degree of permanent extension in a test piece of standard dimension before fracture takes place under the action of tensile stresses. It is invariably expressed as a percentage of the original gauge length marked off on the test piece. As so defined, elongation is the sum of two separate and measurable elongations, one being a general extension over the whole of the parallel part of the specimen, and the second a local extension taking place at the point of fracture. The first increases with the applied load and varies directly with the gauge length, while the local extension varies with the cross-sectional area and is independent of the gauge length. This implies that as the gauge length becomes shorter the effect of this local extension upon the extension as a whole becomes greater, so that the gauge must bear a certain relation to the cross-sectional area of the test specimen.

**Elopement.** Name given to the secret flight of a pair of lovers, generally with the object of mar-

riage. Unless abduction can be proved it is not an offence against the law. See Abduction.

**El Paso.** City of Texas, U.S.A., the county seat of El Paso co. The largest city on the Mexican border, a favourite health resort, and a port of entry, it stands 3,760 ft. above sea level on the Rio Grande, which separates the state from Mexico. Situated opposite Ciudad Juarez, it is served by several rlys. El Paso processes copper, lead, and silver ores, refines petroleum, and ships oil, ores, livestock, wool, hides, cotton, and farm produce. It has saw mills, cotton mills, machine shops, and flour mills. The area is to benefit from Elephant Butte dam, on the Rio Grande, 120 m. to the N. El Paso was named from its situation in a rift in the mountains, and was settled in 1827, being incorporated as a town in 1875. English and Spanish are spoken in the city, 60 p.c. of whose inhabitants are of Mexican blood and whose architecture is largely Spanish. Fort Bliss, the largest U.S. cavalry post, is here. Pop. 96,810.

**Elphinstone,** MOUNTSTUART (1779-1859). British administrator. Born Oct. 6, 1779, the fourth son of the 11th Baron Elphinstone, he entered the Bengal civil service in 1796. Appointed resident at Nagpur in 1804, he was sent as envoy to Kabul in 1808, and

Mountstuart Elphinstone, British administrator  
From a portrait in the British Museum

was resident at Poona in 1811-17, and commissioner after its annexation. During 1819-27 he was governor of Bombay. He returned to England in 1829 and lived in retirement, twice refusing the governor-generalship of India, and died Nov. 20, 1859. Elphinstone compiled the famous legal code known by his name, and virtually founded the system of state education in India. Elphinstone College, Bombay, was endowed by the natives as a memorial to his administration. He wrote a valuable account of the Kingdom of Cabul and its Dependencies, 1815; and a History of India, 1841. His own life was written by J. S. Cotton, 1892.

**Elphinstone, WILLIAM** (1431-1514). Scottish prelate. A native of Glasgow, he attended its university, of which he became rector in 1474. He was made

bishop of Ross in 1481, and nominated to the see of Aberdeen in 1483. In 1488 he was appointed lord chancellor and lord privy seal in 1492. In 1494 he established King's College, the original foundation of Aberdeen university, appointing Boece (q.v.) first rector and securing grants from James IV for its maintenance. He introduced the printing press into Scotland, 1507. He died at Edinburgh, Oct. 25, 1514, it is said through grief over the battle of Flodden.

**Elsie Venner.** Novel by Oliver Wendell Holmes. After serial publication in the Atlantic Monthly under the title of The Professor's Story, the novel was published in volume form in 1861 as *Elsie Venner: a Romance of Destiny*. Its theme is the possible effect of antenatal influence upon individual conduct. A mother is bitten by a rattlesnake shortly before giving birth to her child. The romance shows Elsie Venner's whole life and character affected by that pre-natal poisoning, since her nature turns out to be half that of a snake.

**Elsinore** (Dan. *Helsingør*). Seaport in Denmark. In the dist. of Frederiksborg and on the island of Zealand, it stands on The Sound, and has ferry communication with Helsingborg on the Swedish coast, and connexion by rly. with Copenhagen, 25 m. S. Shipbuilding is the principal occupation, and ironfounding, engineering, and agriculture are carried on. The place is the scene of Shakespeare's Hamlet. Pop. 15,841.

**Elster.** Name of two rivers of Germany, the Schwarze (black) and Weisse (white). The former rises in the mountains between Saxony and Bohemia and flows mainly N. until it falls into the Elbe 10 m. above Wittenberg. Its length is 110 m. The white Elster rises near Eger in the Elstergebirge in Bohemia, but most of its course is in Saxony. It falls into the Saale in two branches, one near Halle and the other near Merseburg. It flows past Plauen and Leitz, and past Leipzig, where the Pleisse joins it. Its length is 120 m. The town and watering-place of Elster stands on the white Elster near the Bohemian border. The Elstergebirge is a range of mountains in Bohemia. It runs from the Erzgebirge to the Fichtelgebirge, and reaches a height of 2,630 ft.

**Elstow** (formerly Helenstow). Parish and village of Bedfordshire, England. It is 1 m. S. of Bedford, and is noted as the birthplace of

John Bunyan (*q.v.*). The church, restored 1880, includes early Norman work.

**Elstree.** Parish and village of Hertfordshire, England. It has a railway station, 7 m. S. of St. Albans. The church of S. Nicolas was rebuilt in the 19th century. Here are paper mills and a large reservoir used for fishing and boating. Film studios are at Boreham Wood near by. Pop. 3,457.

**Elswick.** District of Newcastle-upon-Tyne, England, including a ward in the W. of that county borough, and having a railway station. Here are extensive works of Vickers-Armstrong, Ltd. During both Great Wars vast quantities of munitions of war were manufactured here. Elswick Park was opened as a public recreation ground in 1878.

**El Teb, BATTLE OF.** Fought by the British, Feb. 29, 1884, against the Arabs. El Teb is a post in the Anglo-Egyptian Sudan, on the road from Trinkat on the Red Sea to Tokar. In 1883 Osman Digna was besieging Tokar, and Valentine Baker, with a force of 4,000 men, was sent to relieve it. On Feb. 4, 1884, he was met by the tribesmen and was routed, two-thirds of his men being killed. Tokar then surrendered.

A British force of 4,400 men was then collected from Egypt and India, and under Sir G. Graham was landed at Suakin. On Feb. 29 this force faced the Arabs in their camp at El Teb. The latter threw themselves in wild fury against the British square, but after a fierce combat they were decisively beaten. The British casualties were 34 killed and 155 wounded, largely incurred in a charge made by the 10th and 19th Hussars.

**Eltham.** Parish of Kent, in the London bor. of Woolwich, 8 m. S.E. of London Bridge by Southern rly. Once a marketing town, it contained a palace, the fine banqueting hall of which still remains. Well Hall, an Elizabethan mansion, is supposed to have been occupied by Sir Thomas More's daughter. The Tudor outbuilding was restored in 1935 and is now used as an art gallery and restaurant. Eltham has many open spaces, including Eltham Common,

Avery Hill, and Well Hall Pleasaunce. Pop. 23,308.

Eltham Palace was built towards the end of the 13th century. It owes its origin to Anthony Bec, bishop of Durham, who appears to have lived here c. 1296-1311. At first a fortified manor house, it was subsequently converted into a royal residence. The great hall and part of the old kitchens adjoining are fine examples of domestic architecture of the reign of Edward IV. The 15th century bridge across the moat, which still remains, led by way of a gatehouse to a large court. The architecture of the palace is notable for the fine oriel windows, the open timber roof of the hall, and the gables, with beautifully carved barge boards, of the kitchens. In 1933 Stephen Court-auld was granted a 99 years' crown lease of Eltham Palace on condition that he restored the buildings, demolished the haphazard additions, and built a new house on approved plans. In 1945 he surrendered his lease and on Sept. 26 Lord Nathan, under-secretary for War, opened Eltham Palace as a training college for the Royal Army Educational Corps.

**Eltham.** Township of North Island, New Zealand. It is on the main line from Wellington to New Plymouth, from which it is 36 m. S. The chief centre of the Taranaki district, it has an extensive dairy-industry. Pop. 1,880.

**Elton or YELTON.** Salt lake of Russia, in the region of Stalingrad. It lies on the border of the Kirghiz Steppes, 60 m. E. of the Volga. Area, 60 sq. m. Although it receives the waters of several streams and has no outlet, it is very shallow, and strongly impregnated with salt, thousands of tons being extracted from it yearly. The Kalmucks call it the lake of gold.

**Elton, GODFREY ELTON, 1ST BARON (b. 1892).** British political writer. Born March 29, 1892, he

was educated at Rugby and Balliol College, Oxford, and at Queen's College became lecturer in

Lord Elton,  
British political  
writer

modern history, 1919-39. An admirer of Ramsay MacDonald (whose Life he wrote, first vol. 1939), he was expelled from the Labour party in 1931 for support of that statesman at the time of the formation of the National government. The following year he became editor of the National Labour party's official organ, The News-Letter, a post he retained until 1938. He was raised to the peerage as Lord Elton of Headington in 1934. His publications include verse, essays, and political writings. A popular broadcaster, he served on numerous committees, e.g. Ullswater Committee on broadcasting, 1935; Road Accidents Emergency Council, 1936-41.

**Elul.** The sixth month of the sacred and twelfth month of the civil year of the Jews, corresponding approximately to Aug.-Sept. It is mentioned in the book of Nehemiah. See Calendar.

**Elutriation** (Lat. *elutriare*, to wash out). Process of obtaining mineral substances in a finely powdered condition by diffusing them in water after they have been ground or crushed. In an elutriator the coarser particles rapidly subside, and the water which still holds the finer particles in suspension is decanted into another vessel and the powder allowed to settle. The process is used for obtaining emery of different grades of fineness, for preparing jewellers' rouge, and other fine sizing processes.

**Eluvial Deposits.** Term used in mining geology for natural mineral concentrations formed, without stream action, upon hill slopes as a result of weathering of metalliferous lodes or rocks that outcrop above them. The heavier and more resistant minerals collect just below the primary source; while the lighter minerals are further removed by the action of rain or wind. This type of natural concentration is not so efficient as that brought about by stream action (see Fluvial Deposits); consequently the primary source must generally be fairly rich itself to give rise to economic residuals.

Eltham, Kent. Exterior of the banquet hall of Eltham Palace, said to have been built by Edward IV

The most important eluvial deposits are of gold, tin, and columbite-tantalite. Gold eluvials are found in Australia, New Zealand, East and West Africa, and the U.S.A. Deposits in Malaysia, Belgian Congo, Australia, and Nigeria are notable contributors to the tin production, whilst those of Nigeria contain columbite-tantalite and occasionally smaller amounts of wolfram. Minor deposits of manganese, kyanite, barite, and gemstones may occur as eluvial deposits.

**Elvan.** Term applied by the Cornish miner and quarryman to any hard rock not typically granite. Whereas it generally refers to dykes of quartz- or granite-porphry, hard epidiorite may be called blue elvan. The porphyries of Cornwall are late granitic injections into the main granite, generally in the form of steeply dipping sheet-like bodies many yards in width. Although similar to granite in mineralogy and chemical composition, they have a different texture. They have relatively large crystals of quartz (quartz-porphry) or of the other essential mineral constituents of granite (granite-porphry) set in a fine-grained matrix of quartz, feldspar, and mica.

**Elvas.** Frontier city of Portugal, in Portalegre dist. It stands on an affluent of the Guadiana, 170 m. E. of Lisbon and 10 m. W. of Badajoz, on the Lisbon-Madrid rly. It has a Gothic cathedral, a 15th century aqueduct 4 m. long, a Roman castle, and an arsenal. The manufactures include pottery and brandy. The Roman Alpesa or Helvas and the Moorish Balesh, Elvas is an historic place; it held out against the Spanish in 1658 and 1711, but fell to the French in 1808. Pop. 11,747.

**Elver.** Young eel, the stages of whose life history are described under Eel.

**Elverum.** Town in Norway, at the entrance to the Østerdal, the most eastern of the great Norwegian valleys, and an important junction on the Oslo-Trondhjem rly. On April 11, 1940, King Haakon removed from Hamar to Elverum in face of the German invaders, and a few days later the town was reduced to ruins by

aerial bombardment after his refusal to hand Norway over to German control. King Haakon was not injured, and later escaped to Great Britain, but some of his party were killed by machine-gun fire.

**Elvey, Sir George Job** (1816-93). British organist and composer. Born at Canterbury, March 27,

Sir George Elvey,  
British organist

1816, he became a chorister at the cathedral and a pupil of the organist. He was organist of S. George's chapel, Windsor, 1835-82. He was knighted in 1871, and died Dec. 9, 1893. Elvey's compositions are chiefly church music; he composed the tune of Come, Ye Thankful People.

**Elvey, Maurice** (b. 1887). Professional name of William Seward Folkard, British actor and stage and film director. He was born in Yorkshire, Nov. 11, 1887. In 1912 he was engaged by Granville Barker as stage director in America for the production of Fanny's First Play. He returned to England and devoted himself exclusively to film production (over 150 films after 1918). He was director of productions to

15, 1866, he was educated at the Oratory School, Birmingham, and Christ Church, Oxford. He abandoned a diplomatic career for singing, and appeared as a professional tenor at Kendal in 1903, and in London with the Handel Society. Possessing superb diction, he sang with great success in oratorio, but more especially in *Lieder*. He appeared regularly at promenade concerts and gave recitals with Fanny Davies (*q.v.*) in Germany. He died at Boston, Jan. 12, 1921, as the result of a train accident during a concert tour of the U.S.A. Elwes was commemorated by the foundation of a fund to assist young musicians.

His son Simon (b. June 29, 1902) studied at the Slade School, and became a portrait painter, exhibiting regularly at the R.A.

**Elwes, John** (1714-89). British miser. Born April 7, 1714, son of Robert Meggott, on succeeding to the estate of his uncle, Sir Hervey Elwes, he assumed his name. The estate having been much encumbered, habits of frugality had turned Sir Hervey into a miser, and John Elwes proved an apt pupil. Good-hearted by nature, he was kindly to all but himself. He lent money to fellow members when M.P. for Berkshire, 1772-84. After a life of the utmost penury, he died Nov. 26, 1789. He left over £500,000.

**Ely.** Episcopal city, urban dist., and market town of Cambridgeshire, England. It stands on an eminence on the left bank of the Ouse, in the Isle of Ely—which for some purposes ranks as a separate administrative county, with its own M.P.—16 m. N.N.E. of Cambridge. It is famous for its magnificent cathedral. In 673 Etheldreda founded a monastery here for monks and nuns, and became first abbess. It was destroyed by the Danes in 870, and in 970 was refounded as a monastery by Ethelwold, bishop of Winchester.

The present cathedral was begun by Abbot Simeon in 1083. It embraces every style of architecture from Early Norman to Late Perpendicular. It is 537 ft. long and 189 ft. across the great transepts. The W. portion of the nave and W. tower were added in 1180; the fine Galilee or W. porch was completed about the beginning of the 13th century; the choir was

Ely. Arms of  
the bishop

Elvas. Fortifications of the city defending the Spanish frontier of Portugal

Julius Hagen and president of the British Association of Film Directors. He also made pictures in France, Germany, and Hollywood.

**Elvira, Council or.** Ecclesiastical assembly held at Elvira in Granada, early in the 4th century. It was attended by nineteen bishops, and put forth about eighty canons dealing with church discipline. It forbade the veneration of pictures in churches, ordered attendance at mass on Sundays, and enjoined celibacy on the clergy.

**Elwes, Gervase Cary** (1866-1921). British singer. Born at Billing Hall, Northampton, Nov.

Ely. The cathedral viewed from the west. The 12th century west tower and Galilee porch; to the right, the south-west transept and tower, of Transitional Norman architecture  
*Photochrom*

erected between 1235-52; the beautiful Decorated octagon tower and lantern (170 ft. high), finished in 1328, took the place of the central tower, which collapsed six years earlier; the lady chapel (now the parish church) dates from 1321-49. Since 1845 the edifice has undergone general restoration. Within the cathedral's precincts are the Tudor bishop's palace, the King's School (1541), and a theological college. Ely became a bishopric in 1109. Market day, Thurs. Pop. 8,500.

**Ely**, MARQUESS OF. Irish title borne since 1800 by the family of Loftus. In 1771 Henry Loftus, an Irish landowner, was made earl of Ely, taking his title from Ely in Fermanagh. The title died with him in 1783, but his nephew, Sir Charles Tottenham, Bart., inherited his estates and took the name of Loftus. He was postmaster-general and was made a baron in 1785. Other Irish honours followed, cul-

minating in a marquessate in 1800, the reward for his support of the union of 1801, when he was made a baron of the United Kingdom.

**Elyot**, SIR THOMAS (c. 1490-1546). English diplomatist and scholar. A native of Wiltshire, he was knighted by Henry VIII and sent on several embassies. His most famous work is *The Book named The Governor*, 1531, the first on the subject of education written and printed in the English language (*consult* edn. H. H. S. Croft, 1880). He also compiled a Latin-English dictionary, 1538. He died March 26, 1546.

**Ely Place**. Cul-de-sac near Holborn Circus, London, E.C. It occupies part of the site of Ely House,

the inn or hostel of the bishops of Ely, of which the church of S. Etheldreda, restored to Roman Catholic worship in the 19th century, was the chapel. John of Gaunt died in Ely House in 1399, and Henry VIII is said to have first met Cranmer here. The church, one of the most perfect examples of Decorated architecture in England, has windows E. and W. with exquisite tracery, and an un-restored crypt. Ely House was demolished to the crown under Elizabeth, and transferred to Sir Christopher Hatton.

**Elyria**. City of Ohio, U.S.A., the co. seat of Lorain co. On the Black river, 25 m. W. by S. of Cleveland, it is served by rlys. and an airport. It makes machinery, foundry and machine shop products, steel tubing, air brakes for cars, bicycles, heating and air conditioning units, furniture, leather goods, hosiery, and lace. Settled in 1817, it became a city in 1892. Pop. 25,120.

**Elysée**. Palace in Paris, the official residence of the president of the French republic, in the Faubourg St. Honoré. A garden separates it from the Champs Elysées. It was built in 1718 for the comte d'Evreux, but passed later into royal hands, and was the residence of Madame de Pompadour. Others who lived here included Napoleon I and Napoleon III. After 1870 it became the official residence of the president.

**Elysium** OR THE ELYSIAN FIELDS. In classical mythology, the abode of the souls of the good after death. Some legends make Elysium a part of the underworld, others make it an island or islands in the Atlantic Ocean—the Fortunate Islands or Isles of the Blessed. Elysium is represented as a place of perpetual sunshine with flowery meadows and pleasant streams.

**Elytra** (Gr. *elytron*, covering, sheath). Horny sheaths or cases into which the fore wings have been modified in the beetles and certain other insects. They usually cover the back of the insect, and the hind wings are folded under them. *See* Insects.

**Elze**, FRIEDRICH KARL (1821-89). German student and critic. Born at Dessau, Anhalt, May 22, 1821, he studied at Leipzig and Berlin. Having published a life of Byron (1870), Eng. trans. 1872, and various works on the Elizabethan drama, he was appointed to the chair of English literature at Halle in 1875. His best known work is a biography of William Shakespeare (1876), Eng. trans. 1888. He died at Halle, Jan. 21, 1889.

Sir Thomas Elyot, English diplomatist

*After Holbein*

**Elzevir.** Name of a family of Dutch printers which is given also to some famous books printed by them, e.g. pocket editions of the Greek Testament, Latin and Italian classics, and French memoirs. The firm, founded in Leyden in 1583 by Louis Elzevir (1540-1617), was carried on at Amsterdam by the family, 1638-80, and ended in 1712. The first edition of the Caesar of 1635 is the acknowledged masterpiece in type, ornaments, paper, printing, and purity of text. The publications of the firm dated 1626-1680 are generally the most valuable. More than 150 spurious Elzevirs are known to experts. A fount of type has been given the name Elzevir.

**Emanation** (Lat. *emanare*, to flow out). In philosophy, the theory that all things proceed from a higher original principle (as light from the sun), into which they are again received and absorbed. This form of pantheism, of eastern origin, was adopted by the neo-Platonists and developed by the Gnostics and Cabbalists.

Radium emanation was the name originally given to the inert radio-active gas radon (*q.v.*).

**Emanuel I** (1469-1521). King of Portugal. Born May 31, 1469, he ascended the throne in 1495. He inspired the expeditions of Vasco da Gama, Albuquerque, and Cabral to Brazil, Goa, Malacca, and Sumatra. Under his guidance Portugal became the principal maritime power in the world. He was a persecutor of Jews and a founder of churches and monasteries. He died Dec. 13, 1521.

**Emanuel, Walter Lewis** (1869-1915). British humorous writer. Born April 2, 1869, in London, he was educated at University College School and Heidelberg, and became a solicitor in 1896. In 1902 he began writing for Punch his amusing comment on current news entitled *Charivaria*, which he continued regularly for the rest of his life. He died Aug. 4, 1915. His books included *A Dog Day*, 1902; *The Dogs of War*, 1906; *One Hundred Years Hence*, 1911.

**Emba or Yemba.** Non-navigable river of Kazakh S.S.R., in Uralsk government. It rises in the Mugojar hills and falls into the N.E. of the Caspian Sea after a course of about 300 m.

**Embalming** (Fr. *em*, in; *baume*, Gr. *balsamon*, balm). Art of preserving dead bodies. Among the ancient Egyptians, and possibly the Peruvians, embalming originated in the idea of the resurrection

of the body. Herodotus describes three Egyptian methods. In the most expensive process, after removing the brains and intestines the abdomen was rinsed with palm-

Embalming. Egyptian embalmers at work. (From a relief)

wine and filled with myrrh, cassia, and other perfumes, and the incision in the left flank sewn up. The body was then steeped in natron (native sodium carbonate) for 70 days, washed, and wrapped in gummed linen cloths.

A less expensive method was to inject the body with *Kedria* (cedar pitch) in order to remove the intestines, and then steep it in natron. In embalming the poor the abdomen was rinsed in the substance known as *syrmæa* and the body steeped 70 days in natron. Usually the internal organs were embalmed and placed in jars. The Egyptians also embalmed cats, crocodiles, hawks, and other sacred animals and birds.

The ancient Persians apparently embalmed with wax, the Assyrians with honey, and the Guanches, the aborigines of the Canary Islands, in the Egyptian manner. Embalming has long been practised

in Europe and is fairly common in the U.S.A. A remarkable modern example of the embalmer's craft was that employed in preserving the body of Lenin for perpetual public display in Moscow, which is said to have been by a secret process. See *Burial Customs*.

**Embankment.** Mound of loose material artificially formed, or a bank supported by artificial means. There are (a) embankments formed simply by tipping material and allowing the sides to assume the natural angle of repose of the material of which they consist, as in rly. embankments; (b) reservoir embankments for containing and resisting the pressure of water; (c) embankments of earth or similar material retained, supported, and protected by walls, sheet piling, or other means.

Rly. embankments, for the most part of materials excavated in cuttings, serve to carry a rly. across a valley or depression, to avoid steep gradients; they are also constructed to raise the level of rlys. across wide plains, especially where the soil becomes waterlogged, the necessary materials being obtained by excavating material from borrow pits on either side of the line. When formed along the side of a hill a side excavation is usually made, the excavated material being utilised to form the bank portion, the sloping ground under the bank being first cut into steps to prevent side-slipping of the deposited material. Broken stone, gravel, and good sand are the best materials; wet clay and surface soil are liable to cause trouble and expense, as the initial angle of repose may become much flatter, and slips may occur. An embankment should be made higher than its permanent level to allow for subsidence; the allowance varies from  $\frac{1}{4}$  to  $\frac{1}{2}$  of the height. Tipping should always proceed in a forward direction.

In first-class work the slopes are finally covered with surface soil for a depth of a few inches and either turfed or sown with grass seed, as grass binds the surface and tends to prevent washing away by rain. Embankments in still water should have their slopes pitched with stone; if subject to the action of waves or currents they should consist of rubble or be contained by walls. When the water level is subject to fluctuation, the slopes must be protected to prevent material being washed out as the level of the water falls. When a stream of water is encountered, a drain, culvert, or bridge is inserted,

Embalming. Left, inner and, right, outer bandages wrapped by the ancient Egyptians round an embalmed body or mummy

**Embankment.** 1. Thames Embankment, London, looking E. from Waterloo Bridge. 2. Embankment at Belvide reservoir, Staffordshire. 3. Sectional diagram of Thames Embankment at Lambeth, and, 4, at Chelsea. 5. Embankment on the National Transcontinental Rly. at James Bay, Canada

The angle of repose varies with different materials from  $14^{\circ}$  to  $37^{\circ}$ ; the range for materials usually employed is from  $26^{\circ}$  to  $34^{\circ}$ . Owing to the steeper gradients permissible, road embankments are not often necessary on a big scale, but, where constructed, the same rules apply as to railway embankments.

Reservoir embankments consist of earth or similar material lined inside with concrete or stone and rendered watertight by a vertical wall of clay puddle in the centre of the bank, extending from a foundation of impervious material to well above water level. Such embankments have to sustain the side pressure of the impounded water, and are made with slopes much flatter than the natural angle of repose.

A wharf contained by sheet piling with earth filling, or the protection or reclamation of a foreshore or

riparian land by a wall, may constitute an embankment. The term is popularly applied to riverside constructions whereby the banks are protected and retained by walls and have a road and footwalk sometimes ornamented with gardens.

**Embargo** (Spanish). Term in international law meaning a detention of merchant ships in port. It may be used in time of peace as a reprisal for some injury committed by the state to which the ships belong. A state, when war with another is imminent, may also lay an embargo on the ships of that other in its ports with a view to their seizure and confiscation should war break out. It is doubtful, however, whether such an anticipatory embargo is today recognized by international law.

The term is also used in a wider sense to mean any prohibition.

**Embassy Theatre.** London playhouses situated in Eton Avenue, Swiss Cottage, opened on Sept. 11, 1928, under the management of Herbert Jay and Sybil Arundale (*q.v.*). The first production was *The Yellow Streak*, and over a period of some 10 years a number of the plays performed there were subsequently transferred to West End theatres. The theatre, which has a seating capacity of nearly 700, was damaged by a German bomb in Oct., 1940, and was reopened in Feb., 1945.

**Embattled,** **IMBATTLED,** OR **BATTLED.** In heraldry, a line of division, or outline, showing square projections like the crenellations or embrasures of a castle wall. The term crenellated is sometimes used.

#### **Ember Days.**

In the Anglican and Roman Catholic Churches, fasts of the four seasons. They are the Wednesday, Friday, and Saturday after the 1st Sunday in Lent, Whitsunday, Sept. 14 (Holy Cross Day), and Dec. 13 (feast of S. Lucy). The weeks in which these days occur are called *Ember Weeks*. They were introduced into England by S. Gregory (590-604). Ordinations in the Anglican Church take place on the Sundays following the *Ember Days*, and in the R.C. Church on the Saturdays of the *Ember Weeks*.

**Embezzlement.** In English law, the wrongful appropriation to his own use, by a clerk or servant, of money received by him from his master. It must be distinguished from larceny by a servant. In the latter case the servant steals property which has been in his master's possession; in embezzlement he intercepts it. For example, if a shop assistant receives a shilling for goods sold and simply puts it in his pocket, and does not account for it to his master, it is embezzlement. If he puts it in the till, and then takes it out again and steals it, it is larceny by a servant.

**Emblem** (Gr. *emblēma*, an insertion). Originally meaning an ornament inserted on a mosaic or vase, the term is now generally used for an object or representation symbolic by reason of its connexion with another object, person, or event. It is also used for the marks used by printers to distinguish the work of their press.

In art the emblem has played an important part, especially in the representation of Christian saints, etc. The work of the old masters, and

**Embattled in heraldry**

the pages of old missals, Bibles, etc., are full of such representations. It has been estimated that the emblems of the saints number over 800, or, including variant forms, over 3,000.

Among the commonest are the keys of S. Peter, the sword of S. Paul, the spiked wheel of S. Catherine, the lamb of S. John Baptist, the lion of S. Jerome, the dragon of S. George, the X-shaped cross of S. Andrew, the serpent of S. Patrick, the arrows of S. Sebastian. For the most part these objects are emblematic of the death suffered by the saint, or of miracles attributed to him.

Emblems are also given to various virtues and religious conceptions, e.g. the hand, marked with a cross or sacred heart, is found to stand for labour; a globe, surmounted by a cross and resting on a heart, for the reign of love and concord on earth; a lily for purity and the Virgin Mary. The patriarchs, prophets, and sibyls have their emblems, as Adam with a spade, Moses with the tables of the law, David with harp or sling, or Sibylla Agrippina with a scourge. An early emblem of Christ was a fish, the letters of the Gr. *ichthus*, fish, standing for Jesus Christ Son of God the Saviour. During the 15th century, when heraldry was at its height, armorial bearings incorporating many emblems were devised for almost 100 saints. See Hagiology.

**Emblements.** Term used in English law for the common law right of a tenant whose tenancy is ended otherwise than by his own act to take the crops then growing on the land.

**Embolism** (Gr. *embolos*, stopper, plug). Obstruction of a blood-vessel by material which has been carried along in the blood-stream. The commonest cause of embolism is detachment of a blood-clot or portion of a blood-clot which has formed in a vein. Other substances which may form emboli are portions of growths on the heart-valves resulting from endocarditis, calcareous material from degenerated vessels, pieces of tumours, fat, masses of bacteria, and air bubbles.

Embolism of a coronary artery may cause sudden death; embolism of the brain may lead to paralysis; embolism affecting the main blood supply to a limb leads to sudden pain, swelling, and pulselessness, followed by gangrene in some cases and by recovery in others where other vessels enlarge and replace the blocked circulation. If the embolus contains in-

fective micro-organisms, as, for instance, when it has been broken off from a septic clot, the result is often to set up an abscess where it lodges. Air may accidentally find entrance into the blood-stream during operations involving the large veins of the neck or uterus. When the air bubbles reach the heart they cause an air lock and sudden death.

**Embracery.** In English law, an attempt, whether successful or not, to influence a jury in favour of one party to a trial, whether by promise, persuasion, monetary bribery, treating, or the like. The person who attempts to so influence a jury is called an embracery; and the same term is applied to one who comes into court to overawe a jury, or for reward, and speaks in favour of one party. It is a misdemeanour punishable by fine and imprisonment. The word is derived from old Fr. *embracer* (mod. *embraser*), to set on fire, excite; to embrace, meaning to clasp in the arms, is from Fr. *em*, in; *bras*, arm (Lat. *bracchium*).

**Embroidery.** Art of decorating fabric by means of needle and thread. Its practice is of great antiquity; there are references to it in the description of the Tabernacle, and Ezekiel (27, v. 7) mentions "fine linen with brodered work from Egypt." Phrygia and ancient Babylon were renowned for their embroideries. The art was also well known in ancient Greece. In Christian times embroidery became the handmaid of the church. Some vestments still existing at Arles, France, date

from the 6th century. A very beautiful dalmatic in the Vatican, once reputed to be that of Charlemagne, is now attributed to the 11th century. A mediæval embroidery that stands alone is the Bayeux Tapestry (q.v.).

In the 13th century English embroideries were without equal, and "Opus Anglicanum" was eagerly sought. Examples of magnificent early English coopes are exhibited in Ascoli-Piceno, Pienza, Anagni, Madrid, Toledo, S. Kensington, and elsewhere. French and German embroidery reached a high pitch of excellence during the 13th and 14th centuries, as also did that of the Italian workshops in Milan and Florence.

In W. Europe, in the 16th century, embroidery was both a professional and an amateur handicraft. Elaborate embroidery was used for secular dresses and furniture, and panels and cushions were decorated with cross-stitch or *petit point*. Some magnificent bed-curtains ornamented with trees and large leaves full of elaborate detail were made in the Jacobean period, while embroideries of Charles I's time are characterised by the highly raised style aptly known as stump work. Simplicity marked the early 18th century embroidery, with its powderings of natural flowers worked in chain-stitch on a light ground, and many beautiful samplers of the period yet remain. Under the Hanoverian kings, the highly ornate dress afforded many opportunities for the art of the needle, and the upholstered chairs were covered

Embroidery. Stitches in common use. 1. Buttonhole. 2. Long and short stitches. 3 and 4. Satin. 5. Chain. 6. Eastern or Oriental. 7. Back stitch. 8. Working diagram of cut work shown complete in 9.

with cross- and tent-stitch work. Later the art sank low; copies in embroidery of black-and-white prints and of paintings became the fashion. In the second half of the 19th century the Pre-Raphaelite movement, the revelation of Japanese art, and the study of Eastern examples brought about a change of taste and an improvement in the style of embroidery.

Modern embroidery can be divided into two sections: machine embroidery and hand embroidery. Machine work is used principally for the adornment of dresses, lingerie, millinery, and furnishings. Various embroidery machines have been invented, the most popular being the single-needle type, similar to the ordinary sewing-machine. The first successful machine, invented by Josué Heilmann of Mulhausen, was patented in England in 1829. On this machine it is possible for one person to guide from 80 to 140 needles working simultaneously and producing repeats of the one design. The Bonnaz machine, patented in Great Britain in 1868, does chain-stitch, braiding, and cording. As modified by M. E. Cornelly, it does in addition gimp and retard stitch.

Hand embroidery is of many different kinds. In appliqué work, one material is applied to another by means of fancy stitchery. There are two forms of this work, onlay and inlay. Assisi embroidery is a variation of cross-stitch embroidery; the design is outlined and the background is filled with crosses. Cross-stitch, tent-stitch, *petit point*, and *gros point* are usually worked on canvas.

Cut-work or Swiss embroidery, with open groundings such as Madeira, Renaissance, Richelieu, and Venetian embroidery, is used on fine cambric and linen. Drawn-thread work and needleweaving are of peasant origin; the threads of either the warp (or the weft) of the material are drawn, and the weft (or warp) threads are worked into a pattern. Florentine embroidery, of Italian origin, is composed of vertical zigzag lines of shaded stitches. Hardanger embroidery, the famous embroidery of Norway, is a mixture of satin-stitch and drawn-thread work. Jacobean embroidery is worked in wools, usually on stout twilled fabric suitable for panels and furnishings. This design gives scope for various fillings and shades of wool.

Metal-thread embroidery, used in the 17th and 18th centuries for the decoration of ecclesiastical

ornaments and vestments, now appears on official costumes and civil and military badges. The term *passementerie* covers the making of cords, fringes, tassels, and buttons for the trimming of dresses and for furnishings. Tambour or Luneville work—the attaching of beads, bugles, and sequins to materials by means of a hook—is done on an embroidery frame.

In quilting, two or three layers of material are held together by stitching in a decorative design. There are two kinds, English and Italian, the latter having a cord or wool inserted in the design to produce a pattern in relief. In England and Wales, quilting remains a national art.

Smocking is a method of gathering a width of material into regular folds which are secured by decorative stitchery. This is of peasant origin, and many beautiful specimens can be seen on Hungarian national costumes.

The names of the principal stitches used in hand embroidery are: stem, back, split, chain, cable, couching, herringbone, fishbone, buttonhole, satin, daisy, long and short, French knot, darning. See Needlework.

**Embrun.** Town of France. It stands above the Durance in the department of Hautes Alpes, being nearly 3,000 ft. high, 27 m. by rly. S.S.W. of Briançon. Although a small place it has much historic interest. It was once the seat of an archbishop, and its magnificent cathedral, built in the 12th century, remains. Dedicated to Notre Dame, this has a fine tower. The palace of the archbishops is now used for public purposes, and there is an old tower, a relic of the fortifications which were pulled down in 1884. Pilgrims visited Embrun in the Middle Ages to venerate a picture of the Madonna painted on the cathedral door. A large Roman station, the place became a bishopric soon after 300. The bishops (later archbishops) were princes of the Empire and rulers of an extensive territory. The see was transferred to Gap in 1791.

**Embryo** (Gr. *en*, in; *bryein*, to swell, teem with). In a general sense, an undeveloped idea or conception, the initial stage of anything. In biology it is the living creature which develops in the egg or womb; in botany, that part of the seed from which the plant is formed.

## EMBRYOLOGY: STUDY OF THE EMBRYO

Comyns J. A. Berkeley, Lecturer in Biology, Chelsea Polytechnic

*This article explains the scope of Embryology, which studies the development of the individual in its early stages, before it has become recognizable for what it will be, except to the expert. See also Biology; Eugenics; Evolution, Life, etc., and biographies of Darwin, Lamarck, Mendel, etc.*

Embryology (Gr. *embryon*, embryo; *logos*, science) is the science of the development of the individual in its early stages. This process starts in a single cell and is accomplished by the multiplication of that cell together with the growth and differentiation of the products of division till ultimately the complex structure of the young organism is apparent. In typical instances the single initial cell is the result of the union of two gametes, which in all but the simplest organisms differ. One, the female gamete, is relatively large and non-motile, the other, the male gamete, is relatively small and usually motile. It is the fusion of these two cells, fertilisation, which normally sets in motion the processes of embryo building.

**ANIMAL EMBRYOLOGY.** The egg cell or ovum. In most animals, egg cells are formed by the multiplication of primordial germ cells within the ovary of the parent. Some of the products of this multiplication ultimately become eggs (see Gametogenesis); but it frequently happens that a developing egg absorbs its sister cells or that they form a protective covering (follicle cells) for it. Thus, in the ovary of the fresh water polyp, hydra, and the marine tubularia, one egg only of the original many survives. A ripe egg is almost without exception spherical, or nearly so, and contains one haploid (*q.v.*) nucleus. It is large relative to most body cells owing to the accumulation within it as it develops of food reserve or yolk. The quantity of

Embryology. Hen's egg shown in section

this varies as does the size of the egg, which is about 1.6 mm. in diameter in the case of the frog, 1.7 mm. in man, and 0.06 mm. in the mouse.

Around the egg are eventually formed envelopes of various kinds which are derived from the egg itself, the follicle cells, or from secretions of the oviduct. What is normally called a bird's egg consists of the egg cell enormously dilated with yolk, surrounded in turn with a follicular envelope, a large amount of albumen (or white of egg), a thin shell membrane, and a porous shell.

**Spermatozoa.** Primordial germ cells multiply in the male organs to form numerous haploid spermatids which change their shape to become spermatozoa. These are extremely minute and typically consist of a head, chiefly nuclear, and a tail, by which the cell propels itself through liquid, sometimes a simple lash but frequently having a fin of cytoplasm running down most of its length. Its total length varies considerably in different species, being 50–60 microns in man, 20–27 microns in the crocodile, and in siredon some 360–430 microns. Differences occur in detailed structure, and some sperms have no tail.

**Fertilisation.** Contact between the two gametes is normally effected by the movement of the male gamete, which pierces the egg with its head. Thereafter, movement of fluid in the egg cytoplasm seems, in some instances at least, to carry the sperm inwards till it is in a position to unite with the egg nucleus. When this has occurred fertilisation is complete, and it results in (a) a change in the surface of the egg which inhibits the entrance of further sperms, (b) a mingling of the heritable material of the two gametes with the consequent formation of a diploid

nucleus for dividing to form the body cells of the new animal, and (c) a stimulus to the egg to divide.

**Embryo development.** *Segmentation.* Soon after fertilisation has occurred the egg cell nucleus divides, and the rest of the cell follows suit. The process is repeated, the two cells resulting from the first division dividing to form four cells, the four to form eight, and so on. Eventually many cells or blastomeres are produced by this process of segmentation, which differs in detail according to the amount and distribution of yolk

the other. The result is to produce at first a ball of cells, which may be solid (morula stage), or may develop an internal cavity as it forms. Such a cavity or blastocoel is seen at the blastula stage in the frog embryo. Here it is floored by a hemispherical mass of larger yolky cells and roofed by a hemispherical dome of smaller cells. Alternatively, when yolk is abundant, as it is in birds, reptiles, and fishes, cell divisions may take place at first at one side of the egg only to produce there a plate of cells, or blastoderm, lying on the yolk.

**Formation of germinal layers.** In the developing embryo, be it of the blastula or blastoderm type, there are soon apparent groups of cells from which definite kinds of tissues and organs arise. These groups of cells are the germinal layers. In sponges and stinging animals, there are two fundamental cell groups

which become apparent as the two layers of the wall of

the gastrula, formed as if by the in-dimpling of one side of a blastula till that side makes contact with the other. The outer layer is the ectoderm, the inner the endoderm. A third layer or mesoderm is formed in vertebrates and in these the endoderm and ectoderm are established in a somewhat different manner. In the frog some of the smaller cells of the blastula, close to the yolk cells, tuck themselves in so that there is formed a lip overhanging the yolk cells. It is as if the skin of a soft toy balloon had been pinched to bring the inside of one part into contact with the inside of a neighbouring one. This process of intucking is progressive, but for simplicity it may be imagined that the two layered lip which is thus formed

Embryology. Spermatozoon of man.  
Above, that of a horse

in the eggs. The whole egg, when it contains relatively little yolk uniformly distributed, may be involved and the cells formed all of a size, as in the sea urchin; or, when scanty yolk preponderates on one side of the egg, as it does in that of the frog, divisions may be unequal to give larger cells on the yolk side than on

Embryology. Sectional view of the embryo of a frog, illustrating how the brain, spinal cord, vertebrae, and alimentary canal are among the earliest parts of the developing animal to form

grows downwards and round the yolk and concurrently spreads sideways to become crescentic, semi-circular, and even more curved, till finally its corners meet and the lip forms a circular aperture. It is only within this aperture or blastopore that the main mass of the yolk cells is now exposed. Elsewhere it is completely covered by two layers of cells, ectoderm outside and endoderm inside, initiated by the lip. The process of envelopment has resulted in a new cavity. This is the archenteron and corresponds with the future alimentary canal. Between the endoderm and the ectoderm the mesoderm appears later.

In those embryos where segmentation leads to a plate of cells at one side of a large yolked egg, a lip develops in a somewhat similar fashion, either at the edge of the blastoderm or within it, and initiates germinal layers, an archenteron being less well developed in the higher forms.

**Differentiation.** When the germinal layers are established, the structure of the individual cells is simple; but thereafter changes in the form of cells and in their arrangement lead to the initiation of tissues and organs. Certain groups of cells and organs of the mature organism are regularly traceable to one or other of the germinal layers. Thus, the ectoderm regularly gives rise to the skin and the nervous system, the endoderm to the alimentary canal, lungs and liver, and the mesoderm to the skeleton, muscles, and vascular system.

**Foetal membranes.** As the embryo develops on one side of the egg from the blastoderm, this spreads, tending to enclose the yolk. In some instances, *e.g.* in fishes, enclosure occurs and there is thus formed a closed yolk sac attached to the ventral side of the embryo with its cavity continuous with that within the embryo itself. During the embryology of the more highly evolved vertebrates, membranes in addition to the yolk sac are derived from the extra-embryonic parts of the blastodisc. In birds, for example, the central region of the blastodisc only grows into the embryo. The marginal parts enfold the embryo in a two-walled, fluid-filled sac which serves as a water bath and cushion for it. The wall of the sac next the embryo is the amnion, and its inturned neck is joined to the edge of an aperture or umbilicus in the ventral side of the embryo. The outer wall of the sac is the false amnion or

chorion. Its neck may be considered as united with the edge of an uncompleted yolk sac, and by means of this joined through the umbilicus into the ventral side of the embryo also. Between the insertions of the amnion and the yolk sac, part of the developing hind gut of the embryo protrudes to form yet another sac, the allantois, which may enlarge until it completely fills the space between the amnion and the chorion.

**Placenta.** In placental mammals, the fertilised egg divides to form a morula. The surface layer of this separates, in the blastocyst stage, as the false amnion, from the inner mass or embryonic knob. Part of the false amnion becomes attached to the lining of the female parental uterus as a trophoblast (nutritional sac) to initiate the placenta, and the embryonic knob develops into the embryo with its amnion, yolk sac, and allantois. Parts of these become intimately associated with the false amnion and the uterine wall in the developing placenta to which the embryo is attached by their connexions (umbilical cord) with its umbilicus, the allantois ultimately forming the principal placental union.

**PLANT EMBRYOLOGY.** *The Egg cell or Oosphere.* In relatively simple plants, oospheres are formed in oogonia, which are simple sacs, and the egg cell contains food reserve sufficient for its early post-fertilisation development. This process, however, usually results in a young independent plant without the intermediate formation of any recognizably peculiar embryonic stage. In the more complicated plants, egg cells are differentiated from among a number of other haploid (*g.v.*) cells constituting the gametophyte (*see* Alternation of Generation; Reproduction). During this differentiation, cells of similar origin may become specialised as archegonium wall cells, to contain the egg, or as canal cells of archegonium, or synergidae of embryo-sac, to facilitate the access of the male gamete. In such plants, material for embryo growth is supplied by the gametophyte, or, when this is scantily developed as it is in flowering plants, from the parent sporophyte direct.

**Male gametes.** These, like oospheres, are specialised gametophytic cells. Like the sperms of animals, they consist mainly of nuclear material. In most plants which form archegonia, the male gametes are antherozoids, formed in antheridia, and are motile by

means of cilia or flagella. Such motor organs are lacking in all but a few gymnosperms and in all angiosperms. The male cells of these plants are formed as the pollen germinates and are carried along in the cytoplasm of the pollen tube as it grows.

**Fertilisation.** Many antherozoids are known to exhibit chemotaxis (*g.v.*) and reach the oospheres by swimming through water to the neck of the archegonium, burst open in most instances by the conversion of the canal cells into mucilage through which entrance to the egg cell can be accomplished. Male cells of most gymnosperms and all angiosperms are conveyed to the eggs by the growth of pollen tubes which are guided by chemotropism into the necks of archegonia or between synergids. In all typical instances, fusion of the nuclei of male and female gametes initiates embryo development but, in angiosperms, a second nuclear fusion occurs, between a second male nucleus from the pollen tube and two polar nuclei, present in the embryo-sac cytoplasm, to produce the primary endosperm nucleus. From this there is later formed a triploid tissue, endosperm, peculiar to angiosperms, which may persist as a food reserve for the use of the embryo when the seed germinates.

**Embryo development.** In pteridophytes (fern-like plants) the oospore (fertilised egg) is contained in the venter of an archegonium projecting from the surface of the gametophyte plant. In some the oospore divides by a "basal" wall to form the first two cells of the embryo. Each of these cells

Embryology. Drawing of an embryo of *Adiantum* as seen from one side: bw, basal wall; st, stem apex; l, leaf apex; t, foot; r, root

divides again twice by walls at right angles to the basal wall and to one another so that there is produced a ball of eight cells—octants. Each of the octants divides repeatedly and during these divisions a

stem apex is initiated close to the intersection of the third and fourth walls with the surface of the embryo. This stem apex may be initially directed, according to the orientation of the basal wall, away from the prothallus (*e.g.* *Equisetum*) or obliquely sideways (*e.g.* leptosporangiate ferns) or towards the prothallus (*e.g.* *Marattiaceae*).

**Suspensor and foot.** In other pteridophytes (*e.g.* *Lycopods*), the first wall dividing the oospore, laid down usually at right angles to the axis of the archegonium, separates an outer "suspensor" cell from an inner embryo cell. The former by its enlargement serves solely to thrust the embryo cell into the nourishing prothallus: the latter undergoes further divisions to form octants, and later a stem apex, as in the instances already described. Whether or not a suspensor is formed, the young embryo develops in intimate association with the prothallial cells, and as it does so, part of it may become a mass of cells, called a foot, especially adapted to absorb nourishment from them. Near the stem apex a rudimentary leaf or cotyledon is formed which later grows upwards to expand its lamina in the light for photosynthesis, and between the cotyledon and any foot which may arise a root apex is established

Embryology. *Adiantum capillus veneris*, longitudinal section through prothallus, p, p, and young fern, f; r, rhizoids; a, archegonia of prothallus; f, foot; l, first leaf; w, first root of embryo

which grows into the soil as the first root. As soon as the cotyledon and the root are functioning adequately, the young plant is independent of the prothallus, which shrivels.

**Proembryo.** In seed plants the oospore divides to form a proembryo, only part of which is concerned in the production of the embryo proper. In the cycads the proembryo is an extensive tissue formed by free cell formation from the whole egg, but in the conifers it consists of relatively few cells, in the pines being derived from one end of the egg only. In most gymnosperms a middle portion of the proembryo elongates considerably as a suspensor to carry the

apical embryo cells deep into the female prothallus which constitutes the main bulk of the developing seed. Multiplication of embryo cells subsequently results in the embryo proper with its radicle directed towards the suspensor and its plumule or leading bud pointing in the opposite direction and surrounded by two or more cotyledons. Such embryos embedded in female prothallus and surrounded by seed coats remain dormant until the seed is dispersed and until, conditions being suitable, they continue their development into seedlings during germination.

**Endosperm.** In angiosperms the egg cell occupies a position at the micropylar end of the embryosac of the ovule. This sac also contains its own cytoplasm in which are two polar nuclei. Fertilisation is a two-fold process. Two male nuclei emanating from the pollen grain are concerned. One fuses with the oosphere nucleus and the other with the two polar nuclei. From the fertilised egg there is formed a proembryo, a thread of cells which comes to project into the middle of the embryosac. The innermost cell of this row is chiefly responsible for the formation of the embryo, which thus begins its development in the cavity of the embryosac. The remainder of the proembryo is the suspensor, and shrivels as the embryo completes its development.

While these changes are taking place in the oospore, the primary endosperm nucleus divides to produce many nuclei that are centres for the organization of endosperm cells within the embryosac wall. These cells tend to increase in number so as to encroach on the embryosac cavity within, and the nucellus of the ovule without, the measure of the inward encroachment accomplished depending to a degree on the relative speeds with which the embryo and the endosperm grow.<sup>3</sup> Should the embryo develop relatively slowly prior to seed dispersal, it may, at that time, be a mass of meristem cells either in the form of an undifferentiated plug or showing differentiation of radicle, one or two cotyledons, and perhaps a plumule, embedded in endosperm tissue whose substance

is absorbed during germination. Alternatively, with relatively more rapid development some part of the embryo such as the cotyledons or the hypocotyledon stem may absorb the endosperm-forming substance as it comes into the embryosac from without, the embryo cells maturing accordingly, and the seed coming to contain no endosperm when it is ripe.

Driesch, 1908; Experimental Embryology, J. W. Jenkinson, 1909; Textbook of Embryology, ed. W. Heape, 1914, etc.; Heredity and Environment in the Development of Man, E. G. Conklin, 2nd ed. 1916; Vertebrate Embryology, J. W. Jenkinson, 1925; Embryos and Ancestors, De Beer, 1940; Ourselves Unborn, G. W. Corner, 1944; Human Embryology, W. J. Hamilton, J. D. Boyd, and H. W. Mossman, 1945.

**Emden.** Town and seaport of N.W. Germany, in the Hanoverian part of the new Niedersachsen state. It stands at the N. of the Dortmund-Ems Canal which links the Ruhr with the sea. This port was the fourth largest in Germany, with an average peace-time turnover of more than 20,000 vessels. Ruhr coal, Swedish iron ore, grain, timber, and fish were the main goods passing through. Fish curing and trade based on the surrounding agriculture and cattle breeding were other concerns. Under the Nazi regime Emden was developed for war purposes, and a submarine base and yards were created, which attracted heavy air attacks during the Second Great War.

The town itself, the central parts of which preserved with their canals and gabled houses a Dutch character, was founded in the 10th century, was given urban rights in the 14th, and became wealthy. In 1402 it fell to Hamburg. It was a free city of the Empire under Dutch protection in 1595, having benefited from the transfer of English warehouses from Antwerp to Emden. Part of Prussia from 1744, it was made a free port by Frederick the Great. After suffering from blockade during the Napoleonic wars, it belonged to Hanover 1815-66, and then reverted to Prussia. A fine town hall in Flemish style (1576), and the Great Church (12th century), were both wrecked in the Second Great War. The town was occupied by the 3rd Canadian div. on May 7, 1945. Pop. 34,111.

Young embryo of shepherd's purse at end of suspensor

**Emden.** Name of a series of German light cruisers. The first, of 3,600 tons, launched in 1908, became famous at the outbreak of the First Great War for the damage she did to British and Allied commerce and for the humanity shown by her commander, von Müller, to the crews of the ships he sank. The Australian cruiser Sydney, learning that the Emden was at Cocos Island, drove her ashore on North Keeling Island and destroyed her with a loss of 230 on Nov. 9, 1914. Müller was saved and allowed to retain his sword. This was the first action by a ship of the Australian navy.

Another Emden was built in 1915, was surrendered to the Allies after the armistice, and in 1920 was allotted to France. A third, completed at Wilhelmshaven in 1925, was one of the earliest units of the new German navy. She displaced 5,400 tons on a length of 508 ft., had eight 5.9-in. guns, and could sail at 29 knots. She was used as a cadet training ship, but going into action in the Second Great War was rendered useless by a Norwegian minelayer on April 10, 1940.

**Emerald** (Gr. *smaragdos*, Fr. *émeraude*, Span. *esmeralda*). Green variety of mineral beryl, a metasillate of beryllium and aluminium with traces of chromic oxide, found in granitic or schistose rocks, and in veins traversing them, also in bituminous limestone (Colombia). It crystallises in hexagonal system, and forms long six-sided prisms; it is valued as a gem-stone when clear and well coloured. Perfect crystals are rare; many stones show "mossiness" due to tiny fissures and air bubbles, while the colour is often irregularly distributed. Emeralds of antiquity came from Egypt; its mines, reopened in the 19th century, yield handsome stones, though generally small and rather pale. The finest crystals come from S. America, chiefly Colombia, and from the Urals; a few are found in Austria, Australia, and the U.S.A.

Certain other stones are known as emeralds. The rare "oriental" emeralds are green corundum; "Brazilian" are green tourmaline; "Uralian" are green garnet; "evening emeralds" are bottle-green olivine; "false" are fluorite; while "mother of emerald" is green quartz, and "emerald copper" is diopase (a green silicate of copper).

Artificial emeralds are made by fusing together 4,608 parts of

strass, 42 parts of copper oxide, and 2 parts of chromic oxide. A finer quality, known as "synthetic" or "scientific" emeralds contains 7-8 p.c. of beryllia, but although almost identical, these are of lower specific gravity and refractivity than the true stones, and are almost always "cloudy" or "mossy." "Emeraldines" are artificially coloured chalcedony.

**Emerald Green.** Name applied to certain green colouring matters. The two mineral emerald greens are aceto-arsenite of copper and hydrated chromium sesquioxide. The aniline dye emerald green is prepared by the action of benzaldehyde upon diethylaniline, and subsequent oxidation.

**Emergency Powers Acts.** British Acts of parliament providing for special administration in time of emergency. An Act of 1920 gave the king power to declare a state of emergency, and the govt. power to deal with it, should action be taken or threatened calculated to deprive the community of the essentials of life. Such a state of emergency was declared in 1926 (see General Strike), and in 1949 during an unofficial strike of London dockers. Under the Emergency Powers Act, Aug. 24, 1939, Defence Regulations (*q.v.*) were issued during the Second Great War.

**Emerson, RALPH WALDO** (1803-82). American poet, essayist, and philosopher. He was born at Boston, Mass., May 25, 1803, the son of a Unitarian minister, and was educated at the Boston Latin school and Harvard. After graduating in 1821, he spent three years in teaching, and then, having entered the Unitarian

ministry, was appointed joint minister of the Second Church in Boston, 1829. He married Ellen Louisa Tucker, who died in 1832, and in that year resigned his ministry in consequence of his widened views, to which he had given expression in a sermon on the Lord's Supper (Works, vol. xi, 7), which did not meet with the approval of his congregation.

In 1833 Emerson travelled in Europe, visited Carlyle, and began that lifelong friendship with him which bore literary fruit in a notable collection of letters. On returning to America he settled at Concord, Mass., and entered upon his career as writer and lecturer, which, in a few years, was to place him in the front rank of American men of letters. The year after settling in Concord, he married Lydia Jackson (1802-92). In 1836 he published a slim volume, *Nature*, in which he briefly stated the case for a new outlook on things in place of the continued acceptance of mere tradition. In subsequent addresses, lectures, and essays, the thoughts enunciated in *Nature* were enlarged upon and developed. In 1840 he commenced writing for *The Dial*, and edited it for two years; this magazine came to be regarded as the special organ of the New England Transcendental movement in religion, literature, and philosophy.

The first volume of those essays by which he was to become most widely famous was published in 1841; a second followed three years later. In 1847 the first collection of his poems was published, and in the autumn he revisited England on a lecturing tour, delivering a series of addresses on Representative Men—Plato, Swedenborg, Montaigne, Shakespeare, Napoleon, and Goethe. The volume containing these addresses was published in 1850. In 1856 the fruits of his observation during his extended stay in England were embodied in *English Traits*.

Writing and lecturing, he came to take a high position as the chief leader of American thought of his generation, and, despite some unfavourable comment on his somewhat staccato literary style, to be recognized in England as a great, suggestive, and stimulating writer. In 1872, his house at Concord was partly destroyed by fire, a disaster which caused him a severe shock; it was, however, rebuilt by his friends and admirers, and he sought health by revisiting Europe. He died at Concord,

*R. W. Emerson*

where his house still stands, on April 27, 1882, and is buried in its famous cemetery of Sleepy Hollow.

The work which Emerson left, alike in prose and in poetry, is peculiarly individual. He was, perhaps, essentially a poet, but only in a small degree a singer; his verse, often marked with penetrating thought and lofty conception, is, for the most part, lacking in beauty of form or music. His philosophy is that of the moment's consideration rather than of any fully developed scheme; is, indeed, the philosophy of the poet rather than of the scientist. Less as master of any definite course of philosophy than as a stimulator of thought along idealistic and optimistic lines did he exercise great influence on his time. His position in this respect is perhaps best summed up in the words of Richard Garnett: "More than any of the other great writers of the age he is a Voice. He is almost impersonal. He is pure from the taint of sect, clique, or party. He does not argue, but announces; he speaks when the spirit moves him, but not longer. Better than any contemporary, he exhibits the enigma how Confucius and Buddha and Socrates and greater teachers still should have produced such marvellous effects by mere oral utterance." The effect of his work, it has been said, is that of good and stimulating conversation; but it is conversation on a high and impersonal plane. His utterance has something of a finely-balanced sanity, and though at times it may suggest the mystic, it is the mysticism of a glorified common sense, not that of mere nebulousness.

Emerson. The old manse at Concord, Massachusetts, where Emerson settled in 1833, and where Nathaniel Hawthorne lived during 1842-46

as black granular masses found in crystalline limestones or aluminous sediments as the result of metamorphism, or in residual deposits concentrated during the weathering of such rocks. The chief deposits occur in Naxos, Greek Archipelago; Aidin, Asiatic Turkey; and the Central Urals, U.S.S.R.

The toughness and hardness of emery make it a good abrasive and it is used in the manufacture of paper, cloth, and wheels. Emery wheels were once much used for grinding, but have largely given place to such artificial compounds as carborundum (*q.v.*) or aluminium oxide, bonded and made into grinding stones and wheels. Emery paper and emery cloth, coated with emery powder, are used for cleaning and finishing metalwork; emery powder as an abrasive in domestic and industrial work. In all these fields the newer abrasives mentioned are taking the place of natural emery. See Grinding.

**Emery, WINIFRED** (1862-1924). Stage name of Isobel Winifred Maud Emery Maude, British actress. Born at Manchester, Aug. 1, 1862, in 1888 she married Cyril Maude (*q.v.*). Her first appearance on the stage was at The Amphitheatre, Liverpool, 1870, as Geraldine in *The Green Bushes*; her first London appearance was in pantomime at The Princess's, 1874. A versatile actress, she appeared with Wilson Barrett, Comyns Carr, Forbes Robertson, and Beerbohm Tree. She accompanied Henry Irving to the U.S.A. in 1884 and 1887-88. She died July 15, 1924.

**Emetic** (Gr. *emetikos*). Substance administered medically to cause vomiting. Emetics are occasionally used in cases of simple illness. Dyspepsia and sick headache caused by excessive eating

may sometimes be relieved by emptying the stomach of its contents. Another use is in conditions of difficulty of breathing caused by bronchitis, especially in children, the act of vomiting stimulating the respiratory mechanism and relieving the distress.

The chief use of emetics is to remove poison from the stomach. This form of treatment may be adopted with safety in almost all cases where poison has been swallowed, except poisoning from strong mineral acids which corrode the stomach wall and render violent movement of the organ undesirable. Some knowledge of emetics should be possessed by every household, for the prompt administration of an emetic may avert serious symptoms, and even save life which would be lost if treatment were delayed. The simplest emetics are a tablespoonful of mustard, or one or two tablespoonfuls of salt, in a tumbler of warm water. The following emetics should be taken only under medical advice.

Zinc sulphate: 10 to 30 grs. dissolved in half a tumbler of warm water, repeated if necessary. Ammonium carbonate: 15 to 30 grs. dissolved in warm water. Ipecacuanha: four to six drams of the wine, or 20 to 30 grs. of the powdered root.

Apomorphine is best administered hypodermically in doses of  $\frac{1}{16}$  gr. This emetic stimulates the nerve centre in the brain which controls the process of vomiting; it is particularly useful in poisoning by narcotics such as opium.

**Emetine**. Chief alkaloid found in the roots of ipecacuanha (*Cephaelis Ipecacuanha*). It is extracted from finely-powdered root by means of alcohol or other solvent to remove the total alkaloids. The solution is then extracted with dilute hydrochloric acid, which in turn is extracted with ether after adding ammonia. The ethereal solution is extracted with sodium hydroxide and concentrated. The residue is converted into hydrochloride, hydrobromide, or hydriodide, whereupon the emetine salt crystallises out. Emetine may also be obtained by the methylation of cephaeline, another alkaloid of ipecacuanha. It is a violent emetic, but in medicine is considered a specific remedy for amoebic dysentery.

**Emigration** (Latin *e*, from; *migrare*, to change one's residence). Systematic migration of the surplus population of one land to another for the purpose of per-

#### Walter Jerrold

**Bibliography.** Works, centenary ed., 12 vols., 1903-15; Letters, ed. R. L. Rusk, 1939; Lives, O. W. Holmes, 1885; J. E. Cabot, 1887; R. Garnett, 1887; D. J. Snider, 1925; R. Michaud, Eng. trans. George Boas, 1930; Van Wyck Brooks, 1934.

**Emery** (Sp. *esmeril*). Mineral composed of corundum (aluminium oxide) with much iron present, mainly as admixed iron minerals, *e.g.* magnetite. It is therefore not properly a true mineralogical variety. It occurs

manent settlement. This movement has been one of the great factors in shaping the world, more potent even than military conquest. The ancient world witnessed vast migrations of people in quest of food and living space and under the pressure of climatic changes: such was the Teutonic surge westwards over Europe to the Atlantic border. The dispersal of the Jews, especially after the destruction of Jerusalem, was a migratory movement of a different kind.

After the discovery of America, emigration developed contemporaneously with the era of the merchant adventurers. Spain led the way, absorbing enormous areas in S. America and in the southern half of N. America. Portugal and Holland played a part, but Spain's main rivals were France and Great Britain. The enterprise of the merchants of Bristol gained a foothold in Newfoundland from which the British people spread to the Pacific in the W. and Mexico in the S. Everywhere, but especially in N. America, French and British found themselves rivals in the race for new lands.

Religion played a large part in the first emigration movements. Zeal for the Catholic Church led Spain to attempt to establish on a large scale model Catholic nations in S. America. The effort to create new peoples to overcome the growing heresies of Europe influenced the French kings in their pious endeavours to build up New France along the banks of the St. Lawrence. The departure of the Pilgrim Fathers from Plymouth in 1620 for New England laid the foundations of the U.S.A. A second great impelling force was poverty; and a third political discontent. The most marked example of these was the steady exodus of the Irish people to America during the famines and troubles of the 19th century. A fourth cause is love of adventure and ambition, of which the most striking instance is to be found in emigration from Britain.

As Spain and Portugal declined, the outflow of their peoples ceased. The Dutch settlers in N. America were gradually absorbed by their English-speaking rivals. S. Africa remains the outstanding example of successful Dutch settlement. The people of France, defeated in their struggle for supremacy in N. America after the Seven Years' War, became one of the least migratory nations in Europe, but the province of Quebec still re-

mains distinctively French under the British flag. Britain maintained the outpouring of her people. While she lost political control of a large part of N. America, the U.S.A. retained the English language, and the British stock predominated. The convict settlements of New South Wales and Tasmania gave way to the free British commonwealth of Australia. The growth of Australia and the opening up of the Pacific coast of N. America were enormously stimulated by the discovery of gold in California and Victoria in the middle of the 19th century.

The defeat of the liberal movement and the triumph of imperialism in Germany stimulated a German migration westwards, which militarism and poverty did much to encourage. The German emigrants before the First Great War went mostly to the U.S.A. and to S. America. After the war their migration to the U.S.A. was checked, and they tended to go in larger numbers to S. America, Poland, and W. Russia.

Abundant industrial openings and high wages in the U.S.A. made it the Mecca of the European emigrant. The flow of population across the Atlantic early in the 20th century averaged 1,000,000 a year; three-quarters came from Russia, Italy, and Austria-Hungary. By 1938 the net inflow was down to 30,000. Despite the immigration from Continental Europe, the most considerable section of the foreign white stock in the U.S.A. is from the British Isles. Canada failed to draw any considerable number of new settlers until near the close of the 19th century. Then, partly on account of the closer settlement and growing scarcity of land in the U.S.A., a big movement, largely of farmers, started from there into the prairie provinces.

One of the most significant movements of emigrants during 1920-40 was the large Japanese emigration all over the Pacific coast and islands due to the rapid growth of Japanese populations. This gave rise to serious difficulties with the white nations of the Pacific, more particularly with the people of California, who caused deep offence in Japan by passing exclusive legislation. A similar policy was adopted by Australia. A great part of the movement of emigration in earlier years was uncontrolled by governments, but economic and political stresses have increasingly led governments to regulate the settlement of aliens.

Most countries have adopted immigration quotas, limiting the inflow to settlers of certain types or occupations. To assist British subjects of suitable categories to emigrate to the dominions, an Overseas Settlement department was set up in 1922, and schemes of assisted emigration were drawn up by the dominions themselves.

The period, which included the preparations for the Second Great War, the war itself, and its aftermath, was marked in Central Europe by forced migrations on a large scale. A solution of acute minority problems (e.g. that of Sudeten Germans in Czecho-Slovakia) was sought by dispossessing those of the minority stock and transporting them to their countries of historical origin. See Alien; Coolie; Immigration; Population.

**Emigrés.** Term applied to Frenchmen who sought refuge in foreign countries during, and immediately after, the French Revolution. Most of these supporters of the old regime went to the Rhenish states of Germany, but everywhere actively advocated the restoration of the Bourbon dynasty. Their hopes of a speedy accomplishment of this object were shattered when the French Revolutionary armies defeated the Prussians and their allies at Valmy in 1792. After the final overthrow of Napoleon in 1815 the *émigrés* who were still alive or had not permanently settled abroad returned to France.

**Emilia.** Administrative division of N. Italy. It slopes from the Apennines to the river Po, and reaches the Adriatic. The name is derived from the Roman Via Aemilia, the great N. road which passed through the territory. The compartimento includes the provs. of Bologna, Ferrara, Forlì, Modena, Parma, Piacenza, Ravenna, and Reggio Emilia. Low-lying along the coast, it is elsewhere hilly, and is drained by tributaries of the Po. Area, 8,547 sq. m. Pop. 3,472,017.

**Eminescu, MIHAIL** (1849-89). Rumanian poet and editor. Born at Ipateshti in Moldavia, Dec. 26, 1849, he was educated at the universities of Vienna, Jena, and Berlin. In 1870 he contributed two memorable poems, *Venere si Madona*, and *Epigoni*, to the *Convorbiri Literare*, and in 1874 he was appointed school inspector and librarian in the university of Jassy. He died at Bukarest, June 15, 1889. He is regarded as a great lyric and satiric poet.

**Emin Pasha** (1840-92). German administrator. Born at Oppeln, Silesia, March 28, 1840, of

Jewish parents, his real name was Eduard Schnitzer. After studying medicine at Breslau and Berlin, he took up an appointment on the staff of Hakki Pasha, in Turkey. In Egypt, in 1878 he was appointed by Gordon governor-general of the equatorial province. When the Sudan was abandoned Emin was left in the heart of the country, whence he was rescued by Stanley in 1888. Returning, in the German service, he met his death at the hands of Manyama Arabs, Oct. 23, 1892. His success in abolishing the slave trade in the district under his control, his careful survey of over 4,000 miles of road, and his observations of the flora, fauna, and meteorology of the country gained him an enduring reputation.

**Emir.** Arabic word meaning commander, also spelt *ameer* (*q.v.*) or *amir*. It is used for chiefs and other rulers of certain Mahomedan peoples, the form *emir* being mainly confined to those in Africa.

**Emissivity.** The ratio of the heat energy emitted by a unit area of the surface of a body under given conditions to that emitted by the same area of a perfect black body under the same conditions. This is always exactly equal to the absorptive power. A surface coated with lamp-black will absorb practically all the heat energy falling upon it without reflection; its absorptive power is taken as unity. A surface heated uniformly and viewed through a small hole approximates to black body conditions, but if an article be taken out from the furnace into the open its surface will reflect and so it will radiate less energy than a black body at the same temperature. Emissivity thus depends on the kind of surface, the temperature, and the wave-length radiated. Optical and radiation pyrometers, used for measuring liquid steel and metal temperatures, are often calibrated for ideal black body conditions, so it is useful to know the emissivity of metals under various conditions.

**Emma** (1858-1934). Queen of the Netherlands. Daughter of the prince of Waldeck-Pyrmont, she was born Aug. 2, 1858, and in 1879 married William III, king of the Netherlands. Her daughter Wilhelmina (*q.v.*) became heiress to the throne on the death of William's sons by his first consort, and when William died in 1890, Emma was regent for eight years. Her many charitable acts endeared her to the poorer classes. She died March 20, 1934.

**Emma.** Novel by Jane Austen, written in 1815 and published the following year. It is one of the best of its author's works, full of character and humour in the presentation of the society of Highbury, a "large and populous village almost amounting to a town."

**Emmanuel College.** College in the university of Cambridge. It was founded in 1584 by Sir Walter Mildmay, chancellor of the exchequer, and is now governed under statutes dated 1925 by the master and fellows, 24 in number. Of the original buildings of the Dominican

Emmanuel College arms

house adapted to the use of the college at its foundation, the dining hall, fellows' combination room, old library, and parts of the master's lodge and the kitchen survive. Old Court dates from 1633; the chapel (bearing the date 1677) and picture gallery are the work of Wren; the rest of the buildings of Front Court which front St. Andrew's Street date from the 18th century. New Court dates from the early 19th century and North Court from 1914. The college was long a stronghold of Puritanism; among its famous men were Archbishop Sancroft and John Harvard, founder of the American college named after him. See Architecture illus. p. 572.

**Emmaus.** Ancient town of Palestine. It is now represented by the village of Amwas, on the road between Jaffa and Jerusalem, noted for a medicinal spring. It is not to be confused with the Emmaus of the N.T., near which Christ appeared to His disciples after the Resurrection; the site of this is unknown.

**Emmen.** Town of Holland, the biggest place in Drenthe. It is 29 m. S.S.E. of Groningen, just N.W. of the Berger Meer, and on the road from Groningen to Koevorden. The inhabitants are principally engaged in agriculture and stock rearing. Pop. 48,127.

**Emmenthal Cheese.** Swiss cheese, similar in appearance to Gruyère (*q.v.*), but half as large again, and with higher milk content. Though Swiss by origin, it is also made in mountainous districts of S.E. France and elsewhere.

**Emmerich.** Town of Germany in North Rhine-Westphalia. It stands on the right bank of the Rhine, 5 m. N.E. of Cleves, and not far from the frontiers of the Netherlands. The minster church was built in the 11th and 12th

centuries. Emmerich is an old place, having been a Roman settlement. In 1217 it was made a town; in 1407 it joined the Hanseatic League, and as part of the duchy of Cleves it passed into the possession of Brandenburg in 1609. Having been for a few years part of Berg, it was returned to Prussia in 1815. Heavily bombed and shelled by the Allies during the Second Great War, Emmerich was captured by the 1st Canadian army on March 29, 1945. It had been stubbornly defended by German parachute divisions and was completely destroyed.

**Emmet, ROBERT** (1778-1803). Irish nationalist. Youngest son of the physician to the viceroy, and

Robert Emmet, Irish nationalist After Petrie

brother of the United Irishman, Thomas Addis Emmet (1764-1827), he was born in Dublin and educated at Trinity College there. During 1800-02 he travelled on the

Continent, and was fired with the idea of securing French aid from Bonaparte in a rising against England. He collected arms at depots in Dublin and drew up a full plan of campaign for a rising on July 23, 1803. But treachery and faulty organization frustrated his plans, and Emmet fled into the Wicklow Mts. On Aug. 25 he was arrested near Harold's Cross, was found guilty of treason, and hanged, Sept. 20. The hold of Emmet's memory on popular imagination in Ireland was increased by the story of his love affair with the daughter of John Philpot Curran (*q.v.*), which inspired Moore's lyric, *She is far from the land where her young hero sleeps*. A study by R. Postgate appeared in 1932.

**Emney, FRED** (1865-1917). A British comedian. Born in London, March 5, 1865, he appeared at Sadler's Wells in *The Ticket of Leave Man* in 1885. One of the most popular comedians of pantomime, he produced in 1912 the sketch by which he is best remembered, *A Sister to Assist 'Er—opening with the often-quoted line, "Is Mrs. May hin?"*—and, with Sydney Fairbrother, acted in it for three years. While rehearsing for a pantomime he slipped and received a fatal injury, from which he died, Jan. 7, 1917. His son Fred (b. 1900) also became a well-known comedian, distinguished for his great girth.

**Emotion** (Lat. *emovere*, to agitate). State of mind of an affective type. Emotions are chiefly composed of specific feeling-tones which differ greatly, e.g. triumph, rage, despair. They are pleasant or unpleasant, sometimes to a high degree. The strength, duration, and pleasantness or painfulness of emotions vary greatly from man to man; some enjoy violent anger, while others are exhausted by it or experience anxiety.

The original sources of emotions are situations which evoke instinctive action. Fear is caused by danger; sympathy by the sight of pain or grief. Emotions may subsequently be reawakened at a time when they bear little relation to the real needs of the individual; e.g., some feel "fighting-mad" when questioned by a policeman. Once roused, emotion is not easily modified by either reason or conscience, and when violent tends to control behaviour and affect beliefs. In many people emotion is easily switched from one object to another; thus arises the state known as "spoiling for a fight." For all these reasons emotion has been generally reviled by moralists. Emotions are unreliable guides to conduct and opinion, and one of the chief objects of moral education is to bring them under control. Yet they add colour to life; and the group known as "disinterested," including pity, and love of offspring, is indispensable to society.

Emotions have a marked effect upon many bodily functions. They cause the muscles of the face to assume expressions, through which we recognize the feelings of others. Attitudes, breathing, the action of the heart, the autonomous nervous system, and the ductless glands may all be changed. Consult *Expression of the Emotions in Men and Animals*, C. Darwin, 1872; *Psychology of the Emotions*, T. A. Ribot, 1897.

**Empedocles** (c. 495-435 B.C.). Greek philosopher of Agrigento in Sicily. He was the first to teach that all material substances are compounded from the four so-called elements, fire, air, earth, and water. These four elements are continually being separated and mingled by two moving forces, one Love or Friendship, the other Strife. He thus combined the Being of the Eleatics (q.v.) with the Becoming of Heraclitus (q.v.). According to legend, Empedocles threw himself into the burning crater of Etna in order that the completeness of his disappearance

might engender the belief that he had been translated alive to heaven. This is the subject of Matthew Arnold's *Empedocles on Etna* (1852). *Pron.* Em-ped'-o-kleez.

**Empedrado**. Town of Argentina, in Corrientes prov. It is on the Paraná, some 650 m. by rly. N. of Buenos Aires, also reached by steamer via Corrientes. It is the centre of a fruit-growing region. Pop. 24,300.

**Emperor** (Lat. *imperare*, to command). Title applied to sovereigns of the highest class. It was first used in this sense by Julius Caesar, who, among other titles, called himself *imperator*, a title hitherto borne by certain officials while in command of troops abroad. His nephew Augustus established the empire, and the title was borne by his successors both in Rome and in Constantinople; it was taken by Charlemagne when in 800 he founded the medieval empire. The rulers of the Holy Roman Empire bore it until the dissolution of that body in 1806, and in the 19th century it was assumed by several rulers who regarded themselves as more powerful than ordinary kings. Chief among these was Napoleon, who in 1804 assumed the title of emperor of the French, an example followed in 1852 by Napoleon III.

While the English translated the word *imperator* as emperor and the French as *empereur*, the Germans had rendered it as *Kaiser*, a tribute to Caesar, and this was the title taken by Francis II when he became emperor of Austria in 1804. In 1871 William I took the title of *Deutscher Kaiser*, but in both these cases the idea was well represented by the English word emperor. Less correctly, perhaps, the Russian *tsar* was freely translated emperor.

In the New World there were emperors of Brazil from 1821 to 1889, and in 1864 Maximilian of Austria took the title when he set up his empire in Mexico. The word is also used to translate the titles of rulers of Eastern countries: for instance, we speak sometimes of the emperor of Japan. In 1876, Queen Victoria became empress of India—the first British sovereign to bear the title *Kaiser-i-Hind*. The Greek word *basileus* is usually translated emperor. This was applied to certain rulers before the Christian era, and was taken by the emperors at Constantinople.

The original idea was that there could be only one emperor, whose authority extended throughout Christendom, and who was the overlord of kings. The modern

tendency is to use it for the ruler of a collection of countries, but, although we speak of the British empire, it has, strictly speaking, no emperor. See *Sovereignty*.

**Emperor Butterfly** OR PURPLE EMPEROR (*Apatura iris*). Large British butterfly, localised in oak-woods of S. and S.E. England. Usually it frequents the tops of trees, but descends to feed on carrion. The male is dark brown with a rich purple sheen; a white band and spots occur on the wings. The female is without the purple reflection. The caterpillar feeds on the sawfly. See *Butterfly*; also colour plate facing p. 1598.

**Emperor Concerto**. Title bestowed upon Beethoven's concerto in E flat for pianoforte and orchestra (op. 73). Composed in 1809, and dedicated to the archduke Rudolph, this was the fifth of Beethoven's piano concertos, and is remarkable for spaciousness and several innovations, e.g. the linking of the second and third movements; instead of the traditional tutti for orchestra at the beginning of the work, the piano-entry at the second bar; and dispensing with the customary cadenza (hitherto improvised by the performer), Beethoven writing his own. The concerto may be considered one of his most popular compositions.

**Emperor Moth** (*Saturnia pavonia*). Large, fairly common British moth; the male flies in

Emperor Moth,  
*Saturnia pavonia*

sunshine and the female is mostly a night-flier. The wings are mottled brown and tawny, with a conspicuous eye in the middle of each. The

caterpillar feeds on the sawfly, bramble, heather, and other plants.

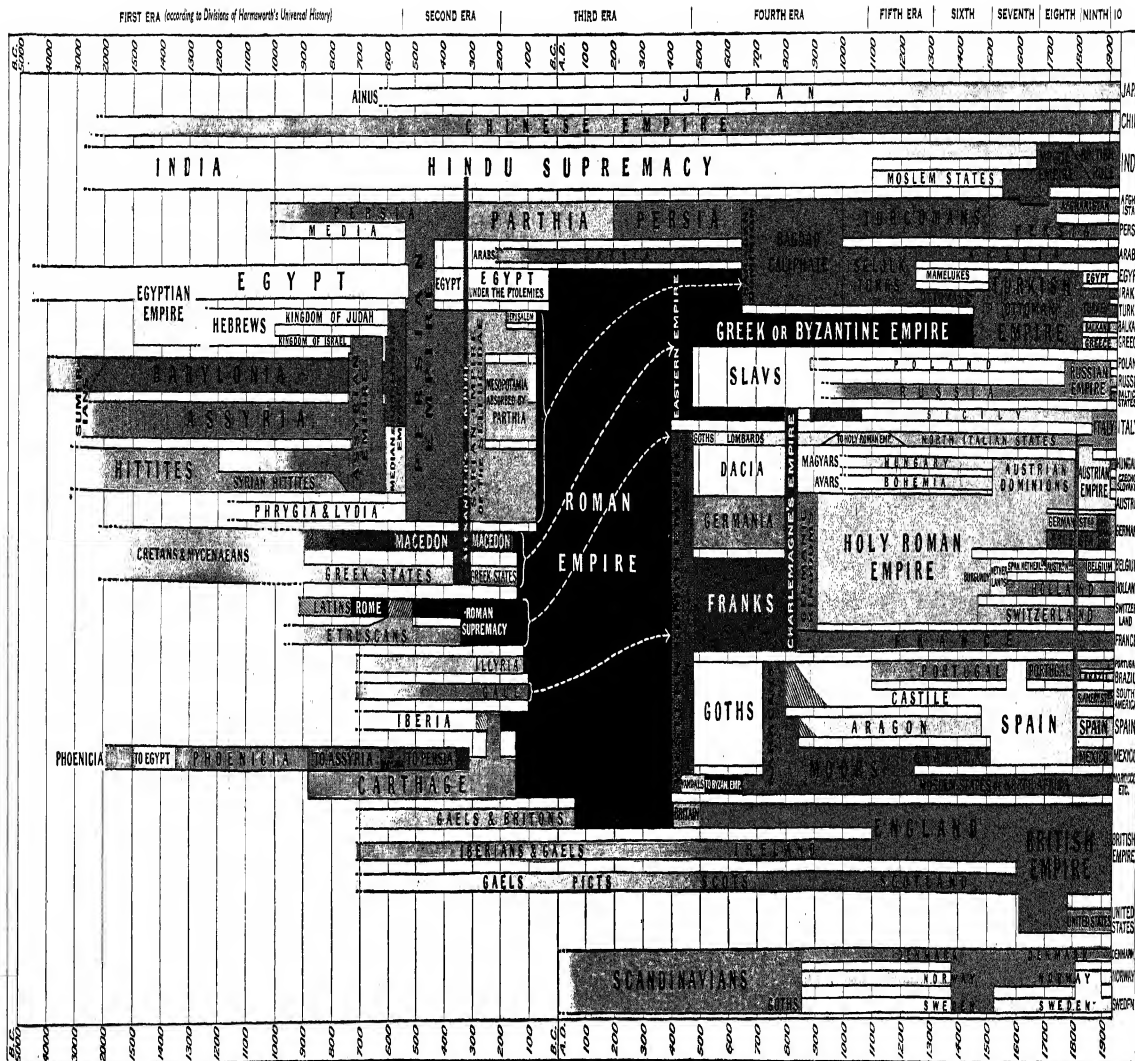

**Empetraceae** (Gr. *empetros*, growing on rocks). Family of evergreen heath-like shrubs. They are natives of the N. temperate and arctic zones, also of Chile and Tierra del Fuego. They have small,

Empetraceae. Leaves and fruit, also shown in section, of red crowberry

At some undefinable date in the neighborhood of 4000 a.m. there are indications that social life in Egypt and Mesopotamia was progressing towards the formation of organized states. History in both these regions opens shortly before 3000 a.m.; and it should here be noted that whereas this chart is divided into 100-year intervals back to 1500 a.m. roughly the date of the first empire in a modern sense, the preceding intervals are compressed. Actually the period between 3000 and 1500 a.m. should occupy as much space as the subsequent period to the beginning of the Christian era.

During all these centuries there were representative to imperial expansion. Thus in Mesopotamia Lagash-Enlil, about 2700 a.m. established a hegemony, later over and maintained for little more than a century by the kings of Akkad; the "empires" of the Kings of Akkad (c. 2300) were equally transient. Sumer and Akkad were early brought under Egyptian rule.

In 1500 a.m. a ruling class of foreign invaders was expelled from Egypt, and the reborn Egyptian state was as far as the Egyptians; but it was only from 1400 onwards that the potential empire thus created was methodically conquered and organized by the genius of Thutmose III. From the considerable details of its administration that have come down to us we are justified in calling this the world's first genuine empire. In the meantime an experiment in federation under the leadership of the dominant tribe of Hatti was being conducted in Asia Minor, and when after about a hundred years, the empire of Thutmose crumbled away, Mesopotamian-Elamite took the opportunity of establishing a Hittite empire over Syria. Egypt revived and recovered some lost territory, but the position was one of stalemate.

World-movements of peoples swept away the Hittite Empire and inaugurated a degenerating Egypt in about 1200 a.m., and in the resulting vacuum Phoenicia and the kingdom of Israel and Sidon could prosper. Of the "Minoan" sea-power of Crete, later taken over by Mycenae, no historical details have been recovered.

The Hebrew kingdom split into tribal forms (c. 1200 a.m.). Like Babylon, the Phoenician cities were intent on trade alone, movements of God-appealing peoples into the Levant were blunted the Mesopotamian power from memory, Egypt was priest-ridden and impotent. A Phrygian kingdom was consolidating in Asia Minor, but apart from this the only viable power on the stage was Assyria. By methods too ruthless to be called imperial Syria and Palestine were absorbed, Babylon reduced to a vassal state, and finally Egypt conquered (600 a.m.), only towards the end was a system of Assyrian provinces instituted. But new peoples were appearing: the Aryans invaded mixed with Babylon and had wiped out the Assyrian name, then after dividing the empire with the Babylonians, with Egypt recovered independence.

In the West the Greeks were creeping round the Mediterranean. The Britons had appeared in northern Italy, Rome by tradition was founded in 753 a.m., Carthage in 800.

The Median kingdom had passed to the mythic house of a cognate tribe, the Persians, and in 559 a.m. Cyrus the Great took over the Babylonian domains. Lydia, the successor of Phrygia in Asia Minor, fell to him, Egypt to his son Cambyses; Darius, son of an allied house, organized these vast territories into what again we are entitled to call an empire in the full sense. But attempts to extend it to Europe were defeated by the Greeks.

Walled by the sea, the last political union of Greek city states emerged as the Athenian Empire. But intestine rivalries wrecked it, and only was finally imposed from without by the half-Greek Philip of Macedon, whose son Alexander won himself at the heart of Persia and won the greatest empire yet known; his death, however, was the signal for disunion. Seleucos obtained the greatest portion, the East, later controlled by the Ptolemies.

Rome was winning ascendancy in Italy, and by 200 a.m. had fought out her struggle with Hannibal (Carthage).

Rome's first task had been to make herself mistress of Italy; the three problems being her Latin kinsmen, the Etruscans north, and the Greek south. Next, her defeat of Carthage gave her Sicily and Spain, and in the meantime Lydia was poised, the latter, together with Macedonia backing her Hannibal, led to interference in the East. Macedonia was quenched in 168 a.m., "Asia" in 193.

After 100 a.m. Rome definitely stands forth as an imperial state; but in spite of the addition to her territories of the Seleucid dominions (160), Gaul (50-50) and Egypt (30), the Republic was incapable of ruling the Empire. Augustus became Emperor in 31 a.m., and thereafter for 400 years almost all the known world was theoretically a single state from Atlantic to Empires.

Yet before the end of this period decay had set in. The Goths invaded Italy in A.D. 569; the Persian dynasty that succeeded the Parthians reconquered much of Mesopotamia; Dacia had fallen away in the last of the century; and between 384 and 395 the Christianized empire definitely split into Western and Eastern halves.

The Byzantine Empire was destined to survive until the capture of Constantinople by the Turks in 1453, sometimes with wide-flung dominions, sometimes with a meagre strip of territory, but always, hitherto the rule of Europe's bulwark against the East. In the West everything went to pieces under the shock of barbarian invasions. Alaric captured Rome in 410; Vandals and Visigoths flooded into Spain. Vanished into Africa, Franks and Alamanni into Gaul, Ostrogoths and Lombards into Italy, Saxons into Britain. Finally, the last hope of Europe was pushed off in 476, only the Papacy carrying on the tradition of a world state. Carthage, the capital of the Franks, now pre-eminence, and as too was crowned Emperor by the Pope, thus originating the idea of the Holy Roman Empire.

In the East, Islam started its career with Mahomet (570-632) and swept like a tide over Arabia, Syria, Persia, North Africa, and Spain. The Caliphs first ruled from Damascus, then (750) from Baghdad, with a final caliphate (900) in Spain; where Aragon and Castile maintained Christian independence in the north.

Imperialism during this period occurred to the East. Afghan rulers established a Mahomedan dynasty at Delhi in India (1192); the Bagdad Caliphate disintegrated before Turkish invasions which consolidated into the Seljuk Empire; the Seljuks gave way to the Ottomans, who advanced their arms steadily into Europe.

In Europe the outstanding tendency was the growth of nationalism. England and France achieved nationhood previously, the first because of its isolation, the second because of the battle of Hastings. National spirit, in spite of political disunion, was fostered in Spain by the continual struggles against the Moors; Switzerland was independence from the Holy Roman Empire (1308); later, the Swiss confederacy called Russia round the prince of Moscow. Bohemia, Hungary, and Poland were consolidating since their adoption of Christianity in the tenth century. In Italy and Germany state was disunion perpetuated by the Holy Roman Empire; actually a patchwork of semi-independent cities and kingdoms, torn by the struggle between Pope and Emperor.

At this point history entered on a fresh phase with the discovery of the Cape Route by the Portuguese and the New World by the Spaniards. A Papal Bull granting dominion over the world outside Europe to these two powers—the West to Spain and the East to Portugal.

Spain made good much of her claim to the West, in spite of English and French colonisation; whereas the Portuguese state was modelled, not only by English and Dutch, but by the existence of Turkish, Mogul, Japanese, and Chinese Empires. Meanwhile the Holy Roman Empire became centred on Austria, while Prussia achieved independence. France and England took rank beside Spain as colonising powers. During the conflict between them the loss of the British States seemed to put an end to the British Colonial Empire, but with Canada, Australia, and the Cape it was about, while the acquisition of India resulted in an Empire of a different sort. Russia had become an empire in the full sense. Napoleon seemed to make a French Empire of Europe, his failure left the Spanish Empire in ruins (S. American States), but the unification of Germany a potentiality, realised by the Franco-Prussian War. Italy was united in 1870-71.

The Turkish Empire in Europe was disintegrating; and the First Great War broke it up, together with those of Germany, Russia, and Austria. The Second Great War destroyed the empires of Italy and Japan and brought new independence to some of the Eastern possessions of Britain, France, and the Netherlands.

EMPIRE: CHART SHOWING THE RISE AND FALL OF EMPIRES AND NATION STATES FROM THE DAWN OF HISTORY TO A.D. 1938

narrow, alternate leaves, and small, regular flowers, succeeded by fleshy berries. See *Crowberry*.

**Emphysema** (Gr., inflation). Condition in which the alveoli or air-cells of the lungs are over-distended with air and their walls atrophied. It is due mainly to long-continued increase of pressure of the air within the lungs and is most often seen in players on wind-instruments, glass-blowers, and sufferers from chronic bronchitis. Heredity plays some part.

Emphysema produces enlargement of the chest, which becomes barrel-shaped owing to arching of the ribs and sternum; the costal cartilages frequently become calcified, and movement of the ribs during respiration is much diminished, breathing being effected chiefly by means of the diaphragm muscle. The symptoms come on gradually, the earliest being some difficulty in breathing and feeling of "tightness" in the chest. The incomplete oxygenation of the blood may lead to cyanosis or blueness of the face. The disease may persist for many years, but gradually becomes worse. Death may occur from pneumonia, or the long-continued pressure in the lungs may lead to dilatation of the heart and dropsy. Medical treatment is not of much avail. Attempts have been made to increase the respiratory ventilation of the lungs by compressed air baths, etc.

Subcutaneous or surgical emphysema is a condition in which air finds its way into the tissues of the body, most often because of an injury which has resulted in an abnormal communication between an air-containing cavity and the subcutaneous tissue. In rupture of a lung, for instance, air may pass under the pleura or lining membrane, and spread up into the root of the neck and over the chest, producing swelling and a characteristic crepitation on pressure. Fracture of the frontal sinuses or air-cells may lead to subcutaneous emphysema in the forehead.

**Emphyteusis** (Gr.-Lat., im-planting). Term of Roman law. It meant the right to enjoy the fruits of property belonging to another, on payment of a *pensio* or rent to the owner. It applied not only to land and houses, but to other property, e.g. slaves. The lessee might not allow the thing to deteriorate in value; and was bound to pay the rent whether the thing was beneficial to him or not.

**Empire.** Word derived from the Roman word *imperium* and meaning rule. It was used to describe the lands ruled by an emperor, the

most powerful of temporal rulers, who claimed to be superior to kings. The Roman empire founded by Augustus was succeeded by the medieval empire, known as the Holy Roman Empire, and by the Byzantium empire at Constantinople. In the 19th century there arose the Austrian, French, and German empires, and in the New World those of Brazil and Mexico.

The word is used also for large states of the E., and we speak of the Indian and Japanese empires. Moreover, the great states that existed before the Christian era are, for convenience, called empires, and we are familiar with a cycle of empires—those of Assyria, Persia, Macedonia preceding that of Rome. At present the tendency is to describe a federation of states as an empire. The succession of the world's great empires is graphically depicted in the colour plate.

**Empire, HOLY ROMAN.** Medieval institution that lasted from 800 to 1806. The Holy Roman Empire was born on Christmas Day A.D. 800, when Charlemagne was crowned emperor by the pope. It expired in 1806, when Francis II dropped the ancient title and called himself emperor of Austria.

From A.D. 475 to A.D. 800 Constantinople had been the seat of the lineal successor of the Roman emperors, whose supremacy in the W. had been a mere figment, while the bishops of Rome had asserted a claim to be the spiritual head of Christendom in defiance of the E. authority whether temporal or ecclesiastical. Charlemagne made himself effective master of W. Europe, and the defender of the papacy against its enemies; and, as at Constantinople the empress Irene usurped the imperial throne, the pope crowned the Frankish king as the heir of the Caesars and Roman emperor. The actual title, the Holy Roman Empire, was adopted by Otto I in 962.

#### The Dominions of Charlemagne

The new Roman Empire, then, was at first co-extensive with the dominions of Charlemagne. The British Isles were outside it; so was Scandinavia; and so was the greater part of Spain. Roughly speaking, the line of the Elbe and the Adriatic Sea marked its E. boundary. Under Charlemagne's successors it was parted into three portions: the Latinised West, which retained the Frankish name, and was ultimately shaped into the kingdom of France; the eastern or definitely German section, which was gradually extended till it em-

braced all the German and some of the Slavonic peoples; and the central portion, lying about the rivers Rhine and Rhône, and including the greater part of Italy, of which, however, a S. remnant continued to be attached to the E. empire.

In spite of the division between the princes of the Carolingian house, one was recognized as enjoying a sort of primacy, and he bore the imperial title. But the Carolingian dynasty wore itself out by the beginning of the 10th century in the eastern and middle kingdoms; with the result that France became independent, while the supremacy in the empire passed to an elected German king, who himself only bore the imperial title when he had been crowned in Rome. Fragments of the middle kingdom were attached to France, but the greater part of it was included in the empire.

The first German king was Henry the Fowler; under his son Otto the Great, the Holy Roman Empire was reconstituted. There was no hereditary right of succession to the German kingdom; but the descendants of a powerful emperor usually retained the succession for generations. The ruler was therefore German king by a mixture of election and descent, for the elected king was more frequently than not a son or near relative of the late ruler.

#### Great Congeries of Principalities

A custom grew up by which, in order to avoid an electoral struggle on the death of an emperor, the future emperor was designated during the lifetime of the reigning one, and he bore the title of king of the Romans. The Empire in fact was a great *congeries* of principalities large and small, lay and ecclesiastical, of which one of the princes was the official head, by right of election and by sanction of the exercise of physical force superior to that of rivals or recalcitrants. From the middle of the 10th century to the middle of the 13th the emperor is in the first place a German prince having a limited authority over the rest of the German princes. In the second place he is the legal overlord also of Italy; the tradition and title of the Empire fosters in the emperors a desire to be Roman Caesars rather than German Kaisers. Thirdly, the emperors incarnate the idea, but not the fact, of Christendom as a unity.

But beside the Empire as unifying Christendom stood the papacy, actually dominating the entire ecclesiastical organization of Western Christendom, claiming for the

pope a spiritual supremacy overriding that of the emperor as the temporal head of Christendom; and overriding that of all temporal authorities whatever within their own dominions. Theoretically, the papacy did not claim to exercise control over things temporal. But practically the lay and ecclesiastical interpretations of the spiritual and temporal spheres of control differed and overlapped, so that there was an endless contest of authority. Thus we have the emperors in their fourth aspect, as the supreme representatives of secular authority in antagonism to ecclesiastical authority, in the contest between Church and State.

#### Guelfs and Ghibellines

The Saxon emperors, Henry and the three Ottos, finally rolled back or stemmed the advance of more barbarian races on the E., and penned the Magyars into Hungary. They dominated the papacy, nominating several of the popes. They were followed in the 11th century by the Franconian or Salian series, Conrad II and Henry III, IV, and V. The reign of Henry IV was marked by the struggle between the emperor and Pope Gregory VII, with whom begins the great period of papal domination. With Henry's death the rivalry opened in Germany between the Saxon house of the Welfs, or Guelfs, and the Swabian house of the Hohenstaufen.

The Swabians secured the imperial crown for some generations; hence the anti-imperialists in Italy adopted the name of Gueff as a party title, while the imperialists were called Ghibellines. The emperor Frederick Barbarossa (1152-90) was worsted in his struggle with the popes, while the cities of Lombardy succeeded, after a hard struggle, in securing their liberties; but in Germany he broke the power of the Guelfs and established his own supremacy, which was maintained by his successor, Henry VI. Henry, by his marriage, acquired the kingdom of Sicily; his son, Frederick II, the last Hohenstaufen emperor, succeeded to the empire after an interval of contest between other rivals. But he was in effect a Sicilian, not a German. His reign and the strife which preceded it destroyed what Frederick I had done towards the unification of Germany itself. Frederick II's death in 1250 was followed by the great interregnum during which no imperial authority was recognized. It was brought to an end by the election of a minor prince, Rudolph of Hapsburg, 1273, who laid the foundations of the greatness of that famous house.

The medieval European system was now breaking up. The papacy lost prestige by its transference from Rome to Avignon. The imperial crown passed from one house to another; from Hapsburg to Luxemburg, from Luxemburg to Bavaria, from Bavaria back to Luxemburg. It was at this time that a group of German princes were definitely established as the electors with whom alone lay the right of fixing the imperial succession. Sigismund, son of the emperor Charles IV, acquired the kingdom of Hungary by marriage, though it was not brought within the imperial bounds as was Bohemia. With Charles IV the efforts of German rulers to maintain their position in Italy came to an end.

The reign of Sigismund, during the early part of the 15th century, is chiefly notable for the reinstatement of the papacy after the great schism at the council of Constance (1414-18), and also for the establishment of the first Hohenzollern margrave of Brandenburg, the progenitor of the kings of Prussia.

On Sigismund's death, in 1437, Albert of Hapsburg became king and emperor; and from his day until 1806 a Hapsburg was, with one exception, at the head of the Holy Roman Empire.

#### Effect of the Thirty Years' War

In 1519 Charles V succeeded his grandfather, Maximilian I, as emperor. His reign is contemporaneous with the development of the Reformation. The hereditary Austrian and other German estates of the house of Hapsburg were transferred to Ferdinand, the brother of Charles, and he succeeded his brother as emperor in 1556. The pacification of Passau, procured mainly by his agency just before his accession, gave Germany peace for some 60 years by establishing a compromise between the Roman Catholic and Protestant princes. The attempt of Charles V to establish the personal supremacy of the emperor throughout Germany, failed; German princes, big and little, were nearly independent sovereigns.

In the 17th century Ferdinand II, in the Thirty Years' War, sought to bring the Protestant princes into subjection, while Wallenstein, careless of the religious question, sought by means of the war to make the emperor absolute monarch of Germany. Both attempts failed. After the Thirty Years' War (1618-48), the independence of the greater German princes was an established fact, while the still nominal imperial authority was little more than a

fiction. The struggle of the next 100 years between Bourbon and Hapsburg was not a struggle between the Empire and France, but between the Hapsburgs and France. Although the war of the Austrian succession included a contest for the succession to the imperial crown between the Bavarian claimant, Charles Albert, and Maria Theresa, the representative of the Hapsburgs, that was altogether a minor aspect of the struggle.

#### End of the Holy Roman Empire

Charles Albert was made emperor, but on his death the crown reverted to the Hapsburgs in the person of Francis of Lorraine, whose son Joseph II again aimed at establishing an imperial ascendancy by the consolidation of Hapsburg dominions within Germany. The attempt, however, collapsed when Frederick II of Prussia formed the *Furstenbund* (League of Princes) to maintain the constitutional rights of the German princes—which meant in effect their freedom from any recognizable imperial control.

In 1792 the French Republic went to war, not with the Empire, but with Austria. It was Austria, not the Empire, which was brought to submission by Bonaparte in 1797, again by Moreau at the battle of Hohenlinden in 1800, and by Napoleon at Austerlitz in 1805, when Napoleon had already proclaimed himself emperor. There was no longer any plausibility in maintaining the pretence that there was one imperial head of Christendom, so in 1806 the emperor Francis dropped the title and the Holy Roman Empire ended.

The history of the Holy Roman Empire down to the 16th century is, in respect of one part of it, identical with the history of Germany, and, in respect of another part, is intimately bound up with the histories of Italy and of the papacy. In the 16th century it is practically the history of Germany; the emperor is the German emperor with no pretensions to being the Roman emperor or the head of Christendom. From the middle of the 17th century the emperor is the Austrian emperor; the German or Holy Roman Empire exists only in name, with the survival of constitutional forms, until even the name disappears in 1806. See *Charlemagne*; *Electors*; *Golden Bull*; *Papacy*; consult also *The Holy Roman Empire*, J. Bryce, 1864 and later; *The Empire and the Papacy*, T. F. Tout, 1898; *The Medieval Empire*, H. A. L. Fisher, 1898; *The Close of the Middle Ages*, R. Lodge, 1901. A. D. James

**Empire Air Training Scheme.** Wartime scheme for training British and Empire airmen in the Dominions. Set up by an agreement signed at Ottawa, Dec. 17, 1939, between Great Britain, Canada, Australia, and New Zealand, this scheme provided for the training of airmen from these dominions and from Great Britain at schools established in New Zealand, Australia, and Canada, but principally in the last, because of its size and comparative proximity to Great Britain. It was devised to avoid the difficulties of air training in Great Britain, due in particular to that country's vulnerability to air attack. Most of the initial cost was borne by the dominions concerned, but the agreement provided for the reimbursement of their governments on the basis of the number of airmen trained. New Zealand gave elementary training to her own nationals, and Australia provided both elementary and advanced training; airmen from both received final flying training in Canada.

The four commands in Canada were centred at Montreal, Toronto, Winnipeg, and Regina. Each was sub-divided into elementary and service flying schools, observer, navigation, bombing, and gunnery schools, and engineering and technical training schools. Originally most of the instructors came from the U.K., but soon a central training school for instructors was opened at Trenton, Ont. By the end of 1940, 48 training schools in Canada were capable of producing 20,000 pilots and 30,000 other members of air crews per annum. Training absorbed 4,100 aircraft. These figures were later considerably exceeded. The first pilots to complete their training in Canada arrived in England in Dec., 1940.

Australia provided training for 10,000 pilots and 15,000 gunners, observers, and wireless operators over a period of three years, building 35 training schools for the purpose. The scheme was closed down in March, 1945.

**Empire Day.** British imperial celebration held annually on May 24, anniversary of Queen Victoria's birthday. The first celebration was in Canada in 1897, being organized at Hamilton, Ont., as a means of popularising Empire study among school children. The Dominion Teachers Association adopted the celebration, and thereafter Empire Day was held throughout Canada on May 23, May 24 being already a

school holiday. In 1902 the earl of Meath suggested an Empire Day celebration throughout the Empire and wrote to all prime ministers and governors within it outlining his plans. The first Empire-wide celebration was in 1904. The aim was to introduce a training that would produce patriotic citizens of the Empire, special prominence being given to saluting the flag. In 1921, at Lord Meath's request, the Royal Colonial Institute, now the Royal Empire Society (*q.v.*), undertook responsibility for the movement.

**Empire Free Trade.** Campaign for the adoption of free trade within the British Empire initiated by Lord Beaverbrook (*q.v.*) in 1929. Its object was the imposition by Great Britain of duties on meat, wheat, and other commodities from foreign countries, but not from the dominions, and the reciprocal admission by the dominions of British manufactured goods free of duty. Although the campaign earned some support from farming communities in the dominions, it was generally rejected by the dominion governments, whose policy was to encourage the development of local manufacturing industries.

**Empire Gallantry Medal.** British decoration, replaced by the George Cross in Sept., 1940. The E.G.M. was awarded to 61 military personnel and 68 civilians between 1923 and 1940, those holders living when the change was made receiving the George Cross in its place. Posthumous awards of the E.G.M.

Empire Gallantry Medal

made during the Second Great War were similarly replaced. The ribbon of the civil division was plain purple, that of the military division having a yellow vertical stripe down the centre. The medal was of silver, with "gallantry medal" inscribed on the reverse and "For God and the Empire" round the circumference.

**Empire Powder.** Smokeless sporting propellant manufactured by Nobel's Explosives Company. It is of the type designated 33-grain powder, the nomenclature signifying that this weight of propellant is the normal charge for a 12-bore gun, and comparable to the standard charge of 82 grains of black gunpowder. It

consists essentially of nitro-cellulose, containing about 12.5 p.c. of nitrogen, with small quantities of barium and potassium nitrate. Powders of this type are greatly valued for the low rate of recoil imparted to the gun. See Explosives; Smokeless Powder.

**Empire State Building.** Sky-scraper in New York City. Pending the completion of the Palace of the Soviets, Moscow, it was the tallest building in the world. Completed in 1931, the building,

Empire State Building, New York. It is 1,248 ft. high

named after the "Empire State" (New York), rises from the junction of Fifth Avenue and W. 34th Street, is 1,248 ft. high, and is surmounted by a television transmission mast. There are 102 storeys above street level and two below. On the top floor there are an air-conditioned restaurant and an observation gallery. On July 28, 1945, a U.S. army bomber crashed in mist into the 79th storey of the building. In the crash and the fire that followed 13 people were killed and 26 injured.

**Empire Style.** In decoration and furniture, a development of the Directoire style, an outcome of the admiration felt by the leaders of the French Revolution for Greek and Roman culture. The Directoire style was severely classical in outline and decoration. A rectilinear outline was adopted, legs of tables and chairs were straight or tapered, round and fluted or reeded. Classic mouldings, capitals, and pediments, with a few republican symbols and animal masks, were the principal decorative commonplace.

With the Empire some of the solidity and simplicity of the Directoire disappeared. The furniture was rather light in

construction, and while the straight line was the rule in contour, curved lines were introduced in the decorative designs, such as wreaths of laurels, olive, and palm, dainty ribbon bows, and lyres. Imperial

Empire Style. Writing-desk showing decoration typical of this period

symbols, such as the eagle, bee, and crowned N, replaced the republican designs, while the sphinx was also used. Medallion portraits and figures (painted, enamelled, or porcelain plaques) were used, together with heavy gilded mountings of classic design. Much of the furniture was painted white, or gilded. White, gold, crimson, and dark blue were adopted for upholstery and hangings. The tripod and X legs are often seen. *See Furniture.*

**Empiricism** (Gr. *empeiria*, experience). In philosophy, the theory that regards experience as the only source of knowledge. It is closely akin to sensualism, the theory that all knowledge is only transformed sensation. The Stoics occupied a position midway between empiricism and idealism (*q.v.*), in that they considered the impressions made upon the soul through the sensations to be alone certain, but held that the truth or falsehood of these impressions depended upon their being characterised by an arresting power of conviction.

The founders of empiricism in modern philosophy are Hobbes, who maintained that all knowledge comes from the senses and that the activity of the mind merely consists in combinations of words, and Locke, according to whom the mind is a blank slate indebted for all its knowledge to the senses, which give it sensation and the perception of external objects, and to reflection which is exercised upon the operations of the mind. In more recent times its chief upholder is John Stuart Mill. *See Philosophy.*

**Employers' Liability.** Liability of an employer for injuries to his employees while acting in his employment. In the early

19th century, the increase in the number of factories, and the many accidents which took place then, would have imposed enormous liabilities on employers if they had been held responsible where the negligence of an employee caused injury to a fellow-employee. Accordingly the courts developed the doctrine of common employment under which an employer was not liable for the negligence of an employee when the person injured is a fellow-employee engaged in common employment with the employee who caused the injury. The Employers' Liability Act, 1880, provided that common employment should not be a defence to an employer where the employee injured was engaged in manual labour (other than domestic service) and the injury was due to (1) defects in machinery or plant; (2) negligence of superintendents (*e.g.* of a foreman); (3) improper bye-laws or instructions. On the railways, the doctrine was not a defence in the case of injuries caused by negligent management of signals, points, and trains.

The Workmen's Compensation Acts, the first of which was passed in 1897, provided that in the case of an employee engaged in manual labour or earning not more than a certain sum (£420 a year when the Acts were repealed in 1946) the employer should be liable to pay such employee compensation in the form of weekly payments for incapacity, and a lump sum, limited in amount, for death, for all injuries arising out of and in the course of his employment except injuries due to his own serious and wilful misconduct; and, if the injury caused death or permanent disablement, compensation was payable even if the injury was due to misconduct. Common employment was no defence to a claim under these Acts.

The employer might further be liable for injuries caused to an employee by some breach by the employer of some statutory duty—*e.g.* the duty to fence machinery under the Factory Acts, and to such a claim common employment was not a defence. Here again the claim was for a lump sum.

In 1946, the National Insurance (Industrial Injuries) Act, repealed the Workmen's Compensation Acts. For the resulting changes in the law relating to employers' liability, *see Insurance, National.*

**Employment Exchange.** Employment exchanges, totalling 540, with their subsidiaries, 483 em-

ployment offices, 181 branch employment offices, and 205 local agencies, form the local administrative units of the Ministry of Labour and National Service. Their work is co-ordinated by 11 regional controllers, and they deal directly with the public on matters not reserved for regional treatment. Of these employment exchanges, 113 are called allocation local offices, and to these are sent the registration forms of all men and women registering for military service. Action is taken, including medical examination, up to the point when the recruits are immediately available for posting for military duties. The actual call-up is done by the regional officer.

Within each employment exchange, and employment office, separate departments deal with men and women, and also with juveniles, where these are not dealt with by the local education authority.

The work of the employment exchanges consists chiefly of matters relating to the following: (a) Supply of labour and employment, including recruitment of trainees for government training centres; (b) The National Service Acts, including registration for national and military service; (c) Claims for unemployment benefit, applications for assistance, proof of unemployment, payments to refugees, issue of unemployment books and regulations; (d) Adjudication on claims to benefit; (e) Finance, including impressing for cash for benefit payments, issue of rly. warrants, payment of subsistence and lodging allowances, and compilation of man-power statistics.

Attached to most employment exchanges are local employment committees composed of representatives of employers and of workers. These act as advisory bodies to secure the benefits of local knowledge, and close co-operation between local exchanges, employers and applicants. At employment exchanges in large towns, juvenile advisory committees, composed of representatives of education authorities, employers, and youth organizations, advise on the first placings of children about to leave school. In many cases, special meetings of children are arranged, and advice and information are given by competent speakers. The secretary of the juvenile advisory committee arranges to be represented at the after care meetings held at each

school to advise scholars seeking employment.

Historically, employment exchanges are developments of the labour exchanges organized by local authorities under the Workmen's Unemployment Act, 1905, as a clearing house for vacancies and applicants. National labour exchanges were set up by the Labour Exchanges Act of 1909 and placed under the direction of the Board of Trade. These undertook the administration of the unemployment section of the National Insurance Act, 1911. During the First Great War the number of insured persons rapidly rose, and a large surplus accumulated in the unemployment fund. The growing importance of the work of the employment exchanges led to the establishment of a ministry of Labour in 1916. After the First Great War, the exchanges experienced their most difficult period. Administering in trying circumstances a succession of acts designed to alleviate increasing unemployment, they did much constructive work in promoting transfers, and organizing and conducting training schemes to enable workers to fit in with the new conditions. Just before the Second Great War they became the national service offices, issued the service handbook to all citizens, and the schedule of reserved occupations. The employment exchanges became the integral machinery for the mobilization of the nation's man and woman power. In normal times, employment exchanges play an increasing part in local life. Their activities touch the lives of almost everybody above school-leaving age. They help to divert labour towards industries where it is needed, and on their returns is based that necessary adjunct to the financial budget, a manpower budget.

**Empoli.** Old town of Italy in the prov. of Florence. It stands on the Arno, 20 m. by rly. W.S.W. of Florence, in a fertile district. The collegiate church, founded 1093, was destroyed in the Second Great War; its pictures are mostly housed in a neighbouring gallery. The church of S. Agostino was seriously damaged. Jacopo Chimenti, the painter, was a native. Empoli has manufactures of cotton, leather, glass, and art pottery. Indian troops of the British 8th army entered Empoli on Aug. 5, 1944, the Germans subsequently withdrawing across the Arno. Pop. 21,250.

**Empress.** Feminine of emperor. It is a corruption of the Latin *imperatrix* and is applied by courtesy to the wives of emperors, as well as to the few women who have ruled over an empire. Maria Theresa was an empress (Ger. *Kaiserin*), and Queen Victoria was empress of India. The women rulers of the Byzantine empire, Irene, for instance, and Catherine and Elizabeth of Russia, are also known in English as empresses. See Emperor; Sovereignty.

**Empress of Britain.** British liner of 42,348 tons completed in 1931 as flagship of the C.P.R.

Empress of Britain. C.P.R. liner sunk by the Germans in 1940

fleet. In 1939 she brought King George VI and Queen Elizabeth back to England after their tour in Canada and the U.S.A. On Oct. 25, 1940, the Empress of Britain was attacked by German bombers when 150 m. off the Irish coast. She was heavily damaged and taken in tow by Admiralty tugs, but on the night of Oct. 27 was sunk by a German submarine. Among the survivors was Gen. Legentilhomme (*q.v.*).

**Empress of Ireland.** Passenger steamer belonging to the C.P.R. On May 29, 1914, outward bound from Quebec to Liverpool with 1,367 people on board, the Empress of Ireland was rammed by the Norwegian collier, Storstad, in the St. Lawrence river during a fog. The liner sank in ten minutes, and 934 persons went down in her, including the actor Laurence Irving.

**Empson, SIR RICHARD** (d. 1510). English lawyer. Born at Towcester, Northants, he became M.P. for that county, and speaker of the house in 1491, and, knighted in 1504, was made chancellor of the duchy of Lancaster. A favourite of Henry VII, he col-

laborated with Edmund Dudley in that king's obnoxious fiscal policy, and became universally unpopular for his harshness. After Henry VIII's accession he was tried on a charge of constructive treason, attainted by parliament, Jan. 21, 1510, and beheaded with Dudley on Tower Hill, Aug. 17, 1510.

**Empyema** (Gr., suppuration). Collection of pus in the pleural cavity—that is, between the layers of membrane lining the chest wall and the lung. The condition may be due to infection from within, following simple pleurisy or septic pneumonia, or sometimes tuberculous broncho-pneumonia; less frequently to infections from without, as a result of fracture of a rib or a penetrating wound of the chest. The onset may be sudden, with pain in the chest, sweating and rise of temperature, but when, as usually, the condition develops in the course of simple pleurisy or a morbid condition of the lung, there is no marked line of separation in the symptoms.

Empyema is a serious condition, and if left untreated is likely to prove fatal. In mild cases it may be sufficient to draw off the pus by aspiration, but generally it is necessary to secure thorough drainage of the pleural cavity by making an opening between the ribs or removing a portion of a rib so that a large drainage tube can be inserted. This causes collapse of the lung on the affected side, but if the operation has been performed early there is a good prospect of the lung re-expanding after the discharge has ceased and the wound has healed.

**Ems.** River of Germany. It rises in Westphalia, in the Teutoburger Wald, and flows mainly in a N. direction through Westphalia and Hanover to the Dollart, an opening of the North Sea. Its length is about 210 m., and its chief tributaries are the Aa, Haase, Hessel, and Leda. It has been canalised as part of the system of German waterways. Emden is at its mouth. See Dortmund-Ems Canal.

**Ems.** German town and spa, on the river Lahn, 8 m. from its confluence with the Rhine S. of Coblenz. It has powerful and famous alkaline and ferruginous waters, used for drinking and bathing cures at least since the 14th century; the waters have a natural temperature of 85°–120°F., and were bottled and dispatched to many countries. A pleasant town of some 7,500 inhabitants,

Ems is situated between wooded hills offering attractive walks; it has a kursaal, theatre, many hotels and nursing homes, etc., and visitors staying for cure of cararrh, asthma, or diabetes between the two Great Wars averaged 10,000 a year. Ems passed from Hesse-Nassau to Prussia in 1866.

Ems, Germany. Town and bathing-place standing in the valley of the river Lahn

In 1786, by the Punctuation of Ems, the German bishops made an unavailing attempt to throw off their allegiance to the pope; and in 1870 the Ems Telegram (*v.i.*) provoked the Franco-Prussian War.

**Ems Telegram.** Message published by Bismarck in 1870 which was the immediate cause of the Franco-Prussian War. France had just succeeded in obtaining the withdrawal of Leopold of Hohenzollern as a candidate for the throne of Spain, but put forward a further demand. On July 13, 1870, Benedetti, the French ambassador, interviewed King William I, who was staying at Ems, and requested a promise that he would not allow the candidature to be renewed. The king refused, and later in the day declined to reopen the discussion. To Bismarck at Berlin he sent an account of the proceedings, and this was the Ems telegram.

Bismarck thereupon published the telegram with certain alterations, especially in that part of the message in which the king informed Benedetti that he could not discuss the matter further. These made it appear that instead of this being merely a courteous refusal to reopen the matter, it was a dismissal of the ambassador from his presence. Thus it was treated by France as a *casus belli*. The vital sentence was "His majesty refused to receive the French ambassador, sending word that he had nothing more to communicate."

**Emsworth.** Seaport of Hampshire, England. It stands at the mouth of the Ems, a small stream. It is 9 m. N.E. of Portsmouth, and has a railway station. The port has a coasting trade and oyster beds. Pop. 3,500.

**Emu** (Port., *ema*, ostrich) (*Dromaeus novae hollandiae*). Large bird belonging to the division Ratiatae. It is found only in Australia

and certain neighbouring islands. The second largest bird now living, it is exceeded in size only by the ostrich, which it somewhat resembles in general build. But the wings of the emu are more rudimentary, and the bird depends entirely on its swiftness as a runner to escape its foes. The slender feathers are brown, mottled with grey, but the younger birds bear longitudinal stripes of lighter colour. Emus are rare except in

Emu. Second largest bird known, it is peculiar to Australia  
Gambier Bolton, F.Z.S.

the wilder parts of the country, where they live in small flocks and feed chiefly upon small fruits. Although not web-footed, they swim well, and take to the water readily. They are hunted with dogs, and when brought to bay can deliver serious kicks. These birds are easily domesticated, and breed readily in captivity. The male, smaller than the female, incubates the eggs, which are green.

**Emulsin** (Lat. *emulsus*, milked out) OR SYNAPTASE. Name given to enzymes (*q.v.*) which hydrolyse glycosides of the beta series. Emulsin occurs in plants, *e.g.* fruit kernels, leaves, mould fungi, and bacteria. Its action on the amygdalin present in bitter almonds produces essential oil of

almonds in the process of manufacturing the expressed oil. Emulsin may be made from an aqueous extract of almonds by precipitation with alcohol and subsequent purification.

**Emulsion.** Substance formed when droplets of one liquid are dispersed in another liquid, each liquid being insoluble in the other. The addition of a third substance, called the emulsifying agent, is generally necessary to prevent the droplets from coalescing. The emulsifying properties of yolk of egg and gum arabic have probably been known to mankind for centuries. The number of emulsifying agents used in industry is being added to continually. They are used in agricultural sprays, in the textile and leather industries, in cleaners, soaps, cosmetics, and pharmaceutical preparations, foods, paints, and polishes.

A photographic emulsion is the term given to the light-sensitive layer either in the solid form on its support of glass, film, or paper, or in the liquid form before application thereto. It is more correctly described as a photographic suspension, being the dispersion of a solid in a liquid phase. The emulsifying agent is usually gelatine or collodion (*q.v.*). The essential constituent is one of the silver halides, chloride, bromide, or iodide, or a combination of these, precipitated in the dispersion medium. Sensitiveness to differing regions of the spectrum is attained by treatment of the emulsion with various dyes. After "ripening" and "digestion," two processes which affect contrast and other characteristics, the emulsion is cooled and set, being further modified before final coating. See Photography.

**Enabling Act.** Popular name for the National Assembly of the Church of England (Powers) Act, which became law in 1919. It was introduced by the archbishop of Canterbury, the object being to set up for the Church of England a national assembly with considerable powers for the government of the Church (see Church Assembly). The Act set up a roll of electors in each parish. (See Electoral Roll.) The various diocesan conferences elect the members of the house of laity. See Convocation.

**Enamel.** Transparent or opaque glassy substance applied to metal or other surfaces in the form of a paste and then fired to fix it. The material—ground very fine, mixed with gum, water, or oil of spike to

render it adhesive, and reduced to a pasty consistency—is brushed on to the object, which, when duly decorated, is placed in a furnace. In pots, pans, and culinary utensils an internal lining of enamel protects the iron body from oxidation when exposed to heat and wet or from corrosion by acids. The metal, after having been annealed to bear the heat, is dipped into the glaze and fired in a furnace at 1,500° F.

In the fine arts enamel is principally used in connexion with pottery and porcelain wares, jewelry, watches, snuff-boxes, plaques, and articles for the toilet table. The enamel may be applied by the enclosed method of *cloisonnée* (*q.v.*), the engraved or incised method or *champlevé*, and the surface method, in which the whole surface is covered with enamel on which the design is delicately painted and fired. Coloured enamels were used by the Egyptians, the Greeks, and Romans, but the art was brought to a high state of perfection under the Byzantine emperors. A special style was developed among the Orientals, while a kindred art of polychoured enamelling was carried out extensively in N. Europe. Of the surface style the enamels for which Battersea was noted in the 18th century are an example, while in Limoges enamel, which was a variety of surface work, painting was carried to rare perfection by the practitioners of the 16th cent. Copper was the metal most employed for this purpose, but gold and silver were sometimes used.

**Enare.** Lake in Finland, in the N. of the department of Oulu. It is fed by a number of rivers, and discharges its waters through the Pasvik into the Varanger Fiord in the Arctic Ocean. Its area is 550 sq. m. *Pron.* Enah-re.

**Enarea.** Plateau region of Abyssinia, S.W. of Shoa. It has hills attaining an elevation of 8,000 ft. above sea level, upon the slopes of which coffee grows in abundance. The people are an off-shoot of the Gallas. The chief town is Saka, near the Gibbe river.

**Enargite.** An orthorhombic copper mineral, chemically copper arsenic sulphide,  $\text{Cu}_3\text{AsS}_4$ , with minor amounts of antimony and iron. It occurs as greyish black tabular or prismatic crystals with a perfect cleavage; also massive or granular. Enargite is found typically in vein and replacement deposits formed at moderate temperatures with other copper minerals; e.g. at Butte, Montana.

**Encaenia** (Gr. *en*, in; *kainos*, new). Feast of dedication or renewing. It is used especially for an anniversary of the dedication of a church or temple. Among the Jews it is applied particularly to the anniversary festival of the dedication of the temple at Jerusalem. At Oxford university, Commemoration, the festival at the end of the academic year, when founders and benefactors are commemorated, is also known as Encaenia.

**Encalada**, MANUEL BLANCO (1790-1876). Chilean soldier and diplomatist. He was born at Buenos Aires, and having been educated at Madrid and the naval academy at Leon, returned to S. America, where he joined the revolutionary party. He was with Cochrane (10th earl of Dundonald, *q.v.*) in his Pacific campaign as commander of the Chilean navy. In 1853 Encalada was appointed Chilean minister to France. He died Sept. 5, 1876.

Enamel. 1. Gold brooch with bust in cloisonné enamel, Italian, c. 7th century. 2. Gold brooch of German make with Byzantine cloisonné enamels, 11th cent. 3. Enamelled cross, attributed to Godefroid de Claire of Huy, late 12th cent. 4. Ciborium of Limoges work, 13th cent. 5. Plate in brilliant colours of Limoges work, c. 1530. 6. Pillar candlestick, Limoges, c. 1560

**Encarnacion.** City of Paraguay. The capital of Itapua dept., it stands on the Paraná, 230 m. S.E. of Asunción, with which there is river connexion. It is the terminus of the Paraguay Central rly. and connected by ferry with Posadas in Argentina. The centre of the cattle industry, it produces hides, also yerba maté and tobacco, and has cotton gins, sawmills, and flour mills. Pop. 16,078.

**Encaustic** (Gr. *enkaustikos*, burnt in). Method of painting with colours and wax, said to have been invented by Polygnotus (5th century B.C.) and much practised by the ancient Egyptians and Greeks. Their technique is not definitely known, but it is surmised that coloured powder was mixed with white wax and kneaded into small cakes. When required metal disks with cuplike indentations were heated and a cake was laid on the palette, a different colour in each depression, and gradually melted. The process was rapid, for the wax, laid on with a brush, cooled quickly and the work had then to be touched again with moderately hot irons, which fused the tints.

**Encephalitis.** Inflammation of the brain. This may occur as a primary condition due to an attack by a virus as in encephalitis lethargica or sleepy sickness; or it may be the result of injury, spreading abscess, or syphilis. Headache, coma, irritability, convulsions, and vomiting are common to all forms. Paralysis and over-irritability of muscle groups localise for the physician the severity and site of the lesion.

Encephalitis lethargica is an infection of the nervous system by a virus which is believed to travel to the brain via the nerve fibres themselves. Thereupon the virus, unable to get out, is caged within the nervous system, where it may survive for long periods, giving rise to lapses of nervous balance. The onset has much in common with influenza. The disease never leaves the patient undamaged, and often there may be serious alteration in personality and deterioration of moral fibre.

Cerebral abscess is never a primary condition, but travels from some infective focus, frequently in the ear or throat, or from suppuration in the chest or distant bones. Injuries to the skull cause a percentage of these cases. Treatment is essentially surgical, but the sulphur group of drugs and penicillin are valuable wea-

pons against the staphylococci and streptococci, the main causative organisms.

**Encina** OR **ENZINA**, **JUAN DE LA** (c.1469 – c.1534). Spanish poet and dramatist. He was born perhaps at the village the name of which he bore, and educated at Salamanca university. His first plays were acted in 1492. When his Representaciones were performed before Ferdinand and Isabella and the court, he was secretary to the duke of Alba. In 1496 his plays, partly autos (*q.v.*) and partly secular, were published, and shortly after he went to Rome, where he became a priest and received an appointment in the pope's chapel. In 1519 he made a pilgrimage to Jerusalem, and published an account of it in 1521. He was made prior of Leon, and died at Salamanca. Founder of the secular drama, his contemporary popularity was such that six editions of his plays were produced between 1496 and 1516.

**Encirclement.** Term applied by German politicians to describe any alliance that tended to curb German aggressive expansion. The chancellor von Bülow was the first to raise the cry of encirclement, when in 1906 he promoted bills for the expansion of the German navy. Great Britain had striven to come to an agreement with Germany, and had turned to France and Russia only after Germany had repulsed all overtures and embarked upon a patently anti-British policy. The ties of the "encircling" alliance were really so loose that France and Russia were not sure whether Great Britain would support them at the outbreak of war. Hitler professed to see a renewed threat of encirclement in the British attempts to form an anti-aggression front in March, 1939, after the annexation of Czecho-Slovakia by Germany.

**Encke**, **JOHANN FRANZ** (1791–1865). German astronomer. Born in Hamburg, Sept. 23, 1791, he studied in Göttingen, and in 1822 became director of the Seeberg Observatory near Gotha. In 1825 he succeeded to the post of astronomer of the academy of science, and director of the Berlin Observatory, then in course of erection. In 1863 he retired into private life at Spandau, where he died, Aug. 26, 1865. Encke worked out, from the observations of the transits of Venus of 1761 and 1769, the first authentic value of the sun's parallax; determined the path of Pons' Comet; and

undertook the observation of another comet, since known by his name (*v.i.*).

**Encke's Comet.** On Nov. 26, 1818, Pons of Marseilles discovered an inconspicuous comet whose elements Encke calculated with the unexpected result of finding that it revolved about the sun in a period of 3½ years (1,208 days). It has been observed at over 40 returns since. The period is considerably shorter than that of any other known comet. Its outward journey takes it near the planet Jupiter, to whose family it belongs. Its unique point of interest is the steady shortening of its period, by about 2½ days in a century, which cannot be explained by the gravitational pull of any known body. It seems likely that near the sun it encounters a resisting medium which causes it to fall in towards the sun and thus to accelerate.

**Enclave** (Lat. *in*, in; *clavis*, key). Detached part of a country or state entirely surrounded by the territories of another. The name is used by the country owning the surrounding land, the separated tract being an exclave from the point of view of the country possessing it.

**Enclosures.** Word used specially for common land which is enclosed, *i.e.* converted by private persons to their own use. This practice began in England with the decay of the manorial system, when the lords of the manor frequently enclosed common land. From time to time there was an outcry against it, notably in Tudor times. Latimer referred scathingly to enclosures, while Somerset, acting for Edward VI, appointed a commission to inquire into the matter. The law about it during the Middle Ages was contained in the statute of Merton of 1235 which allowed the lords to enclose land, provided that they left sufficient common unenclosed to meet the rights of the commoners.

After about 1700, enclosures were made by special Acts of Parliament. The Acts distributed the land between the lord of the manor and the various persons who had rights in it. Between 1700 and 1845 there were about 4,000 of these Acts, under which about 5,000,000 acres were enclosed. In 1801 an Act ruled that the consent of three-fourths of the freeholders and copyholders of the manor was necessary before land could be enclosed. In 1845 the matter was put in the hands of commissioners whose business was to

examine suggested enclosures, and see that some part of the land was set aside for public purposes. About then the movement for the preservation of common land began. Suggested enclosures, the case of Epping Forest being the standing example, were prevented, and in 1876 an Act virtually put an end to the practice. In Scotland and Ireland the matter never attained the importance it did in England. See Commons; Manor.

**Encounter Bay.** Inlet of the coast of S. Australia, between Port Elliot on the N. and Jaffa Cape on the S. It is 90 m. across its entrance and is the last important indentation of the coast before the state of Victoria. Off the N.W. corner of the bay lies Kangaroo Island.

**Encratites** (Gr. *enkrateis*, self-controlling). Ascetic sect of the 2nd century. They taught the essential evil of matter and abstained from flesh, wine, property, and marriage. Encratite doctrines seem to have been first taught systematically by Saturninus early in the 2nd century, although the principle was combated already in I Timothy 4, and the sect became organized under the leadership of Tatian. Encratism spread widely in Asia Minor, and the apocryphal Gospel according to the Egyptians furnished some of its arguments. In the 4th century they became merged with Gnosticism and Montanism.

**Encrinites.** Popular name for the crinoidæ (*q.v.*).

**Encyclical** (Gr. *enkyklios*, circular). Eccles. term for a letter from a Church authority, not addressed to any particular individual or community. Thus the General Epistles of S. Peter and the pronouncements of councils which were sent forth to the Church at large were thus named. The term is now used for a communication of the Pope to the bishops generally on some ecclesiastical topic. It differs from a bull, since it does not deal with any special case, but indicates general principles to guide the bishops in dealing with important questions.

**Encyclopædia.** Word derived from the Greek (*enkyklios*, circular, complete; *paideia*, education). The spelling of the word without the diphthong is justified on grounds of scholarship, for the very first time the Greek form was rendered into English, *via* the Latin, the writer, Sir Thomas Elyot, in *The Governour*, 1538, spelt it *encyclopedie*. It has been approved by Dr. Johnson, Webster and other lexicographers. The word may be translated as the whole circle of knowledge. For long it expressed this idea to scholars trained in the tra-

ditions of Rome, but it was not used as the title of a book until the 16th century, some years after the invention of printing. Before then, however, many works had been written which may be fairly described as encyclopædias, for their authors claimed to give information about all the interests of the human mind.

The first of these known encyclopædias is the *Historia Naturalis* of the elder Pliny; and the Middle Ages saw the production of Etymologies by Isidore, bishop of Seville (d. 636); and of *The Origin of Sciences* by the Arab scholar, Alfarabi (d. 950); as well as of a number of less notable ones. The most outstanding encyclopædia, however, written in Latin, was by Vincent of Beauvais (d. c. 1264). It was called *Speculum Majus* (Greater Mirror), and is divided into four main parts, dealing with science, theology, history, and morality (the last section being possibly wrongly ascribed to Vincent).

The material in these encyclopædias was arranged according to subjects, not in alphabetical order, but some time after the invention of printing the advantages of the latter arrangement became manifest. About the same time, too, it was realized that if encyclopædias were to be read they must be written, not in Latin, but in a popular language. However, before these important changes came about J. H. Alsted, in 1620, had produced a Latin work of the old kind, notable because it was the first of any size to be called an encyclopædia. The two innovations just mentioned were both introduced to the world by a Frenchman, Louis Moréri. His *Grand Dictionnaire*, 1674, was an encyclopædia in the modern sense, although, like his immediate successors, he preferred to call it a dictionary. It was very popular, and so was that of Pierre Bayle, which in 1697 appeared as an improvement on Moréri.

The first encyclopædia written in English was the *Lexicon Technicum*, 1704, of the Rev. John Harris, though as early as 1398 John Trevisa had translated a Latin work of this kind into English. Harris was followed by a much greater name in the history of encyclopædias, Ephraim Chambers, the real originator of the modern work. In 1728 Chambers produced his *Cyclopædia: or Universal Dictionary of Arts and Sciences*. A little earlier an Italian, M. V. Coronelli, had begun a more ambitious work, but it was never completed. In 1732-54 was published

Zedler's *Great Universal Lexicon*, a German work ed. by J. A. Frankenstein and others, but usually known by its publisher's name.

The effects of Chambers's work were felt in France. It was translated into French, and on it was founded the most celebrated of all encyclopædias, the *Encyclopédie*, which, edited by Diderot and D'Alembert, counted Voltaire and Rousseau among its contributors. Neither Chambers's nor the *Encyclopédie* included biographies, although Moréri and other earlier writers had done so.

The British counterpart of the *Encyclopédie* was the *Encyclopædia Britannica*. The first edition of this, ed. W. Smellie, appeared in three volumes in 1771. From it biography and history were excluded, but both appeared in the second and subsequent editions. Throughout the 19th century further editions appeared, to which leading scholars contributed. The 11th edition, by the Cambridge University Press, was published 1910-11; the 14th edition (New York) began to appear in 1929.

Meanwhile a host of other encyclopædias appeared in Great Britain and abroad. In France there was *La Grande Encyclopédie*, also that of Larousse; in Germany the *Konversations-Lexicon* of Brockhaus and that of Meyer; in the U.S.A., the *New International*; and many others. Among the English works of the kind were *The Penny Cyclopædia* of Charles Knight, 1833-43, and the one issued by the Edinburgh firm of Chambers in 1859-68, and several times revised.

At the end of the century a gigantic and novel advertising campaign carried on by *The Times* in order to sell the ninth and tenth editions of the *Britannica* had an enormous effect in popularising the work and in stimulating a demand for books of this kind. This was seen in 1905-06, when *The Amalgamated Press* put upon the market *The Harmsworth Encyclopædia*. Sold in fortnightly parts, this was an unprecedented success. Recent years have witnessed the output of a host of encyclopædias devoted to a single branch of human knowledge—theology, sport, agriculture, education, for examples; but none has ever attained such worldwide circulation as *THE UNIVERSAL*, first serially issued 1920-22, and now after several revisions appearing in this new form.

**Encyclopédistes.** Name given to the contributors to the *Encyclopédie* edited by D'Alembert and Diderot. They were writers of high repute in literature and philosophy,

including Rousseau, Grimm, Voltaire, Baron d'Holbach, and the two editors. Several of the encyclopédistes held advanced views on political and social matters, besides being sceptics with regard to Christianity, and this was reflected in much that they wrote. The influence thus exerted by the *Encyclopédie* upon the minds of the educated classes helped to ripen French public opinion in favour of the Revolution.

**Endecott, JOHN** (1589-1665). English colonial governor. Born at Dorchester, Dorset, he sailed

to N. America in 1628 and became manager of the Naumkeag (now Salem) plantation. Being superseded by John Winthrop, he employed himself in fighting the Indians. In

1641 he was made deputy-governor of Massachusetts and three years later became governor, a post he held with intervals until his death at Boston, March 15, 1665.

**Endemic** (Gr. *endēmos*, native). Biological term applied to an organism which is found only in a particular region. It is also applied to diseases which are always more or less present in certain localities, as distinguished from epidemic diseases which may be widely prevalent at one time and completely absent at another. See Disease; Public Health.

**Enderbury.** For this Pacific island, see Canton and Enderbury.

**Enderby Land.** Desolate tract of Antarctica. It extends S. from the Antarctic Circle, in lat. 50°-55° E. It was discovered by John Biscoe in 1831, who named it after his employers, Enderby Brothers.

**Endive** (Lat. *intibus*). Plant of the same genus as chicory (*q.v.*).

**Endocardium** (Gr. *endon*, within; *kardia*, heart). Smooth membrane which lines the interior of the chambers of the heart. Inflammation of this membrane is termed endocarditis. See Heart; Rheumatic Fever.

**Endocrinology** (Gr. *endon*, within; *krinein*, to sift; *logos*, science). The study of the glands of internal secretion. These manufacture hormones which pass into the circulation, pervade the organism and affect various cells and tissues. The endocrine system is one of the body's two main regulating mechanisms, the other

being the nervous system. It is an example of humoral and chemical control.

Ductless glands, as they have been called, must be differentiated from other glands, particularly those which pass an external secretion down a duct to the site of its activity, *e.g.* the salivary glands; and also from the lymphatic glands which are an integral part of the lymph system and defence mechanism of the body.

Hormones (Gr. *horman*, to rouse) are physiologically active chemical substances. In most instances the action of the hormone is excitatory. An endocrine gland is usually both factory and warehouse for its hormone, as the latter is not stored elsewhere in the body for any length of time. The functions of these glands have been studied by their removal in animals, by the administration of gland extracts, and by observations on human beings in whom one or other gland is known to be over- or deficiently active. Of recent years, the active principles of a number of these hormones have been isolated and their actions studied. A considerable body of knowledge has been built up, and this has been of great value in the understanding of human endocrine abnormalities and disease.

In disease an endocrine gland may produce an excess or a deficiency of hormone. Such conditions can be recognized by characteristic symptoms. Deficiency can be corrected by hormone treatment in the form of gland extract or of active hormone. Hormones, when so administered, do not stimulate the gland which is deficient, but make up the deficiency. The process, therefore, is one of

substitution rather than stimulation.

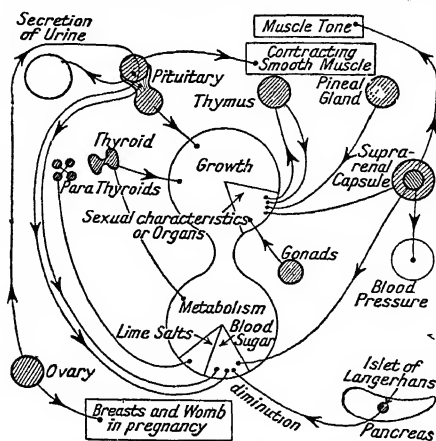

The target of the hormone is some tissue, cell or end organ which it should stimulate; but in some diseases the end organ may not be able to react to stimulation. The target or end organ for a hormone may be another endocrine gland, in which case the hormone is called trophic. The destruction of the gland which produces the trophic hormone will cause failure of the target gland. By the action and interaction of the various endocrine secretions, an elaborate system of humoral control is established. This mechanism plays an essential part in the regulation of the various bodily processes of growth, development, and metabolism.

The chief members of the endocrine series are the pituitary, thyroid, parathyroids, adrenals (or suprarenals), islet of Langerhaus (in pancreas), and sex glands. With the exception of the thyroid and the male sex glands, most are located in inaccessible sites, the pituitary lying in a small bony cavity at the base of the skull, the adrenals and the pancreas on the back wall of the abdominal cavity, whilst the parathyroids lie behind the thyroid at the root of the neck.

Functionally, they can be considered in two main groups: those concerned with growth, development and reproduction on the one hand, and those concerned with metabolism on the other.

The anterior lobe of the pituitary secretes a growth hormone. In every organism there is an inherent tendency to grow, and genetic influences no doubt play the most important part in determining the stature of human

beings. On the other hand, this is influenced by the growth hormone of the pituitary, which acts by stimulating the growth cartilages of the bones. Development, and particularly development of the secondary sex characters in each sex, is due to the specific hormones of the sex glands. They are also responsible for reproduction—spermatogenesis in the male and the development of the ovum and follicle in the female. Both development and reproduction are under the control of the pituitary

Endocrinology. Diagram showing the main glands of internal secretion and their action

through its gonadotrophic hormones. Certain cells of the adrenal cortex, closely related to the sex glands, have an androgenic influence and, if present in the female, have masculinising effects.

The thyroid controls the general level of oxidative processes or basal metabolism of the body. From the raw material iodine, it produces its hormone, thyroxine, a metabolic stimulant.

Of the glands concerned with more specific metabolic processes, the pancreas, through its islet tissue, produces insulin which controls the utilisation of carbohydrate in the body and its storage in the muscles and liver. Water metabolism is controlled by the posterior pituitary which produces an anti-diuretic hormone controlling the output of water from the kidneys. The parathyroids and adrenal cortex regulate the inorganic constituents and electrolytes of the body. The parathyroids are concerned with calcium and phosphorus metabolism and determine the output of these substances from stores in the bones. Calcium and phosphorus are important in the structural stability of the skeleton and the functional stability of the nervous system. The adrenal cortex regulates sodium and chloride metabolism and controls the output of these substances from the kidneys. Sodium and chloride are essential to the maintenance of water balance in the body. With deficiency of cortical hormone, there is a leak of sodium and chloride from the kidneys.

The adrenal medulla has an emergency function and produces adrenalin. This accelerates the heart rate and amplifies heart action. In other ways it mobilises energy and prepares the organism for action.

The pituitary has been called the master gland owing to its central position and trophic hormones. In addition to the functions mentioned, it controls the thyroid, adrenals, probably pancreas, and possibly other glands. It is closely connected at the base of the brain with nerve centres integrated with higher levels of the nervous system. The two main controlling mechanisms of the body—nervous and endocrine—thus function together.

H. Gardiner Hill

**Endoderm.** The innermost of the three layers into which the walls of a gastrula can ideally be divided. It forms the gut and its derivatives. *See* Gastrula.

**Endogamy** (Gr. *endon*, within; *gamos*, marriage). Primitive institution binding a man to marry within his own social group only. The best developed example is the Hindu caste, with exogamous clans or gotras. *See* Family; Marriage.

**Endolymph** (Gr. *endon*, within; Lat. *lymp̄ha*, water). Anatomical term denoting the fluid which occupies the interior of the membranous labyrinth of the ear of higher animals. *See* Ear.

**Endometritis** (Gr. *endon*, within; *mētra*, womb). Inflammation of the membrane lining the interior of the uterus or womb. *See* Womb.

**Endophyte** (Gr. *endon*, within; *phyton*, plant). Name given to a plant which lives in other plants. *See* Fungus; Parasite.

**Endoplasm.** The inner, more granular, part of the cytoplasm of such an animal as amoeba. It is probably normally in the physical condition of a sol, distinguished from the ectoplasm which, covering the surface, is probably normally a gel. It seems likely that the one can become the other by thixotropic change.

**Endor.** Village of Palestine, now known as Endur, about 6 m. S.E. of Nazareth and close to Mt. Tabor. It was the home of the witch whom Saul consulted.

**Endorsement or ENDORSEMENT** (Lat. *dorsum*, back). Something written on the back of a document. Its most familiar form is that of the signature which must be put upon the back of a cheque, bill of exchange, etc., when it is passed from one person to another. The endorsement must correspond with the name on the front or it will be irregular. By endorsing a cheque or bill the owner transfers his rights to another.

**Endosperm** (Gr. *endon*, within; *sperma*, seed). Tissue found in the seeds of Gymnosperms and many flowering plants, and in spores of selaginella. In the pines (Gymnosperms) the endosperm is formed before the embryo comes into existence; in the flowering plants proper (Angiosperms) embryo and endosperm are formed simultaneously. If a longitudinal section is made of a ripe pine-seed, for example, the embryo will be found to occupy a central cavity, surrounded by a mass of cellular tissue. This is the endosperm, which is gradually absorbed as food by the developing embryo or seedling to tide over the critical period in which it is establishing its roots and expanding its first leaves.

**Endothermic and EXOTHERMIC COMPOUNDS AND REACTIONS.**

Terms used in chemistry to distinguish between compounds which are formed from their elements with the absorption of heat (endothermic) and compounds formed from their elements with the evolution of heat (exothermic). Carbon disulphide is an endothermic compound; carbon dioxide an exothermic compound. An endothermic reaction is a chemical change that requires heat in order to take place; an exothermic reaction is one that evolves heat. If sulphur trioxide is added to water, sulphuric acid is formed with evolution of heat; if sulphuric acid is mixed with water, a hydrate of sulphuric acid is formed with evolution of heat; both these are exothermic reactions. The endothermic compounds are in general less stable than the exothermic ones. The reduction of iron in blast furnace is an exothermic reaction, heat being evolved in the process. The formation of nitroglycerine is an endothermic process and nitroglycerine an endothermic compound.

**Endowment** (Lat. *dos*, a dowry or gift). Gift of money or land to which the idea of permanence is attached. Endowments indicate the vast amounts that have been given or bequeathed for the support of churches, colleges, schools, hospitals, and charitable institutions of all kinds. In the U.K. ancient endowments are under the general control of the state, acting through bodies appointed to supervise them. Such are the Church Commission that controls the endowments of the Church of England, and the Charity Commission that controls funds left for almshouses, hospitals, and the like. Endowed schools are under the supervision of the Minister of Education. The process of time frequently makes trusts governing old endowments quite out of keeping with the age, and so from time to time parliament has dealt with the matter. Thus the Endowed Schools Acts of 1869-89 removed many abuses and gave these trusts a more modern spirit.

**Endurance.** In mechanics, the quality of a material which allows it to sustain the stresses to which it may be subjected. In fatigue testing, to which the term particularly relates, the endurance of a specimen is the number of repetitions of the applied stress cycle which have been sustained at the moment of fracture. The value of the stress range which is then just insufficient to cause fracture is known as the endurance limit.

This endurance limit, or fatigue limit, is often expressed as a ratio of the ultimate strength of the material under test, this ratio being known as the endurance ratio.

**Endymion.** In Greek mythology, a youthful shepherd of great beauty. Of him the moon-goddess Selēnē became enamoured, as he lay asleep on Mt. Latmos in Caria. Selēnē caused him to sleep for ever, so that she might be able to visit him and kiss him every night without his knowing it.

**Endymion.** Poetic romance in four books of rhymed couplets by John Keats, first published in 1818. A rhapsodical rendering of the classic story of the beautiful youth who inspired love in Cynthia, it is full of poetic riches, both of language and of thought. Its opening line "A thing of beauty is a joy for ever," has become one of the most familiar of quotations.

**Endymion.** Novel by Benjamin Disraeli, earl of Beaconsfield, first published in 1880. It is a presentation of political and social life in England during the middle of the 19th century, opening with the death of Canning and passing lightly through the Reform period. Though the story is slight, the characterisation is brilliant; and the narrative has much of the sparkle and less of the ornateness of Disraeli's earlier novels. Many of the characters were but thinly disguised delineations of actual people of the period, Lord Palmerston, Lady Jersey, and others.

**Enema** (Gr., injection). Fluid injected into the rectum. Enemata are used for washing out the rectum to relieve constipation, when they usually consist of a pint or more of soap and water, or of oil to soften the faecal mass. Substances such as quassia may be thus introduced into the bowel for the destruction of thread worms. Normal saline may be run in with a view to its absorption in a dehydrated patient who cannot swallow fluid, and in such cases nutrient substances such as raw egg, glucose, or peptonised milk may also be used.

**Enemy** (Lat. *inimicus*). Generally one who is antagonistic or hostile. In time of war, however, it has a special and narrower meaning referring to the state and its subjects with which another state is at war. By the laws of war these are on a very different footing from friends or neutrals. Their persons and property can be seized, and freedom of movement denied to such of them as are on the soil

of the country with which they are at war. They become enemy aliens, sharply distinguished from friendly or neutral aliens.

**TRADING WITH THE ENEMY.** At least since the Napoleonic wars it has been recognized as vitally

Endymion. Greek statue of the sleeping shepherd in the British Museum

important to prevent the enemy obtaining goods, credit, and other resources which will help him in carrying on war. Before 1914 trading with the enemy was forbidden and made a criminal offence by English common law. In most other branches of the law, the test whether or not a person is an enemy is his nationality; but this test would not be satisfactory in connexion with trading with the enemy, as the objects of the law would not be achieved if persons in England were forbidden to trade with enemy nationals but free to trade with persons resident in enemy territory who were of neutral or even British nationality. In this connexion, therefore, enemy means any person of whatever nationality residing in any territory occupied by the enemy. It was held by the house of lords in 1943 that a Dutch trader in Holland during the German occupation was an enemy, even though he might be bitterly opposed to the Germans and was trading merely to make a living.

During both Great Wars, legislation was passed under which any person—whether of enemy or of neutral nationality or even a British subject—might be deemed by order in council to be an enemy. The names of such persons were placed on a black list. Common law rules, found insufficient, were also widely supplemented. The Trading with the Enemy Act, 1939, as amended by Defence Regulations, gave extensive administrative powers to the Board of Trade and the Treasury. Where any business in Great Britain was suspected of trading with the enemy it could be inspected and its affairs supervised by the Board of Trade; any business carried on by or under the direction of an enemy or

enemy national could be controlled and wound up by the Board. Custodians of enemy property were appointed with the right to recover all sums due to an enemy. The Act of 1939 was not passed as a temporary wartime measure. The maximum penalty for trading with the enemy is seven years' penal servitude.

**Energiser.** Material used in the carburising process to accelerate the rate of adsorption of carbon by the steel being carburised. Energisers usually consist of metallic carbonates, chiefly those of sodium and barium, added to the carburising compound to the extent of 5 to 20 p.c. by weight. They act by decomposing to give off carbon dioxide gas, which reacts with the carbonaceous matter in the carburising compound to form carbon monoxide gas. Some regard these carbonates as reacting with carbon monoxide gas and producing by catalytic decomposition a reactive form of carbon, which is absorbed rapidly by the steel. Accelerators are also employed in other processes, such as cyaniding, chromium deposition and vitreous enamelling.

**Energy.** Term in physics often defined as capacity to do work (*q.v.*). It can be thought of either as accumulated work, or as "what is used up when work is done." In mechanics energy is measured as the product of the force acting and the distance (in the direction of the force) through which it acts. The units are the units of work. Thus if a vertical force raises one pound weight through one foot the energy expended (and also the work done) is one foot-pound. In the C.G.S. system the unit is the erg, equal to one dyne acting through one cm; in the F.P.S. system it is the foot-poundal. Since the erg is very small, a practical unit, the joule, is used, equal to  $10^7$  erg.

Mechanical energy can take two forms: (1) kinetic energy, possessed by a moving body because of its motion (it is the kinetic energy of a running billiard ball which enables it to knock another one on): this is equal to  $\frac{1}{2}mv^2$ , where  $m$  is its mass and  $v$  its velocity; (2) potential energy possessed by a body because of its position (it is the potential energy of a clock weight which is eventually expended in driving the clock): this is equal to the work which would be done in moving the body to its actual position from a natural position

of rest. If (unlike the clock weight) it is allowed to relapse freely to its position of rest, it will progressively lose potential energy and acquire a corresponding amount of kinetic energy.

It took many years for the important distinction between force and energy to be realized, and to some extent the progress of physics was held up until Kelvin suggested and defined the term in 1851. Meanwhile, it was gradually established that quantities such as heat (as distinct from temperature), electric current, and radiation are also forms of energy, and that energy may be stored up in chemical compounds and released or absorbed by chemical reactions. Between 1845 and 1850 Joule conducted a series of experiments, in which he heated water by stirring it with paddles driven by weights falling through a known distance, and found that it always took 772 foot-pound of energy to raise 1 pound of water through 1° F. This gives for the relation known as Joule's equivalent, or the mechanical equivalent of heat,  $J = 4.153$  joule per calorie. The modern figure, from more accurate electrical experiments, is about 4.1855 abs. joule per 15° cal. From the discovery of this fixed relation the whole science of thermodynamics (*q.v.*) developed and the principle of conservation of energy became firmly established.

Joule converted mechanical energy to heat. A steam engine converts chemical energy in the coal to heat, and the heat in turn to mechanical energy. In most steam engines only about 15 per cent of the chemical energy is recovered as mechanical energy; the rest is dissipated in furnace heat that does not reach the water, in steam pressure not applied to the pistons (e.g. escaping in the blast), in overcoming friction, etc. An electric generator may convert potential energy in high lying water into electric current, which may then be used to produce heat, light, or mechanical energy. Heat, however, which is the kinetic energy of the rapidly moving molecules, can be converted into mechanical or electrical energy only if there is a difference of temperature; otherwise there is no way of harnessing the individual molecules. Hence Kelvin's distinction between "available" and "diffuse" energy, and the modern conception of entropy (*q.v.*).

Einstein's Special Theory of Relativity suggested that mass

might be convertible into energy on the basis of the relation  $E = mc^2$ , where  $E$  is the energy,  $m$  the mass, and  $c$  the velocity of light. This has since been found to take place in atomic disintegrations, where the mass of the original nucleus is greater (by about 8 parts in 10,000) than the sum of the masses of the nuclei formed. The disappearance of 1 gm. of mass produces  $8.99 \times 10^{20}$  erg of energy. In atomic physics, however, it is convenient to use another unit, the electron-volt (e.V) equal to the energy acquired by one electron accelerated through one volt: 1 e.V. =  $1.601 \times 10^{-12}$  erg; 1 M.e.V. =  $10^6$  e.V.

**Enfantin**, BARTHÉLEMY PROSPER (1796-1864). French Socialist. Born in Paris, Feb. 8, 1796, he was educated at the École Polytechnique. In 1825 he met Saint-Simon and adopted his teaching, which he and Bazard disseminated during the next five years. In 1832 he was sentenced to a year's imprisonment for his public advocacy of free love. After a journey to Egypt he was appointed postmaster of Lyons, and in 1845 became a director of the Paris-Lyons rly. He died in Paris, Aug. 31, 1864. Enfantin's principal works are *Doctrine Saint-Simonienne*, with Amand Bazard, 1830; *Économie Politique*, 1831.

**Enfield**. Urban dist. and parl. div. of Middlesex, England. It is 10½ m. N. of London by rly; the Piccadilly line also serves its W. part, although the station (Oakwood) lies just beyond the boundary. The New River intersects the town. The chief building is the parish church of S. Andrew, parts of which date from the 12th century, and which contains the beautiful 15th century Tiptoft brass. The palace, built by Edward VI for his sister Elizabeth, has been demolished, but the panelling, a chimney piece, and a ceiling were transferred to Little Park. The grammar school was founded in 1557. The King and Tinker inn is associated with James I. Near the Ridgeway and the residential W. portions of the dist. a large area forms part of London's green belt. The E. of the district is populous, with an electrical industry. At Enfield Lock is the Royal Small Arms Factory, erected in 1856. Two M.P.s are returned. Enfield is mentioned in Domesday Book as Enefelde. Edward VI and Queen Elizabeth lived here, and Enfield Chase, disforested in 1777, was a favourite hunting ground of

James I. It has associations with Keats, Marryat, Isaac D'Israeli, and Lamb. Pop. est. 100,000.

**Enfield Rifle**. Weapon issued to the British army in 1852 to replace the Minie rifle, and used in the Crimean War. The original Enfield rifle was a muzzle-loader, but in 1866 it was converted to breech-loading. The barrel was 29 ins. long, the rifling consisting of five grooves with a twist of 1 in 48; it fired a hollow-based bullet. The rifle had a range of 1,000 yds. It was replaced in 1888 by the Lee Metford. *See Rifle*.

**Enfilade** (Fr. *enfiler*, to thread). Military expression which indicates fire along the direction of the enemy's line or trenches, i.e. from a flank. It robs the defenders of an entrenched position of their cover unless the line is well traversed; and few weapons in the line can be brought to bear to counter it. If a unit in action has to change its front it runs grave risks of coming under enfilade fire at once. The advantage of gaining a position on the enemy's flank when attacking is enhanced by the opportunity it gives of subjecting him to enfilade fire. In defensive positions machine-gun posts are sited on the flanks to bring enfilade fire upon troops making a frontal assault. *See Artillery*; *Tactics*.

**Enfleurage**. Extraction at ordinary temperatures by a non-volatile solvent of the perfume of delicate flowers. The solvents generally used are the finest lard, olive oil, and sometimes high quality mineral oils. The flowers are added to the melted fat or warmed oil, and the mass is stirred to assist extraction. In cold enfleurage fat is spread on both sides of a sheet of glass surrounded by a wooden frame (chassis), the flowers being spread on the upper surface. Charged frames are built up so that a chamber is formed of which the top and bottom faces are covered with fat. From the products of enfleurage perfume materials are prepared by extraction with alcohol. The process is carried out at Grasse, the centre of the French perfumery industry.

**Engadine**. Upper portion of the Inn valley, Switzerland, in the canton of Grisons. Divided into the Upper and Lower Engadine, it stretches 60 m. between two chains of the Rhaetian Alps, and is 1 m. to 1½ m. broad. From Martinsbruck, on the border of Tirol, it runs S.W. up to the Maloja Pass, traversed by a good carriage road, and there are rlys. to St. Moritz and Pontresina. The

Engadine. Village of Samaden in the Upper Engadine, with the Piz Rosatsch on the left

Upper Engadine has a series of small lakes and is more frequented than the Lower Engadine, which, however, has the attraction of its mineral springs at Schuls. The sides of the surrounding mts. are covered with pine forests to the height of 7,200 ft. The strong, bracing air of the valley renders it an extremely popular health resort. The inhabitants, mostly Protestants, still speak Latin or Romansch, a speech akin to Italian and French.

**Engagement.** Word meaning originally to bind by a gage or pledge, and used in several senses. It means an undertaking to marry and also a more general kind of pledge—e.g. an engagement to pay a debt or to meet a friend. It is also used as a synonym for a battle; this comes from an old meaning of engage, that of joining or fastening, as when, in architecture, two beams engage or interlock.

Historically, the Engagement is the agreement signed, Dec. 26, 1647, by Charles I and the Scots represented by the marquess of Hamilton. Charles was a prisoner at Carisbrooke, and he agreed, in return for Scottish assistance in restoring him to the throne, to establish Presbyterianism in England. See Charles I; Civil War.

**Engelberg.** Village of Switzerland, in the canton of Unterwalden. It stands at the N. foot of the Titlis, 14 m. by electric rly. S. of Lucerne. It is a favourite summer and winter tourist resort, with numerous hotels and boarding-houses and an English church. The abbey church is interesting; and the library has 20,000 vols. and 210 MSS. The large Benedictine abbey, founded 1120, was rebuilt in 1729; it has a school and its farm is noted for its cheeses. Engelberg owns common lands, which help to maintain its poor.

Engels, FRIEDRICH (1820-95). German Socialist writer. Born at Barmen, Prussia, Nov. 23, 1820,

he was the son of a cotton spinner. He visited England in 1842 and lived in Manchester from 1850 and in London from 1870 until his death, Aug. 5, 1895. He was corresponding secretary of the International Working Men's Association, or the International, for

Friedrich Engels, German Socialist

Italy, Spain, and Belgium, an organization formed in 1864 with the object of ending war and subordinating capital to labour. Engels was the friend of its moving spirit, Karl Marx, with whom he collaborated in the communist manifesto of 1847. Engels' works include *The Condition of the Working Classes in England*, 1845, Eng. trans. repr. 1920; and *The Origin of the Family, Private Property and The State*, 1884. *Consult* Life, G. Mayer, Eng. trans. R. H. S. Crossman, 1936.

**Enghien, LOUIS ANTOINE HENRI DE BOURBON CONDÉ, DUC D'** (1772-1804). French nobleman. Born at Chantilly, Aug. 2, 1772, he entered the army in 1788. In 1792 he held a command in the royalist army

raised by his grandfather, the prince of Condé, fighting against the republicans until the peace of Lunéville, 1801. In 1804 he was falsely accused of having taken part in the Cadoudal-Pichegru conspiracy against Napoleon, was seized in the neutral territory of Baden, hurried to Paris and, after a mock court-martial, was shot at Vincennes, March 21, 1804. The murder of the duc d'Enghien, a crime from which Napoleon vainly tried to exculpate himself in St. Helena, occasioned the famous saying of Fouché: "It was worse than a crime; it was a blunder."

**Engine** (Lat. *ingenium*, skill). Appliance for converting energy in the form of heat, or less usually a head of water, into work. In general the heat is first produced by the combustion of some form of hydrocarbon fuel (coal, gas, petrol, or oil) and this is converted into pressure energy either externally to the engine (as in steam engines) or internally (as in gas, petrol, and oil engines). Using the name in its modern sense, an engine has to repeat the same cycle of operations at regular intervals (as with reciprocating engines) or to apply a continuous torque to a rotating shaft by means of jets of fluid (as with steam turbines or gas turbines).

The earliest engines used steam as a working agent. Hero of Alexandria (c. 5 B.C.) used the reaction of jets of steam issuing from a series of nozzles to produce rotation of a globe carrying the nozzles. Branca (1619) used the momentum of a jet issuing from a stationary nozzle and impinging on vanes fixed to the circumference of a rotating wheel. Savery (1698) utilised the pressure of steam acting on the surface of the water to pump water a height of 100 ft. The first practicable reciprocating engine for pumping water from mines was New-

comen's (1712); steam on one side of a piston was condensed, forming a partial vacuum and allowing atmospheric pressure on the other side to overcome the external resistance. Watt (1765) improved the economy of the engine by adding

Engelberg. The Swiss village at the foot of the Titlis Alp

a separate condenser to it and later (1770) utilised the pressure of the steam. Invention of the crank (1781) enabled reciprocating motion to be changed into rotary motion. Trevithick (1800) and Stephenson (1814) applied the engine to locomotives, including slide valves and reversing gear. Symington (1802) constructed the first marine engine. Further developments in steam-engines, including compound expansion (1845), were applications of scientific methods, precision machines, and new materials, until Parsons (1890) invented the steam turbine.

About 1670 Huygens experimented with gunpowder in a cylinder fitted with a piston. In 1820 Farish designed and constructed a small engine to work with gunpowder, but no successful outcome is recorded. Cecil, in 1820, constructed what appears to be the first working gas-engine, using an explosive mixture of hydrogen and air. The free piston engine of Otto and Langen followed, and in 1860 the Lenoir engine, using a mixture of gas and air without compression. De Rochas stated the procedure to be followed by an economical engine, and Otto constructed engines working on his four-stroke cycle. In 1878 Clerk made the first engine working on the two-stroke cycle. Daimler was the earliest to experiment with fast-running petrol engines and in 1883 a De Dion car was fitted with a petrol engine running at 800 r.p.m.

Priestman's, of Hull, were the first firm to use paraffin as a fuel for engines (1885). Diesel published *The Rational Heat Motor* in 1893, and the first successful Diesel engine was built in 1897. Lastly, the combustion gas turbine has made rapid strides in efficiency, and its future commercial operation in large units is assured. See Diesel Engine; Gas Engine; Gas Turbine; Internal Combustion Engine; Locomotive; Oil Engine; Steam Engine; Steam Turbine; Two-stroke Cycle.

A. T. J. Kersey

**Engineer Admiral.** Highest commissioned rank in the engineering branch of the Royal Navy. An engineer admiral's rank is indicated by one broad gold band below three narrow gold stripes, the band and stripes being separated by stripes of purple cloth. Large naval dockyards are generally under an engineer admiral, who is responsible for the running of workshops and repair of warships.

## ENGINEERING: A GENERAL SURVEY

A. H. Gibson, D.Sc., Prof. of Engineering, University of Manchester

*This article states the history of and relationship between military, civil, mechanical, and electrical engineering, and outlines an engineer's duties and studies. See also articles on the various branches of engineering activity, e.g. Bridge, Dam, Electronics, Engine, Road, etc.; and biographies of famous engineers*

Historically considered, engineering is the earliest of the arts, emerging in the dawn of civilization when the first tool was made by man. Little is known as to the earliest development of engineering knowledge. It must have been of a comparatively high order to render possible the construction of the monumental works of Egypt and the East, and the priests of many of the ancient religions probably had an expert knowledge of some branches of mechanics. The aqueducts and bridges built by the Romans, and the remains of metal pumps of the Roman period, show that the principles of civil, mechanical, and hydraulic engineering were well understood before the Christian era.

In England the term engineer as defining an occupation appears to have dated from the 13th century. In the wardrobe account of Edward I (1300) occurs a statement of sums paid to engineers for military artificer's work. In 1344 the army records note the number of engineers on the strength of the ordnance. Their duty was not only to direct warlike engines and weapons, a duty afterwards delegated to the artillery, but also to undertake the design and construction of fortifications, roads, bridges, machinery, and other works of military service.

### Beginnings of Civil Engineering

About the 12th century public attention in France became directed to the internal communications of the country, and an association was formed under the name of the Frères Pontiers with the main object of building bridges. The association was extended throughout Europe, and it built the first stone London Bridge, perhaps the earliest example of a definite body devoting itself to civil engineering works.

The birth of civil engineering in its modern sense was at the beginning of the 17th century. The rivers of N. Italy, which had been in use for navigation and regulated for irrigation from early times, appear to have relapsed into a bad state of order, with the result that many disastrous inundations took place. The most learned scientific men of the day were called into consultation,

which led to studies and experiments. A class of practitioners was called into existence capable of dealing with hydraulic works and with their necessary mechanical arrangements, and the scope of their work was gradually extended to cover also the design and construction of roads, bridges, docks, workshops, and machinery in general. As this class of work was analogous to that allotted to engineers of the military service, the new profession adopted the title of engineer, prefixing the word civil to distinguish its members from their military brethren.

Probably the best definition is that used by the Institution of Civil Engineers, which defines engineering as "the art whereby the great sources of power in nature are converted, adapted, and applied to the use and convenience of man"—which covers all activities of the engineer, whether civil, mechanical, or electrical.

### Mechanical and Electrical Branches

The development of the steam engine led to an enormous and rapid expansion in the branch of civil engineering devoted to the design and construction of motive-power machinery and mechanical appliances, and to the development of manufacturing processes. From this period dates the professional term mechanical engineer. Later, the development of the electric dynamo, and of all the electrical appliances and accessories to electric power and lighting, rendered this sub-branch of mechanical engineering sufficiently important to justify the professional title of electrical engineer.

With further intensive specialisation, aero engineering, agricultural engineering, chemical engineering, and metallurgical engineering are now to all intents and purposes separate professions. In general the term civil engineering is confined to the design and construction of such works as roads, bridges, rlys., docks, harbours, canals, dams, and coast defences, all of which are essentially of a stationary character.

The scientific study of engineering principles is of comparatively recent growth. The first engineering school attached to any university in the United Kingdom was

founded at Glasgow. This was quickly followed by similar schools at other universities, and a training in the profession can now be obtained at any university or technical institute in the kingdom. In mechanical engineering, great developments have taken place in the branch of internal-combustion engineering, using petrol and heavy oils; in steam and internal-combustion turbines; and more recently in jet propulsion for aeroplanes. For many purposes the turbine has supplanted the steam engine, on the use of which the industrial revolution was based.

Developments in the use of atomic energy indicate that engineers may be able to utilise this in prime movers, probably mainly for providing the energy for steam raising in comparatively large plants for generating electricity.

In electrical engineering the development of high-tension overhead transmission lines has rendered it possible to harness large waterfalls and other sources of water-power remote from any industrial centre, and to transmit this energy, developed by the use of hydraulic turbines coupled to electric generators, to be used at the most convenient site. In the U.S.A. and Canada such transmission lines, some of them exceeding 200 m. in length, have long been in use. In view of the success of these systems, of the comparative cheapness with which water-power can be developed, and of the rising cost of coal, great interest is being taken in the harnessing of water-power in most countries of the civilized world, and such hydro-electric development has provided an interesting chapter of engineering history. The increase in the cost of fuel is likely to accelerate the development of hydraulic resources, and has rendered possible the development of tidal power at such sites as the Severn estuary.

The possibility of obtaining large blocks of power at the low prices obtaining in many hydro-electric developments has given a great stimulus to electro-chemical and electro-metallurgical processes. Many processes, partly chemical and partly engineering, e.g. the manufacture of aluminium and the production of electrolytic copper, are commercially possible only where electrical energy at a cheap rate is available. On the European continent much electrical energy derived from water-power is also used for the production of artificial fertilisers from

the nitrogen of the air. In view of the rapid depletion of the world's natural nitrate deposits, and the diminution in fertility of most of the great wheat and cotton growing areas, the production of such artificial fertilisers must become a question of world-wide importance. Among other modern developments in electrical engineering are lighting by the incandescent lamp; traction as applied to tramways and suburban main trlys.; wireless telegraphy and telephony; and radar.

The developments in civil engineering have been probably less marked than in any other branch. Methods of construction have been in general improved and rendered more efficient by the extended use of labour-saving machinery; the design of masonry structures and of steel bridges has been put on a more satisfactory footing; and the necessity for road surfaces capable of withstanding the wear and tear of high-speed motor traffic has led to advances in the art of road construction. The introduction of ferro-concrete, with its combination of steel bars embedded in concrete to increase its tensile strength, has given rise to a distinctive type of construction, which for bridges, retaining walls, and large buildings often offers many advantages in cheapness of construction and maintenance over the older type of masonry or steel structure.

The material prosperity of mankind depends on the work of the engineer. Its means of communication, transport, and locomotion, whether by land, water, or air; its energy supplies; its water supplies and drainage, are dependent on his activities. Indeed, civilization in the modern sense and engineering may be said to be synonymous. While the enormous range of the subject renders it imperative for the engineer to specialise in one branch of his profession, the training of the young engineer should be on as broad lines as possible, and the wider his grasp of the outlines of all its branches, the better are his prospects of ultimate success. The professional training should include a three years' course in the engineering school of some university or technical institute. The first two years of this course are common to all branches of engineering, and usually include the study of chemistry, physics, and mathematics, and the elementary study of civil and mechanical engineering construction,

strength of materials, heat engines, hydraulics, mechanics, along with design work in the drawing-office.

The third year is usually devoted to a more advanced treatment of the subjects relating to some special branch of engineering, and this theoretical training should be followed by a course of practical work in the appropriate workshops or engineering office. It is in some respects an advantage for the practical training to be taken, whether wholly or in part, before the university course, while in some universities provision is made for a "sandwich" course, in which the engineering student takes his workshop training during the summer of each year and pursues his theoretical studies during the winter.

**Engineer Officer.** Commissioned officer of the Royal Navy. Engineers were first appointed to warships in 1838, when the Royal Navy was experimenting with steam propulsion. The first naval engineers ranked only as warrant officers, and engineers were not commissioned until 1848. In 1878 the Royal Naval Engineering College was established at Keyham Dockyard, Devonport. Since 1903 engineer officers have been trained as executive officers and are competent to take executive duties and rise to the highest ranks. They enter the service as midshipmen and undergo four years' training, most of their time being spent in the dockyard workshops and fitting-out basins at Keyham. If 70 p.c. of maximum marks are obtained at the final examination, engineer midshipmen go to Portsmouth for six months in the torpedo school; they are then commissioned as sub-lieutenants (engineers). Technical specialists, they are responsible for the efficient running of main and subsidiary machinery in warships and the control of the engineering workshops and repairs on board. An engineer officer is distinguished by wearing stripes of purple cloth between the bands of gold lace denoting his rank.

**Engineers, SOCIETY OF.** British learned society. Established in 1854, it was incorporated in 1910, when it was amalgamated with the Civil and Mechanical Engineers' Society, dating from 1859. It exists to further the interests of the engineering profession as a whole. The society consists of fellows, members, associate members, and associates, and its head offices are situated at 17, Victoria Street, Westminster, S.W.1.

# ENGLAND: ITS TOPOGRAPHY, HISTORY, ETC.

A. D. INNES, Author of *A History of England: and Others*

*A description of England, from the topographical, the geological, and the climatic points of view, is followed by some account of its industries and communications. Then come sections dealing with its government and its history, the latter being taken down to 1707, from which date it is continued under the heading of United Kingdom. In addition, some thousands of articles describe the counties and towns, rivers and mountains of England, deal with the lives of kings and statesmen, with wars, battles, and political and social movements. Government, local and national, is described in detail under Borough; County; Parish; Parliament, etc.*

England, (A. S. Engla land, the land of the Angles), covers the larger and southern part of the island of Great Britain, excepting only that western part of it known as Wales. It is bounded by Scotland on the N. and Wales on part of the W.; elsewhere its borders are the North Sea on the E., the English Channel on the S., and the Atlantic Ocean and the Irish Sea on the W.

The area of England is 50,874 sq. m., being about five-ninths that of Great Britain. It measures 430 m. in extreme length, from the Lizard to Berwick-on-Tweed, and 370 m. in extreme width, from Land's End to Lowestoft. The coast, especially on the W., is broken with numerous openings, making a total length of 1,800 m. The W. coast is high and rocky, bold cliffs and buttresses of hard rock standing out to sea. On it are three large openings—Solway Firth, Morecambe Bay, and the Bristol Channel, as well as the mouths of the Ribble, the Mersey, and the Dee, which, however, is Welsh on one side. The chief headlands are St. Bees Head, Hartland Point, and Land's End.

The S. coast combines the peculiarities of both the E. and W. coasts, the two sections being divided by the Isle of Wight. East of this is a coast-line with a low, clay shore, broken here and there by chalk cliffs; W. of it the coast is high and bold. Several good harbours include Portsmouth Harbour, Southampton Water, Weymouth Bay, Tor Bay, Plymouth Sound, Falmouth Harbour, and Mount's Bay. The chief headlands are the Lizard, Start Point, Portland Bill, St. Alban's Head, Selsey Bill, Beachy Head, Dungeness, and the S. Foreland.

The E. coast is regular in outline, broken only by the estuaries of rivers. In places it is high and rocky, but much of it is low and sandy, and along parts of it the sea is encroaching. The principal river mouths are those of the Tyne, the Tees, and the Humber, the Great Ouse and the Thames. The chief headlands are Flamborough Head, Spurn Head, Lowestoft Ness, the Naze, and the North Foreland. The N. boundary is formed by the

course of the Tweed, the line of the Cheviots, and Kershope Burn, Liddel Water, the Esk, and the Sark, falling into the Solway. This border is a little under 100 m. in length.

There are few important islands off the coast of England. The Isle of Man, mid-way between the Cumberland coast and Northern Ireland, is not strictly part of England, having its own laws and government. Off Northumberland are the Farne Islands, Lindisfarne or Holy Island, and Coquet Island. Foulness Island is off Essex. Off the W. coast are Walney Island, opposite Barrow, and Lundy Island in the Bristol Channel. Off Land's End is a group, the Scilly Islands.

The Isle of Wight is largest of all and ranks as part of Hampshire.

England is divided into 41 counties, including London, which was formed in 1888 out of parts of Middlesex, Surrey, and Kent. Some counties are subdivided for administrative purposes, while in the three ridings Yorkshire has a more historic division. The counties, with their acreage, which includes the sheets of water therein, and their population according to the census of 1931, are shown in the table in page 3070. The number beside each county indicates its relative position as regards size and population.

The census of April 27, 1931, showed the population of England

England. Physical map, showing the main mountain ranges of England and Wales, the principal rivers, and the coastal features

to be 37,794,003; 18,061,643 males and 19,732,360 females. Figures for the previous decennial censuses were: 1921, 35,681,019; 1911, 34,045,290; 1901, 30,813,043. No census was taken during the Second Great War, but on the last day of June each year an estimate of civilian population was made from vital statistics, the figure in 1949 being 41,214,000. The losses of war had therefore been made good by an increase of births. Much allowance has to

From the recently laid-down alluvial deposits of the Wash to the oldest rocks present in Cumberland and Cornwall the geological series is almost complete. England has been gradually built up by successive additions to the older Cumbrian and Cornish lands as the marine deposits of the several geological ages have permanently emerged from below the sea.

The old western lands occur in three portions. The Lake District is the oldest, with Ordovician and

Between the rivers Tweed and Trent the carboniferous rocks form a chain of uplands which makes a definite water-parting between the rivers of the North and the Irish Seas. Flanking the Pennines are the coalmeasures, which lie in pairs. In the N. the Cumberland and Durham and Northumberland coalfields reach the coast; S. of the range the Lancashire and N. Staffordshire coalfields on the W., and the York, Derby, and Nottingham coalfield on the E., lie on the slopes between the watershed and the almost flat plains of Cheshire and the vales of York and Trent.

Farther S. the carboniferous rocks only appear in detached fragments in the midland coalfields between the Trent and the Stratford Avon; in the mountain limestone and the Forest of Dean coalfield on the edge of the Old Red Sandstone of the Wye and Usk.

#### The New Red Sandstone

On the E. margin of the carboniferous rocks, along a line from the mouth of the Tyne to that of the Exe, are detached portions of the Permian system. From Tynemouth to Nottingham both Permian sandstone and magnesium limestone appear in long narrow bands.

Triassic rocks cover a V-shaped area reaching from Middlesbrough to Gloucester, and from Gloucester to the shore of Morecambe Bay. Detached portions fringe the coast of the Lake District, form the valley of the Lower Eden, and extend across the isthmus of the Cornish peninsula. Their best known representative is the New Red Sandstone. Triassic rocks are associated with lowlands, the vale of York, the valley of the Trent, the Cheshire plain, the Fylde of Lancashire, and the lowlands W. of the Severn.

The remaining portion of England comprises rocks which have no representatives on the W. The Lias stretches in an almost unbroken band from Lyme Regis, E. of the Severn and the Stratford Avon, E. of the Trent, and from Goole to the coast near the mouth of the Tees. Fringing the lias along its eastern margin lies the oolitic limestone, which gives rise to a line of residual hills, from the Cotswolds to the N. York moors.

Between the Wash and Dorset a narrow band of Greensand separates the oolite from the chalk which gives rise to a series of hills—the E. Anglian Heights, the Chilterns, the Marlborough, and N. and S. Downs. Within the V-shape of these hills lies the London basin with its young rocks.

be made, in considering the population of various counties, for movement of people during the war.

**GEOLOGY.** The situation of England with reference to France and the continent of Europe is of supreme importance. The E. and S. coasts make an angle with its vertex just where the British seas are narrowest. Through this S.E. corner continental civilization reached England, and through it England maintains its closest ties with modern Europe. The English people, as distinct from the Scots, Welsh, and Irish, comprise diverse elements, and similarly the English land consists of rocks representative of many more geological ages than are encountered elsewhere in the British Isles.

Silurian rocks and large massive or eruptive basalt. The Cornish peninsula and Herefordshire are mainly Old Red Sandstone and Devonian rocks with eruptive granites in Cornwall. Here the rivers have bitten into the rocks and carved the upland into steep-sided, narrow winding valleys. Between rounded smooth-topped ridges and domes lie marshy alluvial flats, where the streams meander across valley bottoms made by more powerful torrents. In the Lake District the ice sheet gave a slightly different character to the land surface, and in the valleys carved by glaciers long narrow lakes walled by steep slopes radiate from a central knot of mountains, the result of former volcanic action.

The N. and S. Downs are relics of a ridge of chalk which was raised as the Wealden uplift to form a continuous ridge from Wiltshire to France. The middle of the ridge has been worn away to form the Wealden plain and expose the Greensand along the inner scarped edge of the chalk, the Wealden clay within the Greensand, and the Hastings Sand within the clay.

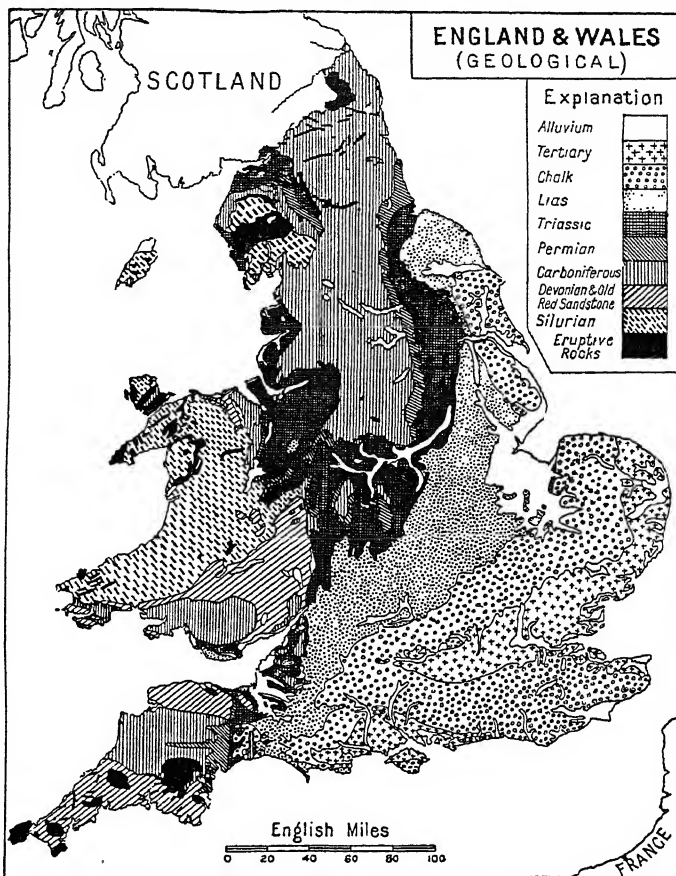

#### Scenic Differences

Each of these geological horizons has been weathered into characteristic land forms. The steep cliff faces of the Millstone Grit in Derbyshire are in striking contrast to the chalk landscape of the downs, marked by rounded contours. The Triassic landscape of the vale of Trent or the Cheshire Plain differs widely from either the oolitic Oxford Clay or the younger London Clay of Herefordshire or Middlesex.

These scenic differences are emphasised by the vegetation typical of each type of rock. The beeches and silver birches of the sandstone of Sherwood Forest differ widely from the woodland which clothes the sides of the narrow Cornish valleys and leaves the uplands bare.

Similarly, the coastal edges of the formations give an infinite variety to the shores of England. The chalk cliffs of Dover and Beachy Head, with their vertical white faces, differ from the sandy cliffs exposed near Bournemouth in the eocene of the Hampshire basin; the miles of iron-bound coast along N. Cornwall from Tintagel southwards are totally different from the sandy lowland shores of the Triassic formation in the Wirral peninsula. In Norfolk and Suffolk the cliffs are noteworthy for their yellow, orange, and reddish hues, their friable texture and tendency to fall away. They are among the newest of England's cliff formations.

**RIVERS AND VALLEYS.** Although the highest ground of England is largely due to those foldings of the earth's crust which produced the Pennine and Wealden uplifts, the residual features are largely the work of rivers. In the N.E., in Northumberland and Durham, the North Sea drainage reaches to a water-parting on the western side of the Pennines; near Cross Fell (2,930 ft.) the Tyne, Wear, and Tees rise close to one another. From Haltwhistle the S. Tyne and the Tyne itself flow due E.; the valley of the S. Tyne leads W. through the Tyne Gap in the Pennines at a lower elevation than 500 ft. to Carlisle. The Coquet, Wansbeck, and Blyth cross the coastal plain of Northumberland, and the Wear

England. Map showing the general geological formation of England and Wales

and Tees for more than half their length find their way along the Durham lowland.

Between Teesmouth and the Wash almost the whole of the drainage is concentrated on the Humber. The large rivers, except the Yorkshire Derwent, rise towards the W. side of the Pennines, the Trent even on the western slopes, and drop through the dales to the level of the Triassic sandstones and marls in the plains of York and Trent. Richmond, Leyburn, Ripley, Sheffield, Stoke-on-Trent, the first large places on the rivers, mark the termination of Pennine valleys. Lower down stream the rivers flow over the sandstones to the main streams of Trent and Ouse which flow parallel and close to the E. edge of the Trias.

The drainage has hollowed the sandstone into a trough with Lias clays on the E. The Yorkshire Derwent is the one exception to the rule that no long rivers cross the Lias to the Triassic plain.

This stream rises close to the coast, flows across the oolitic vale of Pickering between the Cleveland Hills and the Yorkshire wolds in an abnormal course which was determined originally by the presence of sea ice during the ice age in the North Sea. This ice barrier forced the drainage towards the S.W., so that a permanent valley was carved across the Lias clay.

The Wash, Witham, Welland, Nen, and Great Ouse rivers rise on or close to the Lias, and carving out the low residual oolitic hills, drain the trough of clayey land bounded on the E. by the chalk ridge N.E. of the Chilterns. The water gap at the great bend of the Witham is dominated by the city of Lincoln on the oolite ridge above the river.

Probably the Thames once flowed over dry land to join the Rhine and make a great river which flowed N. across the North Sea floor. The Yare, Waveney, Orwell, Stour, Colne, Blackwater,

and Crouch are thus the relics of longer streams which drained from the chalk ridge eastwards to this parent stream. The Kennet rises in the angle where the Chiltern and Downs chalk ridges meet in the Marlborough downs, and flows in a straight course to the Thames at Reading in the general line towards Southend. This is the real lower Thames, with all the left bank tributaries, Colne, Lea, etc., coming down from the chalk across the London clay.

The upper Thames makes a great break through the chalk at the Goring Gap to reach Reading, and the shape of its basin in the Oxford clay plain between the Cotswold oolitic ridge and the Chilterns is due to the general drainage to the S.E. and the sideways drainage in the clay hollow.

#### River System and Market Towns

The Churn, Coln, Leach, Windrush, Evenlode and Cherwell and the Thames itself between Oxford and Reading flow to the S.E.; the Ray and the Thame (vale of Aylesbury), the Ock (White Horse vale), and the Thames above Oxford flow at right angles to this main direction across the clay.

The Wealden rivers rise along a water-parting which roughly follows the line from Hythe to Hindhead. From the northern clay vale the Wey, Mole, Medway and Stour cut through the N. downs. The Arun, Adur, Ouse and Cuckmere cut through the S. downs to the English Channel. The Rother alone is entirely on the Weald, and crosses the Hastings sand.

The Itchen, Test, Avon, Stour and Frome flow from the chalk to the Hampshire basin. The Avon drains Salisbury Plain. All around the coast from the Wash to Poole harbour the rivers reach the sea along a low coast, where the rise and fall of the tides makes a great difference to each estuary.

The river system in general has determined the situation of the market towns. Guildford, Arundel, and Lewes are gap towns on the downs. Oxford, Reading, Chelmsford, and Norwich have each been influenced by the confluence of two streams.

The peninsular rivers of the S.W. are developed from the Exmoor, Dartmoor, and Bodmin moorlands. The Tamar and Torridge, rising in the Ditchen Hills inland from Hartland Point, are exceptions; the valley of the Tamar makes a lowland way across the peninsula. Falmouth Bay is a typical Cornish estuary. The rivers of the oldest rocks in England are tiny streams which flow into large rock-walled estuaries

which are the drowned valleys of the middle or lower courses of the streams; they indicate a period when the streams were larger, longer, and more powerful, and which preceded the inflow of the sea or the sinking of the coast. The Camel estuary is the only large break in the iron-bound coast of N. Cornwall between St. Ives and Hartland Point; here miles of sand at low water attest the fact that the estuary is too large for the tiny stream which drains into it; the river and estuary are not conformable.

The Parret, Brue, Axe, and Bristol Avon belong to an area where many geological formations are crowded together. The Parret is bounded S. by greensand hills, like Leith Hill in the Weald; the Brue and the Axe belong to Sedgemoor, a fen district in miniature with the limestone Mendip Hills to the N. The scenery of the Mendips repeats that of the Peak district, with lead mines, swallow holes, and caverns. The Cheddar Gorge is, however, without parallel in Derbyshire; the cliffs are probably the sides of a great cave of which the roof has fallen. The Bristol Avon rises in the oolitic Cotswolds, crosses the S. portion of the Oxford clay plain, cuts a gorge through the oolite, crosses a lias clay plain, and cuts a second gorge at Clifton through the carboniferous limestone of the Bristol coalfields to the Bristol Channel.

#### The Severn and Thames

The Severn is a Welsh river of which the middle and lower courses are English. It originated probably as one of a series of streams which flowed in a general S.E. direction from the Cambrian mts. The young stream, in all probability the parent stream of the Thames, flowed across a slope where the surface features were of small magnitude. In time the softer clay rocks of the lias and the oolite were worn away, leaving outstanding sandstone and limestone hills and ridges. Struggles were initiated between the streams and the harder rocks; there was a chance that the Cotswold and Chiltern ridges would cut the young stream into three sections. The Goring Gap was cut through the chalk, but no gorge was made in the oolite, and the young stream grew into two rivers—the Thames and the Severn. On the one hand the Severn is parallel to the Cotswolds and the general lines of the Thame, Thames, and Upper Bristol Avon; on the other, it lies on the lias clay, close to the edge of the Trias, and is related in this respect to the lower Trent.

The vales of Evesham and Berkeley resemble the vales of Newark and York. Above the confluence with the Stratford Avon between Tewkesbury and the Coalbrookdale Gorge at Ironbridge, the Severn valley belongs to the Trias: the Worcester plain is like the plain of Burton on the middle Trent. The Teme, Wye, and Usk may be considered as Severn tributaries. In their English sections they cut valleys in the Old Red Sandstone.

#### Lancashire and Cheshire Estuaries

The Triassic plain of S.E. Lancashire and Cheshire is drained by the Mersey and its affluent the Irwell, the Weaver, and the lower Dee. Their outlets to Lancashire Bay, the Mersey and Dee estuaries, are not conformable with the streams themselves. In both rivers the estuaries are being silted up; sandbanks a few feet below the sea continue the Wirral peninsula far to the N., the main channel winding at low water as a narrow stream across the sand-choked Dee estuary. The bottle-neck formation of the Mersey estuary assists the daily scour of the tides, but large dredgers have to be maintained to provide a regular channel for liners. Ribblesdale belongs to the mountain limestone of the Pennines, and connects with Airedale at the Aire Gap.

Lonsdale is a reminder that the Lune is a Pennine stream with a silt-filled estuary. The tiny streams of the Lake District which reach Morecambe Bay are really longer than the map indicates, since they form definite valleys across Morecambe sands and have lower courses which are only obscured at high tide. The Eden rises close to the sources of the Swale and Ure, flows across Permian sandstone to the Triassic Solway Plain; its affluent, the Irthing, completes the Tyne Gap in the Pennines. Like all the Triassic bays, Solway Firth has vast stretches of sand exposed at low tide. The Lake District culminates in Scawfell, but the lake valleys radiate from Helvellyn. Windermere, Conistone Water, Wastwater, Ennerdale Water, Buttermere, Derwent Water, Bassenthwaite, Thirlmere, Ullswater, and Hawes Water are typical lakes of a glaciated area, and fill part of the narrow dales which lead downwards between tree-clad ridges from the central dome where ancient sedimentary rocks are exposed in Skiddaw, and intrusive volcanic rocks raise weathered peaks, as at Scawfell. Walney Island and the coast from Foulney Island to S. Bees Head is Triassic lowland. Windermere, Ambleside and

England. Map indicating the mean actual annual temperature of England and Wales

Keswick are examples of settlements where a route leads from one dale to another.

The shallowness of British seas and the gradual shelving of the English shore are important in reference to the rhythmic pulsations of the tides. In few countries is the tidal effect felt so far up the rivers. In the characteristically English unconformable estuaries the scour of the tides keeps open the regular channels, with the result that there are scores of tidal harbours round the English coasts. No part of England is more than 70 m. from a section of this tide-swept coast.

**CLIMATE AND WEATHER.** Ultimately, the climate depends upon degree of insolation and on currents in the atmosphere between the lower surface inhabited by man and the isothermal layer 5-6 m. up. The lower faces of these currents are disturbed into eddies by the varied configuration of the land surface, but the general movements are steady and continuous. The climate of England is determined within wide limits by the intensity of the sun's rays which it receives; because of its situation England is not tropical like Ceylon, nor arid like Egypt, nor a frozen waste like Spitsbergen.

The limits set to its climate by its latitude are far apart. The precise range of the climate is determined by atmospheric currents, which move in relation to three areas of definite types of atmospheric pressure. To the

S.W. over the Atlantic lies the Azores area of high pressure; to the E. over the mainland, pressure is usually high in winter and low in summer; to the N.W., over the Atlantic, pressure near Iceland is usually low.

The prevalent surface winds are, therefore, those with a westerly direction, which bring oceanic influences to bear. As these winds are usually moisture-laden, rather warm in winter and cool in summer, English seas, rivers, and lakes are seldom frozen, and England has the mildest winter of any part of the world in corresponding latitudes. These results are chiefly due to clouds and consequent rain. England has usually a high percentage of cloud-covered sky, which serves the double purpose of a blanket in winter and of a screen in summer.

In winter, when the earth should cool rapidly and dissipate the warmth stored in summer, the clouds restrict the radiation of heat, condense into relatively warm rain, and in so doing release heat and bring muggy, foggy days. In summer, the clouds screen England from the fierce rays of a sun high in the sky, and supply frequent rains. As more water is evaporated in summer than in winter frequent rainfall means a lowering of the temperature by the absorption of the heat necessary to change the water into gaseous moisture. An English July may therefore be cool and rainy.

The isotherms, which indicate corrected temperatures at sea level, show that in July London is hottest, over 64° F., and the strip of land along the Scottish border is coolest, below 59° F. But in Jan. Land's End is warmest, over 44° F., and the E. coast from Flamborough Head to the Nore is coldest, below 38° F; London is no warmer than Carlisle or Berwick, Liverpool is as warm as Southampton. In summer the isotherms run E.-W. and in winter N.-S.

The actual weather probable at any English town is determined by local conditions of elevation and slope and by general variations from the normal. The prevalent winds usually reach England as depressions following more or less definite tracks from the Atlantic: sometimes the storms are fended away from England because the continental high pressure extends over the S.E. and brings clear skies, cool nights, and a frosty period in winter; at other times the Azores high pressure approaches the S.W., and Cornwall has a succession of bright, sunny days while in the N. the weather is cloudy, cool, and wet.

These general variations affect the entire country, while the surface configuration introduces purely local variations. The annual temperature of England, were it entirely a plain, would lie between 48° F. and 54° F.; the map shows that it actually lies between 38° F.

England. Map showing the annual distribution of rainfall in England and Wales

and 52° F., and that the hills are cooler than the lowlands. Really the S. coast, the London area, and the lowlands of the S.W. are warmest, the Lake District is coldest, and the Vale of York is as cool as the tops of the N. Downs or the Chilterns. The rainfall map shows primarily the effect of elevation; the wettest place in England is in the Lake District, and even minor ridges are wetter than the plains beneath; the tops of the Downs receive more rain than the Weald plain. But rain clouds come from the ocean, so that the W. of England is wetter than the E. Dartmoor and Bodmin Moor are wetter than the Peak, and the 500 ft. level on the Lancashire slope of the Pennines receives 10 ins. more rain a year than the corresponding level on the Yorkshire slope; Holderness is drier than the Wirral.

The actual number of hours of sunshine experienced in England varies considerably: e.g. Cornwall, Essex, and the S. coast receive yearly about 1,700 hours, the E. slopes of the Pennines less than 1,200 hours. But the difference is largely neutralised by the slope of the ground. Although the sun shines almost equally upon both sides of the S. Downs the southern slopes are so tilted that the sun's rays have an increased heating effect, while the northern slopes are tilted away from the sun.

The climate and weather of England have, therefore, a definite character. There are few extremes, there is constant change, and, within a small area or a short period, considerable variety.

**MOVEMENTS OF POPULATION.** Celt, Saxon, Dane, and Norman left their impress upon the English people, and the prosperity of England later attracted Welsh, Scots, and Irish from within the British Isles and strangers from the Continent. British freedom drew many immigrant aliens from Central Europe, particularly the Jews. Consequently, the English people is almost as kaleidoscopic as the English rocks or English weather. The total of nearly 38 millions is unevenly distributed over 51,000 sq. m. England contained two-thirds of the population of the British Isles in 1871 and three-quarters in 1911; the rate of increase per decade has gradually diminished from 134 per thousand, 1861-71, to 105, 1901-1911. In 1801 the population was 8,900,000, and in 1851, 17,900,000.

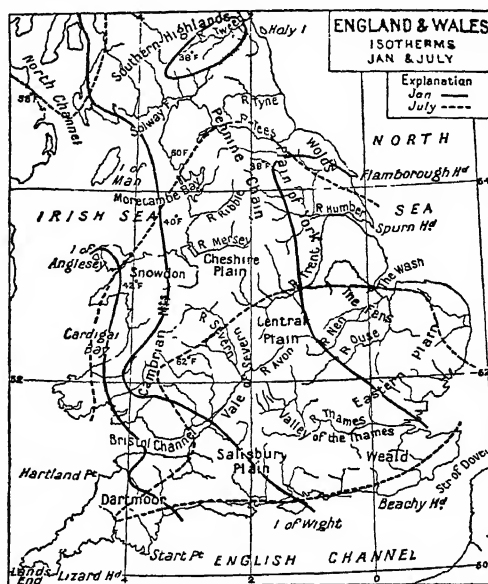

The Pennine, N. Yorkshire and Cornish moors, and the Cumbrian Mts. are uninhabited; in the in-

habited areas there is a continuous gradation towards definite areas of concentration. Roughly, in a belt of country stretching from Weymouth across Salisbury Plain and the Clay Vale to near Peterborough, past Lincoln and Gainsborough to York and the N. half of the plain of the Tees, the population is least dense. E. of this belt there is approximately a steady increase towards the London area. W. of it there are several foci of population. Bristol, the Black Country, the Potteries, the inverted sickle of S.E. Lancashire, and the W. Riding with the continuation to Derby and Nottingham, the Durham district from Darlington to Newcastle—all these are crowded, and the population gradually thins out away from these centres.

#### Varying Areas of Population

A closer examination of details indicates that the areas of dense population such as the London district include nuclei of very dense population grading off to areas of relatively few inhabitants. Consider the area composed of the counties of Cheshire, Derbyshire, Nottingham, and the N. half of Staffordshire. In 1801 more than half the area had fewer people than 128 per sq. m. In the W. half Chester, Nantwich, Northwich, Macclesfield, Stoke, Stockport, and Altrincham were small urban areas with at least 1,920 people per sq. m. In the E., Derby, Nottingham, Newark, Retford, and Chesterfield were similar urban areas. By 1851 the areas of sparse population had grown smaller and the urban areas exceeding 1,920 per sq. m. were more numerous along certain definite lines, from Birkenhead to Stockport along the Mersey, from Stoke N. to Macclesfield, from Derby N. to Chesterfield; the Nottingham nucleus was larger, but those of Chester, Retford, and Newark were unchanged.

By 1901 the areas of sparse population were nearly as large as in 1801; the rural areas were being depopulated. The urban nuclei, already developed in 1851, had be-

England. Isothermic map, in which points recording the same temperature at a given time are joined by lines

come larger except at Newark. New nuclei had grown along the lines already noted, but the greatest change occurred near Nottingham, where a small urban area had expanded to make almost a complete ring something like 5 m. wide. Throughout two-thirds of the area the population was less numerous in 1901 than a century earlier; in parts there had been an almost continuous decline, elsewhere there had been growth until 1841 and subsequent decline. The urban areas already specified had multiplied their numbers by from 4 to 10 times. Near Birkenhead, round Stoke, in a belt of country from Nottingham to Chesterfield, there occurred exceptional growth.

#### General Conclusions

An inquiry into the circumstances attendant upon these changes yielded the following conclusions. The purely farming areas either absolutely declined in numbers or increased by little more than 50 p.c. In the lead-mining districts the population was almost stationary until the mines failed, when it declined absolutely. In the colliery districts the population increased approximately eightfold. In the salt-mining areas of Cheshire the people increased steadily. In the districts where cotton factories were established growth in population was rapid, but the failure of factories established in unsuitable localities during the boom caused a decline. Results may be summarised thus: the industrial development of the area

attracted the people from the farms and also drew to the urban nuclei large numbers from other parts of England. Similar conclusions may be drawn from an investigation of the population of the West Riding.

The above is a general commentary on the period since the industrial revolution. Modifications have occurred in the 20th century, the depression in northern industries having induced a southward trend of the population, although the 1931 census showed in the N. as well as in the S. a strong concentration in huge industrial towns at the expense of smaller urban areas. Decentralisation of industry for safety in war time caused further shifts of population. A list of the largest English towns, with the number of inhabitants in 1931 and an estimate for 1945, is shown in the accompanying table. These fall into three geographical classes: manufacturing towns on or near the coalfields of the N. and Midlands; seaports, harbours, and

seaside resorts; dormitory towns near London. Norwich is the only place exceeding 100,000 inhabitants outside these groups. Other towns may be devoted to a specialised industry, *e.g.* Burton-on-Trent; of historic, ecclesiastical, or educational importance, *e.g.* York, Winchester, Canterbury, Oxford, Cambridge; transport centres, *e.g.* Crewe, Swindon; catering for holiday makers, invalids, and retired folk, *e.g.* Bath, Buxton, Harrogate, Scarborough; or show places like Stratford-on-Avon.

**INDUSTRIES.** Though England grows wheat, oats, and barley, and raises cattle and sheep, these products supply only a fraction of the cereals and meat required by the inhabitants, with the result that England is proportionally the greatest food importing country in the world. The wheat is grown chiefly N. of the Thames, and E. of a line drawn from London to Goole. Oats thrive in the lowlands. Large county yields are in the E. and Cheshire. Barley is grown in dry Norfolk, Suffolk, and Lincoln; the dryness of the harvest improves malting quality. Beet sugar, especially in the E., was introduced comparatively late.

Cattle are most numerous in the W. lowlands, extending from the plains round Morecambe Bay in a wide sweep along the Severn valley into the Cornish peninsula, where the rainfall exceeds 60 ins. annually, and the clays and alluvial flats yield rich meadow grass. The great centres of population have brought into existence small farmers with small herds of milkers on poor grass land. In Cheshire the dairymen supply the cotton towns with milk, and make cheese. Derbyshire and Leicestershire produce Stilton cheese. Cornwall is rich in cattle, the milk being made into butter and clotted cream. In Devon the cattle are likewise reared for their milk but also for the butcher.

As to sheep, the short pasture and dryness of the chalk hills of Kent, Wiltshire, Dorset, Lincolnshire, and the East Riding are specially favourable. The hill slopes of Shropshire, Hereford, Monmouth, Northumberland, and Cumberland support other flocks.

To indicate the effect of climate and locality on the farmer's work, four counties may be compared: Essex, dry and near London; Lincolnshire, equally dry but distant from dense areas of population; Cheshire, wet and near populous S.E. Lancashire; Devon,

wet and with few towns. Essex has an exceptional area under wheat; its minor crops are beans, peas, potatoes; glasshouses supply grapes, tomatoes, etc., to London; there are seed and fruit farms; rose culture is important; the cattle, below average in number, supply milk to London. Lincolnshire has a large acreage under barley, and grows peas, beans, potatoes, and other roots; Lincoln shorthorns are good milkers and Lincoln sheep are exported for breeding. The west has a relative excess of permanent pasture. Cheshire cattle are chiefly dairy cows, its cheese is famous, and it grows potatoes and root crops. The wheat acreage of Devon is remarkably low, while fruit is abundant, sheep are in excess of the average, and cream is celebrated.

The chief English fishing towns are on the E. coast, Grimsby, Yarmouth, and Lowestoft accounting for most of the catch on this coast, which amounts to three-quarters of the English total. Newlyn is the chief fishing centre on the S. coast, and St. Ives and Fleetwood on the W. The main catch in the North Sea is herring, in the Channel, mackerel and pilchard.

#### Coal and Other Minerals

Coal is the chief mineral of England, which in 1914 yielded a fifth of the world's output, employing a million workers. Not only carboniferous rocks composed the coalfields, for those of York, Derby, and Nottingham have an indefinite boundary under the newer rocks to the E. of the carboniferous series; thus coal may be found at greater depths on the E. margins. Iron came from the coalfields, where the ore was found between beds of coal, and in Cleveland and Furness there are large deposits of haematite ore.

Lead-mining, located chiefly in Derbyshire, has been declining for many years. Cornwall produces tin. Zinc in Cumberland, manganese in Cornwall and Devon, and tungsten in Cornwall are minerals of minor importance. The most important non-metallic mineral is salt, found chiefly in the Nantwich district, also in Lancashire, Worcestershire, and Durham.

The most important English manufactures are textiles. Cottons are focused on Manchester; the chief districts are Blackburn, Oldham, Bolton, Stockport, Preston, and Rochdale. Woollens are chiefly made in the West Riding, with Bradford as a technical and Leeds as a marketing centre, the other

chief districts being Huddersfield and Halifax. The manufacture of woollens extends W. to Rochdale, that of cottons E. to Halifax and Bradford. Silk goods are made over a wider area and on a smaller scale, the main centres being Bradford, Stockport, Halifax Stoke. Birmingham, and London. Leicester, Nottingham, and Derby make lace and both cotton and woollen hosiery. The distribution of the textile industry is largely controlled by the S. Pennine coal-fields.

Because England took the lead in manufacturing on a large scale, her manufactures of iron and steel were for a long time more important in rly. construction and shipbuilding than those of any other country. Smelting operations are usually carried out near the mines, especially in Cleveland and the Black Country. Pig iron is made to the extent of about 7,000,000 tons annually: forge and foundry, Bessemer, haematite, and basic; for these purposes iron ore is imported chiefly to Middlesbrough to supplement local supplies. Steel is made chiefly by the open hearth process.

Sheffield steel and Birmingham hardware are world famous.

The chief shipbuilding district in normal times has been between the Tees and the Tyne. Shale and crude oil are produced in the North. Birmingham, Wolverhampton, and Coventry have been versatile in their products. Other manufactures are specifically localised. The Potteries on the N. Staffordshire coalfield use local clay and coal for making crockery and earthenware. Northampton and Leicester are centres for boot and shoe manufacture. Chemicals, alkali, and soaps are made chiefly near the Mersey. Steam-driven flour mills are located at the wheat-importing ports, London, Hull, etc. Burton beer, Leeds ready-made clothing, Bristol tobacco, Reading biscuits, may be named.

COMMUNICATIONS. The English railways radiate from London. In 1923 four great groups were formed, the object being the economy resulting from joint management and administration, and elimination of losses due to competition. The groups were as follows: (1)

Southern Railway; (2) Great Western; (3) London, Midland, and Scottish; (4) London and North Eastern. These four groups formed the basis of the five English regions of British Railways that came into being after the nationalisation of the railways in 1948. The five regions are: (1) Southern region; (2) Western region; (3) London Midland region; (4) Eastern region; (5) North Eastern region. From the 1920s there was extensive electrification of suburban and S.R. lines.

English barge canals (see plate facing p. 1704) have been neglected through rly. competition. The only ship canal of importance has made Manchester the fourth port of the country and brought ocean steamers some 30 m. inland, almost to the doors of the cotton factories.

The main roads radiate from London to all points of the compass; e.g. A 1 (ministry of Transport classification) to Edinburgh; A 2 to Dover; A 3 to Portsmouth; A 4 to Bath; A 5 to Holyhead; A 6 to Carlisle. Two great routes do not touch London; from Sheffield through Birmingham, Gloucester, Bristol, and Exeter to Land's End, and from Chester through Shrewsbury and Hereford to Gloucester.

Regular internal air services operate between England and Scotland, Wales, the Isle of Man, N. Ireland, the Channel Islands, and the Scilly Isles.

COMMERCE. England is still among the greatest markets in the world. The need to supply the population has brought about cold storage for mutton and beef, perishable fruits, etc., and has caused great developments in canning, drying, or preserving foodstuffs. Wheat is harvested, and fruits are picked somewhere in the world every week, and consequently the world can send to England a continuous stream of foodstuffs; the products of the S. hemisphere, wheat, mutton, beef, butter, fruits, etc., are at their best when the supplies of the N. begin to fail. In addition to these supplements to home supplies, tea, coffee, rice, etc., are imported. But England is a market for raw materials as well as foodstuffs. She buys the specialties of other lands, and partly pays for these imports by the services of merchant shipping, of the technical experts lent to other lands, and by the export of coal and manufactures.

London and Liverpool rank among the greatest seaports of the world. They are approximately

England. Map showing the principal railway routes of England and Wales

equal in total value of trade in normal times, but London has an excess of imports, while at Liverpool exports and imports balance. Hull, Manchester, Southampton, Newcastle-upon-Tyne, Grimsby, Goole, Bristol, Harwich, Newhaven, Dover, and Folkestone are other ports.

**CONSTITUTION AND GOVERNMENT.** The constitution of England has been extended to apply to the United Kingdom since 1707 and with varying degrees of alteration to Northern Ireland, Eire, the dominions and colonial possessions. It is democratic, but that is probably the last way in which it would be described by a casual observer paying more attention to forms than realities. That framework of government which in the Middle Ages gave it an oligarchical tinge and under the Tudors made it almost a dictatorship still in theory remains unchanged. During all these periods England has had a legislature consisting of the sovereign and two houses of parliament, and the sovereign has been the source of executive power. Great changes there have been; usually they have been gradual, but even when more violent, as in the revolution of 1688-89, the framework has been untouched except for the break during the interregnum, whose very name indicates impermanence. The constitution has never been completely recast, for England has had no true revolutions.

#### **Influence of Custom and Convention**

Many important changes are due not to the alterations in the law but to the growth of customs and conventions. There is no law which says that parliament must meet once a year; nor to prevent the crown from refusing its assent to any bill passed by the two houses of parliament; yet parliament does meet every year and no sovereign has refused assent to a bill since 1707. Most royal powers are actually exercised in the name of the sovereign by ministers answerable to the house of commons. Conventions do often depend indirectly on some law. If parliament did not meet every year it would be impossible to carry on the work of government, as no money would be available since taxation must be imposed each year by Act of Parliament. No army could be maintained, for the Army Act authorising its maintenance has to be passed each year.

The English constitution is flexible, not rigid like that of the United States, contained in

one formal document capable of alteration only by special procedure. There are Acts of Parliament and constitutional documents of great importance—Magna Carta, 1215; Petition of Rights 1628; Bill of Rights, 1689; Act of Settlement, 1701; but these are on no different footing from other Acts. It would be open to parliament in one day to pass an act repealing every one of them, using procedure no different from that employed to repeal any other Act.

#### **Relation of Executive and Legislature**

Another characteristic is that the executive is responsible to the legislature. This means in practice today that the government is formed from members of the political party which commands a majority in the house of commons, and can hold office only so long as it is supported by that house. In the U.S.A. the executive is not responsible to the legislature. The president is head of the executive and is elected for four years. It happened as a result of the congressional elections in 1946 that a congress with a strong Republican majority was returned although President Truman was a Democrat. A similar situation arising after the First Great War, when a Democrat president, Wilson, was in office with a Republican congress, was largely responsible for the American refusal to enter the League of Nations. Under the English constitution it is impossible for such a situation to arise.

A third English characteristic is the Rule of Law. The essence of this is the absence of any arbitrary power, and it is the main basis of English freedom. The Rule of Law ensures that the executive has no arbitrary power over a citizen, for he can be punished for anything he has done only if an impartial court sitting in public decides that he has infringed the law. It is vital to the operation of this Rule of Law that the judicature should be independent of the executive. A judge can therefore be removed from office by the crown only on a joint address of both houses of parliament; and his salary is paid out of the Consolidated Fund, i.e. is fixed by Act of Parliament and paid automatically each year, not coming before parliament annually as do the salaries of most public officials. Thus a judge who has to decide a case in which the executive is concerned need not fear to decide against the executive.

Montesquieu from a study of the English constitution derived the

doctrine that its effectiveness was due to the separation of powers, i.e. to the legislative, judicial, and executive powers being independent of one another. This doctrine had important results in the constitution of the U.S.A. which was based on it; but has never been strictly applicable to the English constitution. Legislature, executive, and judiciary are not completely separate. In particular, the executive has always exercised some legislative and judicial powers. These powers growing in recent years, their wide extent has been declared dangerous to freedom by many eminent lawyers, e.g. Lord Chief Justice Hewart in *The New Despotism*. In spite of this opposition, today vast numbers of laws are made not by parliament but by some government department under powers delegated to it, and many decisions as to rights of individuals are made not by the courts but by some official of a government department. A good example is afforded by the National Insurance (Industrial Injuries) Act, 1946, under which questions whether an employed person has been injured by some accident "arising out of and in the course of his employment" are to be decided in private by an official of the ministry of National Insurance, and not, as hitherto, in public by a court under the Workmen's Compensation Acts. Other examples of the exercise of legislative powers by the executive were afforded by thousands of regulations made during the Second Great War.

#### **Government by the Commons**

The legislature consists of king, lords, and commons; but in practice power lies with the commons and inside that house the party which enjoys a majority and forms the government can usually bring about the passing of such legislation as it pleases. The checks on the power of the government are practical rather than legal. Ministers must have some regard to public opinion as voiced by the press and representative bodies like chambers of commerce. To ignore it would lead to breaches within the party, a defeat of the government, and the holding of a general election. A prominent feature both in the house of commons and in the constituencies is the party system under which members are elected not for their individual qualities or policies but because they belong to one or other of the political parties. Likewise in the house members are expected

to vote in support of the party to which they belong.

Since 1911 the supremacy of the house of commons has been put on a legal basis, for the Parliament Act of that year provided that any bill (except a money bill or a bill extending the duration of parliament beyond five years) if passed by the commons in three successive sessions would become law on receiving the royal assent even though it was rejected by the lords. Money bills, *i.e.* bills relating to taxation, on receiving the royal assent become law if passed once by the commons, though rejected by the lords.

The executive consists of ministers of the crown with the prime minister at their head. The most important ministers form the cabinet, all normally of one political party, unless a coalition of parties is formed in time of crisis. In practice the cabinet decides what legislation shall be proposed in the house of commons. Occasionally Acts are passed which have been introduced by private members, *e.g.* A. P. Herbert's Matrimonial Causes Act, 1937. Each department of state is under the charge of a minister, although occasionally ministers whose presence and advice are desired are appointed without portfolio. Ministers must defend their departments in parliament. The departments are manned by permanent civil servants.

#### **Functions of the House of Lords**

The judiciary in civil matters consists of the house of lords, the supreme court of judicature, and county courts. The house of lords hears appeals from the court of appeal and when acting in this capacity does not consist of all the peers who take part in its proceedings when it is acting as part of the legislature. Legally every peer is entitled to attend, but for 100 years there has been a convention that on the hearing of an appeal no peer shall take part except the lord chancellor, the lords of appeal in ordinary, who are judges appointed for life, and peers who hold or have held high judicial office. The supreme court of judicature consists of the court of appeal and the high court of justice. The court of appeal hears appeals from county courts and from the three divisions of the high court: king's bench division, chancery division, and probate, divorce, and admiralty division. Judges of the king's bench division go round the country on circuit hearing civil and criminal cases.

Justice is administered locally in county courts which hear cases involving less than a certain amount of money.

Criminal cases are heard by benches of several lay justices in petty sessions or by one magistrate who is a lawyer. More serious cases are sent for trial before a recorder in quarter sessions or before judges of the king's bench division at assizes. In London the central criminal court (Old Bailey) takes the place of an assize court. An appeal lies from petty sessions to quarter sessions or on a point of law to the king's bench division; from quarter sessions, assizes, and the Old Bailey to the court of criminal appeal; thence in special cases to the house of lords.

Before the Statute of Westminster, 1931, no dominion legislation was valid if it was repugnant to the rules of English common law or any English statute. This continued to apply to colonial legislation.

**LOCAL GOVERNMENT.** Under the supreme control of parliament, the people of England enjoy a large measure of local government. Each unit is a democracy working through the representative system. The men and women of county, borough, district, and parish elect certain men and women to form a council which manages such matters as parliament has entrusted to it. In many, but not all, of these councils there is an element—the aldermen—not directly elected, but chosen by the elected councillors.

The main division, as far as local government areas are concerned, is the venerable one between county and borough, although the demarcation is by no means complete. The forty older counties (London is an exceptional case) of England have had some sort of local government for a thousand years, but the existing system dates from the Local Government Act of 1888. The officials who until that time governed the counties—lord-lieutenant, high sheriff, and magistrates in quarter sessions—retain their positions, but their powers passed almost entirely to elected bodies called county councils.

These councils set up in 1888 do not correspond altogether to the counties as they existed before. The three historic divisions of Yorkshire became the East, North, and West Ridings; Lincolnshire was divided into Holland, Kesteven, and Lindsey; Suffolk and Sussex each into East and West; from Cambridgeshire the Isle of

Ely, from Northamptonshire the Soke of Peterborough, from Hampshire the Isle of Wight, were separated; a new county of London was created from parts of Surrey, Middlesex, and Kent; each new division with its council. The councils hold elections every third year, and their powers over education, police, public health, and other matters are laid down in the Acts of 1888 and following years. Towards expenses they receive large sums from the government, but the balance they raise by a rate on all property within the county.

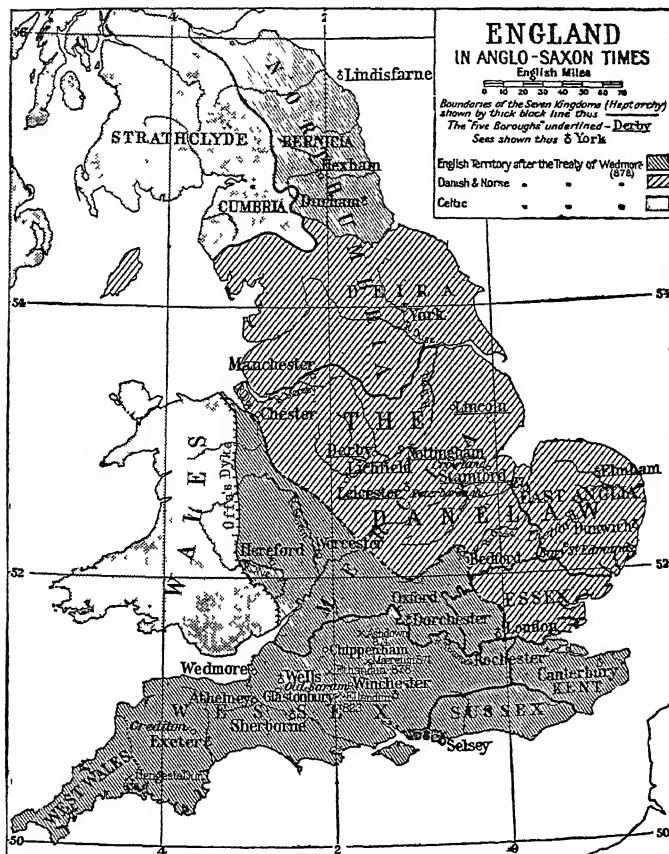

The Act of 1888 affected also the boroughs. It created county boroughs, placing them entirely outside the authority of the county councils, and thus established a system by which every place is in either county proper or county borough, and consequently every voter is represented in one or other council.

Excluding the county boroughs, every part of England is either a borough, an urban district, or a rural district; it is also part of an administrative county and is represented in its council.

#### **What Constitutes a Borough**

The borough is a place which has received a charter of incorporation. Its local government is regulated by the Municipal Corporation Act of 1835 and an amending Act of 1882. It is governed by a mayor and council consisting of aldermen and councillors. The councillors are elected for three years, one-third of them retiring every year, and they choose the aldermen, who form one-third of their number. A special class is formed by 28 into which the county of London is divided. They are subordinate to the London County Council; their powers are different from those of ordinary boroughs; although of considerable size, they are not county boroughs.

The country outside London and outside the provincial boroughs is divided into urban and rural districts, called into existence by an Act of 1894. Urban districts are the thickly populated areas which have not yet become boroughs; rural districts are the country areas. The division is not absolutely rigid, and some populous areas remain rural districts. Each is governed by a council, elected for three years. The head is called chairman, not mayor, and there are no aldermen. These councils work in general under the supervision of the county council.

England. Map of the country under the Anglo-Saxons, showing the divisions of the heptarchy and the territories occupied by the various peoples

**HISTORY.** The departure of the Roman legions in A.D. 407 left Britain without any controlling government, but the old system of local principalities soon revived. The N. however, was open to attack by the Picts and Scots, the W. coast to invasions from Ireland, and the E. to raiders from the European coast. About the middle of the 5th century, Jutes from Denmark made a settlement in Kent which became permanent. During the next hundred years, Angles and Saxons sent fresh hordes which established themselves on the E. and S. coasts, pushing inland till they had mastered the country E. of a line running roughly from Dunbar to Portsmouth.

Between 560 and 613 the newcomers overran the midlands, pushing the Britons further to the W., and thrust wedges up to the sea both on the N. and on the S. of Wales. In 597 Christianity was introduced into Kent. Thence it spread N., where through the greater part of the 7th century Northumbria was the most power-

ful of the English states. In the 8th century the supremacy passed to Mercia, and in the 9th to Wessex.

The second half of the century saw a desperate struggle between the English and a new host of invaders, the Danes, who established their mastery over half the island, but were forced back by Alfred the Great. In the 10th century Edward the Elder and his sons subjugated the Danes, and the kings of Wessex became kings of England.

#### The Battle of Hastings

But the subjugation of the Celts on the Cumbrian hills and the Devon moors was slow and incomplete; while in Wales they successfully preserved their independence. In the 11th century Sweyn, king of Denmark, and his son Canute established a brief Danish dynasty; but on the death of the last of Canute's sons, Edward the Confessor was recalled to the throne of England. When he died in Jan., 1066, the English elected Harold, Godwin's son, as king, but the crown was claimed by William, duke of Normandy, who shattered Harold's

army at Hastings, and was crowned in London on Christmas Day, 1066.

During the next six years risings in the N. and W. compelled William to subdue the whole country by merciless force, and provided him with an excuse for confiscating much of the land and distributing it among his Norman followers, though a substantial number of small estates remained in English hands. Theoretically, the Norman king reigned as the legitimate successor of the Wessex kings, by the same laws, legislating with assent of the *Witan*, the assembly of magnates, occasionally expanded into the common assembly of such freeholders as might choose to attend. Actually the conquest effected a revolution, because all the magnates and half the barons or lesser landholders were now Norman instead of English; the law was interpreted by them in their own interests and they reduced many of their own tenants to serfdom or villeinage.

#### Rule of the Normans

William and his two sons, William Rufus and Henry I, were powerful monarchs who utterly crushed the attempts of the new baronage to ignore or defy the authority of the crown. They called to their support the English population, who were infinitely more hostile to the local Norman tyrants than to the crown, though William II was himself a tyrant. After a reign of 35 years, Henry was succeeded by his nephew Stephen, whose claim to the crown was disputed by Henry's daughter, Matilda or Maud. The reign was a long horror of anarchy; the strife for the crown wrought less havoc than the private wars waged against each other by the barons, who pillaged, robbed, and murdered on all sides. The evil days were brought to an end on the death of Stephen in 1154 by the accession of Henry II, grandson of Henry I, the first Plantagenet.

Henry, already by inheritance or by marriage in possession of half France, did great work in the reorganization of the government of England. The baronage on the whole cooperated loyally with the king in the work. Revenues were collected, and the higher courts of justice were conducted by the king's officers, removable at his pleasure; the practical freedom of appeal to the royal courts against local injustice was greatly extended. The old system by which the king's officers could call up the freemen of the shire in arms was revived, counterbalancing the feudal right of every baron to call upon his own tenants for military service, while incidentally, through the practice of

obtaining the formal approval of the Great Council for the measures upon which the king had decided, the idea developed that the Council had a right to be consulted. In the course of the reign a Norman baronage was planted in Ireland, and, through the formal homage of the Irish chiefs, the island was annexed to the English crown.

Henry's elder son, Richard I, left the governance of the kingdom to justiciars, while he himself was engaged on crusade or in his French dominions. Public spirit and respect for law developed, so that in the reign of Richard's brother, John, who repeatedly overrode the law for his own ends, the barons combined to wring from him Magna Carta. Incidentally, also, John's reign brought about the severance of Normandy and most of the Plantagenet possessions in France from the English crown, making the baronage of England an English baronage with exclusively English interests.

In spite of Magna Carta, John's son, Henry III, in the course of a reign of 56 years, persistently attempted arbitrary and illegal methods of government, choosing for his ministers his own or his wife's foreign kinsmen in place of the English nobles, who regarded such offices as due to themselves of right. At length the baronial party combined under the leadership of Simon de Montfort, in effect to transfer the supreme control from the hands of the king to baronial committees. Faction among the barons led to the fall of Montfort in 1265.

#### Henry III and Parliament

But he had championed two great principles—first, that the sanctity of the law was to be maintained as sternly on behalf of the commons as on behalf of the barons; and, secondly, that the government should rest upon the assent of the realm expressed through the common council of the realm, which was now acquiring the name of Parliament. The practice of summoning thereto elected representatives of the freeholders had been developing all through the century; Montfort in 1265 established the principle of calling also representatives elected by the boroughs. Montfort himself failed, but his cause had triumphed. Acting as champion of the law, he, like Cromwell four centuries after him, found himself compelled to ride roughshod over the law, to adopt unconstitutional methods of asserting constitutional principles. His mantle fell upon the man who had overthrown him, who, as Edward I, made the law supreme.

The reign of Edward I is a crucial epoch in the history of England. In it the English nation, finally consolidated and unified, realized that the common interests of all classes were of more importance to each than the antagonistic interests of individual classes and groups; that the law which should be directed to the good of all should be uniform and fixed. It was the great era of definition, regulation, systematisation. It declared, though not finally, the powers of the crown for raising revenue, the jurisdictions of the baronage, the rights of the national assembly to consultation. It established the law of inheritance, and the subjection of the clergy to the civil law. Above all, it defined for 500 years the constitution of the national assembly itself; this being in the Model Parliament of 1295.

#### Yeomen and Serfs

But while Edward succeeded in unifying England and shaping the structure of the constitution upon foundations which had already been laid, he was not equally successful in accomplishing his desire of extending the unification to the whole island. Hard fought campaigns in Wales brought her into the English system; the attempt to absorb Scotland upon pretexts of feudal law forced her into temporary and incomplete subjection tempered by persistent insurrection, and finally issued in complete failure during the reign of his son and successor, Edward II.

During the 13th century England had become definitely the Merrie England of the ballads. The old hostility of Norman and Englishman had disappeared. The rural population had fallen into the two divisions of those who had succeeded in preserving their legal freedom, the yeomanry, and those who had been thrust into serfdom or villeinage which bound them to the soil on which they were born.

But already the practice of commuting services for payment, and correspondingly of hiring service for wages was becoming widespread; the lot even of the villein was not generally a very hard one. The larger towns were flourishing commercial centres, although being still to a great extent agricultural communities which had purchased rights of self-government and immunity from the jurisdiction of overlords from the king. These rights were conveyed to them by charter. There was already an extensive foreign trade; cloths, wines, and many other European products being imported, while the leading English exports were

wool and hides, and rural products of all kinds.

An incompetent king, Edward II, succeeded Edward I. There was a recrudescence of the struggle between the crown and nobles, who looked upon themselves as the champions of constitutionalism, but were in fact endeavouring to concentrate political power in the hands of a narrow oligarchy. The civil strife, whether latent or active, caused that complete neglect of the Scottish question which enabled Robert Bruce gradually to clear Scotland of the English garrison, and to recover an unqualified independence by inflicting upon the English the decisive defeat of Bannockburn in 1314.

In 1327 Edward II was deposed and murdered by his French wife, Isabella, and her paramour, Roger Mortimer, while the crown was set on the head of Edward III. Three years later the king, then eighteen years of age, effected a *coup d'état* which ended the intolerable government of the regency, and executed Mortimer. All this time Plantagenets had retained possession in France of their hereditary fiefs of Guienne and Gascony, which successive French kings on various pretexts had sought to filch from them. This process was continued by Philip VI. On his accession, a fairly tenable claim to France had been put forward on behalf of Edward of England through his mother, the sister of the last king of France; but France had decided in favour of the Valois succession, and of the principle that there was no right of inheritance to the French crown by or through a female.

#### The Hundred Years' War

The strife over Guienne and Gascony was a standing cause of quarrel; the claim to the French throne provided another pretext; while a serious subject of contention was the attempt to restrict the valuable trade between England and Flanders which was a fief of the French crown. On account of this the Flemings were ready to take part with Edward if he assumed the character of their lawful suzerain by asserting his claim to the French crown, and on this combination of pretexts the Hundred Years' War between France and England was embarked upon in 1337.

The English longbow and the cloth-yard shaft had first been brought into effective play by Edward I in his Scottish wars. The Scots and Flemings had recently proved the power of

spearman to defy the shock of the charge of mailed cavalry. The two principles were combined by Edward III and his son, the Black Prince. The English archery and dismounted men-at-arms shattered superior forces at the battles of Crécy (1346) and Poitiers (1356). King Edward captured Calais in 1347, to remain as a gateway to France for 200 years. In 1360 he forced on the French the treaty of Brétigny, which conceded to him a quarter of France in full sovereignty.

Twelve years later all that had been won was practically lost; England retained only a precarious hold upon a part of Guienne and Gascony, as well as Calais. The war was enormously costly, and its costliness developed the power of the Parliament, which was now strong enough to forbid the imposition of taxes, other than those formally sanctioned in the reign of Edward I, except by its own vote. The power of the purse passed definitely into the hands of Parliament, and with it a certain limited control of policy; the royal revenues were insufficient, at least for war programmes, unless supplemented by the land and property taxes, known as tenths and fifteenths, and afterwards as subsidies, which the lords and commons voted.

#### The Black Death

The general prosperity was checked by the tremendous visitation of the Black Death in 1348. A third of the rural population is said to have perished; for lack of labour the harvest was left to rot and the fields were left untilled, while famine followed upon the plague. The landholders sought to revive all their old powers of enforcing service; the peasantry refused to work except at very high wages, and the government stepped in with the Statute of Labourers, vainly attempting to fix a standard wage. A class animosity was born, quite different from the bygone hostility between the English occupants of the soil and their Norman conquerors. This bore fruit in the peasant revolt of 1381. The revolt was crushed, but was not followed by any enactments for the removal of grievances; the system of villeinage, forced agricultural services, and restrictions upon rural wages remained.

Edward III in the pursuit of revenue had grasped the advantages of encouraging and organizing trade under state supervision. The export of staple goods, wool, hides, etc., was restricted to the Company of the Merchants of the

Staple, trading only in authorised localities, known as the staple towns; the import of manufactured goods was mainly in the hands of foreign trading societies, notably the German Hanse; both groups paid for their privileges and enjoyed powers of regulating the traffic. But at the same time the process of manufacture in England itself advanced greatly, and English cloth goods began to compete in foreign markets as well as in England. Although a gloomy picture of rural life is presented in Langland's *Vision of Piers Plowman*, the pages of Geoffrey Chaucer convey an altogether convincing impression of an England materially prosperous, genial, and light-hearted, and full of a robust kindness.

#### Rule of the Lancastrians

Richard II (1377-99) found himself much in the hands of a faction of the nobility, who, however, could no longer usurp the functions now acknowledged to lie in Parliament. Soon after coming of age, he succeeded in recovering the royal authority, but though he ruled well for several years, he was unhappily nursing vindictive schemes and plans of arbitrary rule. He turned suddenly upon the nobles who had once held him in restraint, put some of them to death, banished others, and imagined himself undisputed master of the kingdom. But in 1399 his banished cousin, Henry of Lancaster, returned to England. The discontented nobles rallied to Henry's standard, Richard was deserted and brought a prisoner to London, a parliament was called, Richard was compelled to abdicate, and the parliament declared Henry king of England by lawful descent.

With Henry IV began the rule of the Lancastrian branch of the house of Plantagenet. Raised to the throne of the cousin who was done to death soon afterwards, while yet another cousin, the child Edmund Mortimer, had a better claim than his own to the succession as descending from an elder son of Edward III, Henry knew that he ruled by a parliamentary title. Parliament knew it, too, and the result was that the Lancastrian kings were very much at the mercy of their parliaments. Also, as clerical influences had been vigorously applied on Henry's behalf, the house of Lancaster was compelled to conciliate the clergy. Hence Henry was led to a rigorous suppression of the Lollards. The teaching of Wycliffe, about the end of the reign of Edward III, had attained considerable popularity during the reign of Richard II in a

country where the anti-clerical sentiment was always strong, until it began to be applied as a sort of communistic propaganda; but burning at the stake as the punishment for the unrepentant heretics first became the law of the land in the reign of Henry IV.

That monarch's uneasy rule of fourteen years was followed by the brilliant reign of his son Henry V. In the anarchy which had overtaken the French kingdom, Henry found occasion for a preposterous revival of the claim of Edward III to the French crown. In 1415 he invaded France, captured Harfleur, and at the head of no more than 8,000 men won the victory of Agincourt. Three years later he returned to France and set about a systematic and organized conquest. The factions of French politics brought over to his side the powerful duke of Burgundy and the French queen, when all Normandy was already in his possession. The king of France was compelled to acknowledge Henry as his heir, while the dauphin Charles and the greater part of France remained defiant. Inch by inch Henry made himself master of N. France, but in 1422 he died, leaving the English crown and the French succession to his infant son, Henry VI, and the government of the country to a council of regency.

#### Loss of Burgundy and Guienne

The resources of England were not equal to a conquest of France. In spite of the abilities of Henry's brother, John, duke of Bedford, the subjugation proceeded slowly, and was stopped altogether by the extraordinary interposition of Joan of Arc. The death of Bedford himself in 1435 was fatal to English ambitions; the defection of Burgundy was still more decisive, and from that time the record of the French war was one of almost continuous defeat; until in 1453 even Guienne was lost, and Calais was the only foothold left to the English in France.

The usurpation of Henry IV and the aggression of Henry V brought their Nemesis. Popular disgust was kindled against the faction who exercised control over the weak, pious Henry VI as being responsible for the disastrous mismanagement of the war and the feeble government at home. The opposition was led by Richard of York, representative of a branch of the descendants of Edward III senior to the house of Lancaster. Richard claimed to be the effective head of the government. The rebellion of Jack Cade in 1450 was not, as is commonly supposed, an

agrarian rising like that of Wat Tyler, but was, primarily at least, a popular protest against the unpopular government. The strife of the factions in high places issued in the War of the Roses.

From 1455 to 1460 war and truce between the parties alternated. It was not until 1460 that Richard startled his own supporters by asserting his own claim to the crown, a claim modified into demand for recognition as the heir, although King Henry had a young son. Richard was killed at the battle of Wakefield, but his son Edward, supported by Warwick, proclaimed himself king, shattered the Lancastrian army at Towton in 1461, and maintained himself on the throne till his death in 1483.

During the first ten years of his reign there were repeated Lancastrian insurrections; the defection of Warwick actually drove Edward IV in flight from the country in 1470; but, returning in the next year, he crushed Warwick and the Lancastrians at the battles of Barnet and Tewkesbury, and for the rest of his reign ruled without fear of any rivals.

On Edward's death his brother, Richard of Gloucester, after an interval of a few weeks usurped the throne of his young nephew Edward V, who was shortly afterwards murdered in the Tower with his brother. The usurper instituted a reign of terror so intolerable that after two years Henry Tudor, earl of Richmond, a descendant of John of Gaunt, though by an illegitimate line, and the acknowledged head of the Lancastrian party, was able to return to England from the exile into which he had retired, to slay Richard III at the battle of Bosworth, and to claim the crown, a title acknowledged by the parliament which he summoned.

#### The Reign of Henry VII

During 25 years the power of the sword had decided who was to be king in England; parliaments had been summoned, but were attended only by partisans of the dominant faction. Each side had attained of treason all the leaders on the other side, put them to death when it could lay hands on them, and redistributed their estates. The old families were almost blotted out, and the new generation of nobles bore names which had hardly been heard of fifty years before. It was the business of Henry VII (1485-1509) to restore peaceful and orderly government, commercial prosperity, and reforms, at least of law. The claws of rebellion were clipped and the royal treasury was simultaneously filled by the systematic process of fines

and confiscations, drastically applied wherever an excuse could be found. Parliament was habitually summoned and treated as the king's responsible partner in all his acts.

Foreign policy was directed to the development of commerce and the acquisition of indemnities for campaigns on which nothing had been spent; commerce itself, on the other hand, was applied as a weapon for making the rulers of France and Burgundy compliant. The king ruled always by forms of law; taxation and legislation were the province of parliament, though a skilful king rarely failed to procure from parliament the powers or the money which he required. Rebellions raised on behalf of pretended members of the house of York, Lambert Simnel and Perkin Warbeck, were suppressed. Henry's marriage to Elizabeth of York put the title of his son to the succession beyond question; the marriage of his daughter Margaret to James IV, king of Scotland, in 1503, placed a Stuart on the English throne as the legitimate monarch a hundred years later. When Henry died in 1509 the house of Tudor was firmly established on the English throne, and the crown with a full treasury enjoyed an almost unprecedented power.

#### The Discovery of America

The reign of Henry VII fell upon that period of transition when the medieval world was passing into the modern. In 1477 the first printing press had been set up in England. The intellectual movement long active in Italy reached England and awakened a new spirit of criticism. Columbus discovered the West Indies, the Cabots from Bristol reached Labrador, the Portuguese sailed across the Indian Ocean to India. Europe was emerging into a new state system. With Henry VII dawns the conception of international relations as being concerned with the preservation of a balance of power among the great states. In the reign of Henry VIII (1509-47) Cardinal Wolsey stands out as the diplomatist who made it his aim to hold the balance between the king of France and the king of Spain, who was at the same time lord of the Netherlands and German emperor—Charles V.

But Henry's international activities were merely an episode. The great feature of the reign was the ecclesiastical revolution which fixed the grip of the state irresistibly upon the church, annexing the greater part of its wealth, and repudiated the authority of the papacy. The instrument of

the revolution, the artificer who designed its methods, was Thomas Cromwell, who, after Wolsey's fall in 1529, won Henry's confidence and retained it till 1540, when he had completed the work, not only of subordinating the church to the crown, but of obtaining for the crown by strictly legal parliamentary process such a latitude of power as it had never before possessed.

#### Edward VI and Mary

When Henry initiated the ecclesiastical revolution with the primary object of getting rid of his wife in order to marry another, he took the nation into partnership and secured parliamentary sanction for everything he did. He, however, procured from it first a weapon for silencing all external opposition in the Treasons Act of 1534, and then a virtually absolute authority for himself, though not for his successors, by the Royal Proclamations Act of 1539. Henry left one young son, whose legitimacy was indisputable, and two older daughters by mothers whose marriages with him had both been pronounced invalid, though before his death it had been formally laid down that the right of succession remained to both children.

While Edward VI was king (1547-53) the government was in the hands of a council controlled first by Edward's uncle, the protector Somerset, and then by John Dudley, earl of Warwick, best known as duke of Northumberland.

Henry's extravagance had depleted the treasury; he had suppressed the monasteries, the only institutions in the country which were officially concerned with the relief of poverty. For more than half a century the peasantry had been ousted from the land, and distress and suffering were widespread.

Both Somerset and Northumberland, from conviction or from policy, actively fostered the religious reformation, and carried out the protestantising of the Church with gross and unseemly violence, though without extreme persecution. The accession, however, of Mary in 1553 was followed by an extreme reaction with the sanction of parliament—under which some 300 persons, including five bishops, were burnt at the stake. The effect of the persecution was not the suppression of heresy, but the development in the popular mind of an intense hostility to Romanism. The general impoverishment and the miserable misgovernment during the two reigns of Edward VI and Mary brought England to such low estate that she was unable to

retain her hold upon Calais, which was retaken by the French in 1558, leaving her without a footing on the Continent for the first time since 1066.

Elizabeth in 1558 found the country in evil case indeed, but with all the elements for a glorious recuperation. An unflinching judgment in the selection of counsellors and instruments, a supreme confidence in the spirit of the nation with which she identified herself, a complete freedom from conscientious scruples, an intuitive perception of the weaknesses of her enemies, a perfect mastery of stage effects, united with an indomitable determination to raise England to the position of the first power in the world, made her the most brilliantly successful of all English monarchs. The national finances were reorganized with a rigid economy which ensured full value for every penny spent.

The question of religion was taken in hand, on the principle of permitting the widest possible latitude of opinion compatible with uniformity in practice, while explicitly requiring the subordination of all authority to that of the state, and rejecting any compromise which implicitly attributed authority to the pope. The enterprise of the seamen who set at naught the Spanish claims to a monopoly of the New World was unofficially encouraged. Nearly thirty years passed before that open rupture with Spain came, but by that time England was ready, and there came the annihilation of the Spanish Armada, in the fight of July 20-August 2, 1588.

#### Period of General Prosperity

A regular government, pursuing a popular policy with conspicuous success and with increasing stability, free from every kind of unsettling capriciousness, encouraged energy and enterprise in every direction. The regulation of trading and apprenticeship, the multiplication of chartered mercantile companies, the gradual readjustment of the rural population to the agrarian upheaval of the first half of the century, and the judicious experiments which culminated in the poor law of 1601, established a general prosperity. The queen ruled, but always with the express assent of her people.

Elizabeth was the last of the offspring of Henry VIII. She was succeeded therefore by the legitimate heir, James VI of Scotland, the great-grandson of Henry's elder sister Margaret. James I (1603-25) came to the throne of England with a title less disputable than that of any monarch since Richard II,

except Henry VIII and Edward VI. By the peculiar cunning which he called kingcraft, he had already acquired for the crown in Scotland a control over the government enjoyed by none of his ancestors since Robert Bruce. James claimed and sometimes tried to exercise the power of overriding the law by divine right; but a wholesome fear of arbitrament by battle always kept him from overstepping the limits of English endurance. He wrought the country up to a high pitch of irritation, destroying utterly the basis of mutual goodwill between the crown and the people, which had in fact been the basis of the apparently despotic authority of the Tudors.

#### Charles's Struggle with Parliament

Charles I (1625-49) reaped the bitter fruits of his father's theories. Elizabeth's parliaments loved her and bore with her caprices. The parliaments of the Stuarts did not love them at all, and were only too ready to discover grounds for quarrelling with the monarch. Charles gave them ground enough by entrusting the direction of policy to his favourite, George Villiers, duke of Buckingham, by standing on what he regarded as his legal rights of raising revenue without sanction of parliament, by overriding the law in the punishment of recalcitrants, and by repressing all latitude of religious doctrine and observance; enforcing his will through the arbitrary powers of the courts of Star Chamber and High Commission.

Charles's parliament, on the other hand, refused supplies until grievances should be removed, asserted the novel claim to a right to the control of religious affairs, and in 1628 compelled the king to accept the Petition of Right, which unfortunately failed of its precise purpose—the accurate definition of the limits of the royal prerogative. Eleven years of arbitrary rule without parliament were ended in 1640 by the arming of Scotland—an independent kingdom to whose king accident had also given the crown of the neighbouring kingdom of England. Scotland found the king's rule too arbitrary; the king could not suppress his Scottish subjects without the aid of English arms; all his expedients had not provided him with the money for an army, and he was obliged to summon the English parliament, and then to dissolve it, and summon it anew.

The Long Parliament, instead of aiding him against the Scots, attainted and beheaded Strafford, impeached Laud, and proceeded to force the king to accept a

series of enactments abolishing the arbitrary courts, and explicitly depriving him of the disputed prerogatives. A *coup d'état*, the attempted arrest of five members on Jan. 4, 1642, failed completely; the king left London, and after several months of futile negotiation, the great Civil War opened in August, 1642.

The struggle was conducted with a decency and humanity which offer a pleasing contrast to the horrors of the Thirty Years' War, then raging on the Continent. After various vicissitudes, the army of the parliament was reorganized by Oliver Cromwell and won the decisive victory of Naseby on June 14, 1645. Charles surrendered to the Scots, who had associated themselves with the cause of parliament, in May, 1646, was by them handed over to the parliament in Feb., 1647, and was carried off into the custody of the army on June 3. From his confinement he intrigued with his own supporters and negotiated with three separate groups—the chiefs of the parliament, the chiefs of the army, and the Scots—each of whom now had different objects in view. The king's attempt to recover his ascendancy by playing them off against each other failed disastrously. His own attempt to escape to France in November, cavalier insurrections, and a Scots invasion in 1648, threw the control into the hands of the victorious army, and determined its chiefs that the king's death was the necessary condition for the restoration of a stable government. An arbitrary court condemned him to death and he was executed on Jan. 30, 1649.

#### The Commonwealth

England was now proclaimed a commonwealth or republic. The Scots recalled the prince who was *de jure* Charles II, but the English Commonwealth could not afford to have the claimant to the throne of England seated on the throne of Scotland. A war with the Scots followed and culminated in Cromwell's crowning victory at Worcester (Sept. 3, 1651), but Charles II made his escape from the country. The remnant or rump of the parliament, which had constituted itself the sovereign body by its own authority, sought to transform itself into a permanent oligarchy, with the result that it was forcibly ejected by Cromwell in April, 1653; and from that time Cromwell, who was made lord protector by the army in December, was virtually the absolute ruler of England. The former champion of parliamentary government found all attempts to work in harmony with the

parliament vain. His government was necessarily arbitrary, but strove at least to be as just as the circumstances permitted, while his vigorous imperial policy, though it helped to raise France to a dangerous height of power, made England feared on the Continent as never before. With Cromwell's death (1658) came chaos. The country was sick of the rule of soldiers and saints, and it was with practically unanimous satisfaction that Charles II was recalled to the throne (1660).

The Restoration meant nothing at all like the triumph of the Stuart conception of monarchy. The country intended parliament to be predominant, and, as far as concerned legislation and taxation, the king found that it was to be neither cajoled nor overriden. But parliament, rendered by the arbitrary Puritan rule of the Commonwealth intensely hostile to Puritanism, which it smote in a series of enactments much more repressive than was at all pleasing to the king, proved no less hostile to Romanism, to the surprise and disappointment of Charles.

Under the mask of frivolity and dissipation, Charles concealed an invincible determination to avoid fighting with parliament but to make himself entirely independent of it by secretly selling himself and the country to the king of France. For 25 years he successfully deceived statesmen, courtiers, politicians, English and foreign, and the king of France himself. On March 28, 1681, with Louis XIV's purchase money in his pocket, he dissolved his last parliament at the moment when its leaders imagined that he was fast in their grip. He had built up a standing army sufficient for his purposes; in the next three years he cancelled and renewed the charters of the boroughs in such a manner that the crown had practically absolute control over their parliamentary elections.

Having no legitimate children, he had secured the succession to his Roman Catholic brother James. His death left James II with all the master cards held but known how to play them skilfully. James did not. The loyalty of the country was turned first into uneasiness and then into grim hostility. When, for the advancement of Romanism, he alienated ardent royalists and fervent churchmen by arbitrarily suspending or overriding the law, men of every party joined in calling to their aid his son-in-law, William of Orange. William landed in Tor

Bay on Nov. 5, 1688. James took to flight, and on Feb. 13, 1689, William and Mary were proclaimed king and queen of England, having accepted the Declaration of Right which laid down what were to be in future the fundamental limitations of the power of the crown—limitations put forward as the historic right of the people. Scotland followed suit and the crowns remained united.

The accession of the stadtholder of Holland, the lifelong enemy of Louis XIV, carried England full into the vortex of international politics. The ascendancy of the English navy, long disputed by Holland, and now for a moment challenged by France, was decisively established and was never again lost save for a moment in 1782. The right of parliament to fix the course of the succession to the throne was established; the state system of finance was reconstructed by the creation of the national debt and the Bank of England. The party system inaugurated by Shaftesbury under Charles II developed steadily. William died on March 8, 1702, at the moment when he had organized the Grand Alliance which was plunging England into the War of the Spanish Succession. He was succeeded by Anne, second daughter of James II, under whom that war was fought out to its issue. But another issue had arisen. Scotland demanded a permanent union with England, upon terms agreeable to herself, threatening in the alternative to name for Scotland another successor to the throne than that of England. On May 1, 1707, the Act of Union came into effect and the history of England as a sovereign state merged into the history of the United Kingdom (*q.v.*).

**Englefield.** Parish and village of Berkshire, England, 5½ m. W.S.W. of Reading. Here Alfred defeated the Danes in 870.

Englefield Green is a residential district in Surrey, 1½ m. N.W. of Egham at the S. of Cooper's Hill. The cottage on the green was the home of George IV's mistress, Mary Robinson, the actress.

**English Bázár** OR ANGRAZABAD. Town of Bengal, India, in the Malda district. It stands on the right bank of the Mahananda river, 56 m. N. of Murshidabad. The East India Company established a silk factory here, and there were also Dutch and French settlements. The chief trade now is in grain. Pop. 19,000.

**English Channel.** Stretch of water separating the S. shore of England from the N. coast of France. It communicates with the North Sea on the E. and the Atlantic Ocean on the W. Its extreme length from the Strait of Dover to a line drawn between Ushant, in France, and Land's End, in Cornwall, is 280 m. Its width from Dover to Cape Gris-Nez is 21 m., from Land's End to Ushant 110 m. Its widest part is between St. Malo and Lyme Regis, a distance of 145 m. Its maximum depth is 70, its average depth 30 fathoms. In the Strait of Dover is a chalk ridge at a depth of 12 fathoms. The bed of the channel is of coarse gravel. England has a coast line of 392 m., while the French seaboard is 574 m. Many rivers discharge their waters into the Channel, notably the Seine. The chief islands are the Isle of Wight and the Channel Islands. Fishing is carried on, particularly for mackerel and pilchard. See Channel Swimming, Channel Tunnel.

**English Horn.** Double-reed wind instrument of the hautboy family. See Cor Anglais.

# ENGLISH LANGUAGE AND LITERATURE

H. C. K. WYLD, M.A., D.Litt., SIR HERBERT GRIERSON, and H. V. ROUTH, M.A., D.Litt

*This article is divided into two sections. The language may be studied further under Alphabet; Phonetics; while for the literature there are articles on the great figures of English literature: Dickens; Fielding; Milton; Shakespeare, and others. See also the general article Literature, and those on various verse and prose forms, e.g. Ballad; Essay; Novel; Ode*

The earliest form of English—from the beginning to about one hundred years after the Norman Conquest—is sometimes called Anglo-Saxon, but nowadays more generally simply Old English. The people who lived in the oldest period called themselves *Angelcynn*, and their language *Englisc* in the vernacular, or, in Latin, generally *Angli*, sometimes *Angli sive Saxones*, and *Sermo Anglicus* or *Lingua Saxonica*. These terms are applied to all the tribes and to all the dialects.

Old English is shown by its vocabulary and its system of inflexions to be a W. Germanic language, closely akin to Old Frisian and Old Saxon, and still closely, though more remotely, to the High German dialects. The resemblances between Old English and Old Frisian are indeed so great and numerous that some regard these two groups of dialects as forming a special branch of W. Germanic speech subsequently differentiated into English and Frisian which they call the Anglo-Frisian branch. From the earliest records three main dialect types in Old English, corresponding to tribal divisions, may be distinguished: the Anglian dialects, i.e. Northumbrian and Mercian; the Saxon dialect; and the Kentish, spoken by the Jutes. The differences between these are comparatively slight, so far as they can be traced in the records, but the subsequent history of the several types is very different. The Angles settled in the N. and Midlands, the Saxons in the S. and S.W., and the Jutes in Kent, the Isle of Wight, and parts of Hampshire.

## The Old English Alphabet

The English, in common with other Germanic tribes, possessed an angular-shaped alphabet suitable for cutting or scratching upon metal, bone, and other hard substances. This is known as the Runic Alphabet, and the letters are called runes. A few inscriptions in this form survive on stones and whalebone, but probably none are much older than the oldest written documents of the ordinary kind. After the introduction of Christianity, the English learnt the art of writing from Irish monks, and the ordinary Old English alphabet is almost identical with that in which Old Irish was written. It was soon found convenient, however, to

borrow from the Runic alphabet two symbols to express characteristically English sounds—þ called "thorn" for *th*, and ƿ called "wen" for *w*. In modern editions of Old English works it is now unusual to reproduce the shapes of the MS. letters, which are printed in ordinary type except þ and ƿ which also stands for *th*; the vowel symbol æ, for the vowel sound in Modern *hat*; and occasionally ȝ the Old English form of *g*. The spelling of Old English, allowing for certain inconsistencies, is on the whole phonetic.

## Sound Changes and Dialect

Perhaps the most important aspect of the evolution of language is the change in pronunciation which continuously proceeds. Sound changes have a far-reaching effect upon the history of every language and bring much else in their train. Not only does sound change alter the whole external aspect and character of a language, so that by this means chiefly, or alone, dialect is often differentiated from dialect, and language from language, but sound change involves the alteration, or it may be the destruction, of inflexional suffixes, whereby the main features of accent are modified or swept away, and these losses of significant endings may, and often do, bring about a revolution in the syntax of the language.

It is now recognized that sound changes are regular in their effects, and that they take place, within a given period and in a given language, according to definite principles and conditions. Within the above-mentioned limitations of time and language and phonetic conditions the same sound will always change in the same way or direction. By the side of regular sound change, the principle of linguistic analogy, or the close association of form with form, whereby one is modified by the other, without normal phonetic development, is recognized as of hardly inferior importance to the action of phonetic laws. It must be remembered that language cannot exist apart from living human beings who speak it, and that change in language implies a change in the physical and mental habits of the speakers.

THE HISTORY OF ENGLISH. The history of English may be said to

have begun from the moment when the group of dialects known as Old English had become differentiated from the parent W. Germanic stock. At the moment of its earliest appearance in a written record, Old English had already undergone a number of characteristic changes which separate it from the nearest cognate languages. Under the conditions of complete geographical separation from the speakers of the other W. Germanic languages of the Continent, English underwent still further independent changes.

While alterations in the consonant changes were comparatively slight, those involving the vowels were considerable. There are two main classes of sound changes: *Isolative*, which arise in the sound of a language in the course of its history, without any discoverable reason, and without any influence exerted by the neighbouring sound in the word or sentence; and *Combinaive*, which result from the influence of one or more sounds in the word, or sentence, upon another sound, or from the effect of the position of the accent or stress in native words, upon the root syllable, not upon the prefix or suffix. In English, unstressed syllables have always been very liable to weakening, and are often eliminated altogether.

The Old English vocabulary is of a characteristic W. Germanic nature, and the great bulk of words are of this origin. There is, however, a considerable element of Latin loan-words: (a) those borrowed during the Continental period, e.g. *stræt* "street," Lat. *strāta* *via*, paved way; (b) those borrowed from Latin-speaking Britons in this country, such as *ceaster*, town, Lat. *castra*, camp; (c) those borrowed from Roman ecclesiastical sources, e.g. *pāpa*, pope.

## Effect of Spoken Latin

Latin must have been freely spoken among the upper classes of the Britons, and in the larger towns of Britain. Several Latin words which expressed ideas for which no equivalent existed in Old English were literally translated, such as *wehwiltend* for *benevolens*. It has been suggested that, if the English invasion had not taken place, the chief language of the country would not be a form of Welsh, but more probably a neo-Latin, or Romance language. Celtic exerted

only a small influence upon the vocabulary in the Old English period, except in the names of hills, rivers, and other geographical features, which retained their old designations—*pen, avon, cumb, dūn*, etc. The Scandinavian influence, which began in the 8th century, shows very slight traces in the written documents before the 11th, by which time the English and the Danes in certain districts had amalgamated, and having passed through a bi-lingual stage, had settled down together, with English as the surviving language in a form which retained many elements of the language of the once hostile settlers.

With the rise of Wessex to the ruling political position among the Old English states, the literary labours of King Alfred made the dialect of this province the chief vehicle of literature. All the works of literary importance, both poetry and prose, which have survived, are written in a form of West Saxon, occasionally with traces of other dialects. This form of English may be regarded as a common literary standard for the whole country from the beginning of the 10th century.

#### From Old to Middle English

The Conquest had at first little effect upon the spoken language. Few Englishmen learnt French for several centuries, and they could not borrow words from a language which they did not know; nor was there any reason why the presence of foreigners ignorant of the native tongue of the country should in any way affect its pronunciation and inflexions. The changes made apparent by the spelling in the middle of the 12th century are not the result of the Norman Conquest, but the normal development of tendencies which were active before the Normans came. The rather abrupt contrast observable in the language of documents from about 1150 onwards does not represent any sudden new development, but implies that the old literary tradition, which largely concealed the facts of speech by means of an antiquated convention, has almost passed away, and that a new literary convention, and to some extent a new scribal mode of spelling, have begun which are nearer to the language of everyday life than was the older tradition.

The language of the last part of the Laud, or Peterborough Chronicle, written soon after 1157, is still in a sense Old English, but many changes are observable. The highly inflected Old English definite article has to a great extent given way to an uninflected form, *þe*,

"the," which never varies, but takes prepositions before it to express case-relations which Old English expressed by inflexion. Such constructions as *þe wrecce men of þe land* "the wretched men of the country," *betwux þe kinges freond and þe earles freond* "between the king's friends and the earl's friends," sound strangely modern. Already in the latter part of this Chronicle the unstressed vowels are fairly regularly written *e*, as in the later Middle English period, to represent Old English *o, a, u* and *e*. The Norman scribes have taught the Englishman the useful graphic distinction between *f* and *v*, whereas the latter formerly wrote *f* for both sounds. The Old English accusative singular of the third personal pronoun masculine, *hine*, has already been lost in favour of the dative *him*, as at present, the feminine pronoun *scæ*, the ancestor of *she*, first appears instead of the old *hæo*.

The present-day use of a preposition at the end of a sentence occurs—*me lihtede candles to eten by* "men lighted candles to eat by." The case-endings of adjectives are largely lost. Although most of the typical Middle English changes in the vowels are not yet consistently expressed in the spelling, there appears an uncertainty and a tentative groping after the best way of expressing a pronunciation which is evidently changing. As regards vocabulary, a few French words are used, all more or less technical, expressing new and foreign conceptions or institutions, offices or titles—*canceler, prisun, cuntesse, emperice*. The only word which might be considered non-technical and belonging to everyday life is *pais*, "peace." A few new Scandinavian words are used: *tōc* "took," and *oc* "and." The usual English words *niman* "take" and *and* are also used.

#### The Middle English Period

This may be held to begin about 1200. The process of change is more rapid in the dialects of the N. and those of the E. Midland than in those of the S. and of the S.W. Midland. In the N. especially the loss and confusion of flexional endings has gone very far by the beginning of the 14th century. A characteristic of the Middle English period is the great dialectal variety which finds expression in the written documents. The main types are the N., which includes the dialect of S. Scotland; the E. Midland; the W. Midland; the S.W. Midland, including the dialects of Herefordshire, Worcestershire, Oxfordshire, and Shropshire; the S. dialect, including all types as far

E. as Surrey; the S.E., including the speech of Kent and Essex. The London dialect, which in its earliest forms shows a mixture of purely S. with Kentish or S. Eastern forms, becomes increasingly important from the first quarter of the 14th century onwards.

#### The London Dialect

Early in the 14th century the London dialect is still largely pure S. in type, that of Surrey and Middlesex, but shows certain Kentish or S.E. features, and a slight tinge of E. Midland. By the end of the century, Chaucer and those of his contemporaries who write in this dialect show an increasing number of purely E. Midland features, rather strong S.E. influence, and a certain survival of S. characters. Chaucer is fairly representative of the best London and court English of his day. Owing to the political and commercial importance of the capital, the type of English there spoken was naturally bound to become the leading variety in the country, and the prestige of Chaucer and the popularity of his writings led to many imitations, not only of his style but of his dialect, even among writers who did not speak London English.

Nevertheless, for the most part, throughout the 14th century, people continued to write in the dialect which they spoke. The beginnings of a change may be seen when Chaucer's contemporary, Gower, writes, not in the Kentish dialect which was naturally his own, but in a close approximation to that of London, with but few provincialisms to betray his native dialect. The Middle English period may be said to close with the death of Chaucer, or in the first quarter of the 15th century, and soon after that date there are no more literary works written in pure provincial dialect, except in Scotland, which had a standard of its own, so that the history of English centres more and more round that one form which has become the universal standard. But while the London type predominates increasingly in written documents of all kinds, from whatever area, there are plenty of traces, far into the 15th century, of the provincialisms of the writer's native speech.

The vocabulary of Chaucer is very largely our own. He uses Norman French words, not here and there, like early Middle English writers, but as indispensable elements of his style. Norman French words are no longer foreign, but hundreds have penetrated into the very fibre of English speech, and it is not very easy to write many consecutive sentences not containing words of

this origin. Norman French having been the language of the upper classes for nearly 300 years, and the official vehicle of law and government, was abolished in courts of law in favour of English in 1362; in 1385 it was no longer used in schools; by the end of the century it was probably dead as a spoken language. The Scandinavian element is very large in Middle English in the N. and E. Midland dialects.

#### Modern English

The chief event in the general history of English since the beginning of the 15th century has been the gradual acceptance of a virtually uniform dialect by all writers. This agreement was greatly helped by the introduction of printing in 1477. Caxton, himself a Kentishman, adopted the London dialect for his translations and prefaces, and a knowledge of this type was rapidly diffused throughout the country through his labours. Even in the mid-15th cent. provincial or regional dialect was falling into disuse in writing.

The adoption of a standard of spoken English was a much slower process. George Puttenham, in his *Art of English Poesie* (1589), says that in the N. noblemen and gentlemen spoke their own dialect; Aubrey has it from one who knew Sir Walter Raleigh that he spoke broad Devonshire all his life. In the 17th century comedies country gentlemen who come to London for the first time are made to speak a broad rustic form of English, and as late as the 18th century Fielding makes Squire Western speak pure Somersetshire. It was the language of the court which in Elizabeth's day was recognized as the best form of spoken English, and upon this the literary English of the day, the ancestor of our own, was based. The English of Caxton is virtually the descendant of that of Chaucer. The differences between the two are due chiefly to the growing encroachment of the E. Midland element in London English since Chaucer's time.

Since the Middle English period English pronunciation has changed considerably, although the conventional spelling handed on, with few modifications of importance, from the early printers who derived it from the professional Middle English scribes, reveals next to nothing of this. All the long vowels and all the Middle English diphthongs have altered completely in character. Many changes in the pronunciation of consonants have also taken place, though some of these have since been

"restored" through the influence of the received spelling. The same factor has influenced to some extent the pronunciation of unstressed vowels which in the Early Modern period had undergone considerable weakening.

It is a necessary result of the recognition of a standard dialect, which in origin was that of the upper classes, that other forms fall into disrepute, and are considered either vulgar or merely provincial and rustic. The latter epithets are now applied to the modern regional dialects, while the former justly applies to certain forms of English, cognate with the best form of spoken English in origin, but differentiated from it in the mouths of the humbler and less refined classes of society. The principal sound changes were probably complete, or at least well under way, by the end of the 16th century, though the final distribution of the various dialect types which compose standard English was not yet finally settled. The subsequent history of standard spoken English is very largely the result of the influence exerted upon this by other class dialects, and to some small extent by regional or provincial dialects.

#### Modern English Sound Changes

The changes made in the English vowel system from the "Continental values" to approximately our present pronunciation are traceable from occasional spellings of the scribes, in some cases as early as the early 14th century, very clearly and frequently in the 15th century, when private letter writing began to be practised by all sorts of persons, and in the 16th and later periods, not only from this source, but also from deliberate descriptions of English pronunciation. Most of the typical modern vowel changes began very early, but acceptance of many of these in court English was considerably later than the 15th century, and some appear to have been accepted only in a few words. Many of them were considered vulgarisms at first, and penetrated into the standard language through the influence of lower class London English. Many pronunciations used by the best speakers during the 17th and 18th centuries would now appear vulgar, rustic, or, at least, antiquated. Among these may be mentioned *sarvis*, *sarvant*, *sarmon*, *vartue*, *Booshop*, *gould*.

There is ample evidence from the 15th century onwards that the present day natural pronunciation of the vowels in unstressed syllables either with the "murmur vowel" (ə) as in second syllable of *father*,

or with *i* was already in vogue. In the 18th century words with *on* were often pronounced as with *in*, e.g. *flaggin*, *dunjin*, *sturjin* for *flaggon*, *dungeon*, *sturgeon*, etc. The ending *ure* was pronounced like *-er* far into the 18th century—*jointer*, *picter*, *nater*, etc. Such a word as *fellow* was pronounced *feller* (without *r*), and Pope rhymes it with *prunella*. The present-day pronunciation of the suffix *-es*, *-est*, *-eth*, etc., as *-iz*, *-ist*, is already established as the polite one in the court English of the 15th and 16th centuries by such spellings as *horstis*, *princis*, *eldist*, *givith*, etc.

#### Spelling Pronunciation

In the 18th century *nus*, *pus*, *Ushy*, *thusty* are the spellings of a writer on pronunciation to express the proper forms of *nurse*, *purse*, *Ursula*, *thirsty*. The ending *-ing* was pronounced as *-in* as early as the 15th century, and this was probably universal in standard English until the end of the first quarter of the 19th century, when the spelling-pronunciation won the day to some extent. Usage now varies. The loss of the sound of *gh* in the middle of words before *t* is shown to have been caused in the 15th century by the omission of the symbol in words where it belongs historically, and by such spellings as *dought* "doubt," *ought* "out," *wright* "write." In the 16th century even Spenser often writes *whight*, *quight*, etc. The sound of *w* develops initially before *o* and *ho*; *won* for *one* is fairly common in the 15th century, and in the 16th occurs in the letters both of Henry VIII and Elizabeth. The spelling *whole* has been retained. Consonants are often lost, finally and in combinations, as is proved by spellings from the 15th century onwards.

Similar pronunciations are recorded in the 18th century. The following 15th and 16th century spellings show losses in combinations in the middle of words: *Whysson weke* "Whitsun"; *Wensday*, *morgage*, *sepukyr*, *Wostreet* "Wood Street." Queen Elizabeth herself writes "often" *offen*. *Lunnon* was a polite 18th century pronunciation. Many of these forms survive at the present time, but the consonants are now often restored from the spelling. At the beginning of unstressed syllables *w* was normally dropped already in Middle English. It has been largely restored, however, through the influence of the spelling. While *w* is still omitted in *Norwich*, *Southwark*, etc., it has been restored in *forward*, earlier *ferrard*, *Edward*, etc. *Eddurd* was the polite 18th century pronunciation, and

survived among old-fashioned speakers far into the 19th.

Weak plurals are more frequent among good writers in Early Modern English than now, e.g. *housen, shoon, eyen, All Soulen, peasen*. The old feminine possessive without *-s* is found commonly as late as the 16th century—*Our Lady Mary Grace, the Queen Grace*, etc. These survive now in *Lady Chapel, Lady Day*. The personal pronouns *her* (possessive) and *hem* (dative plural) are frequently used in the 15th century by the side of *their, them*. The former is apparently not found after the early 16th century; the latter is rare in the 16th and early 17th, but reappears in the 18th century as *'em*. "Group inflexion" in the possessive of nouns is found as early as the 15th century—the *erle of Wiltones wyf*—by the side of the older construction, the *dukys daughter of Northfolke*. Such constructions as *for Jesus Christ His sake* are very common in the 15th and 16th centuries, the pronoun being often detached and written *is*, and sometimes joined to the preceding noun as a possessive suffix, which it originally was.

The old Southern present plurals of verbs in *-eth* linger on in occasional literary and colloquial use far into the 16th century, though the form without ending is far commoner. In the 15th century the forms in *-en, -in* are still often used. The third person present singular ends in *-eth, -ith, or -th* during the whole of the 15th and 16th centuries in the best English. The forms in *-s* come in gradually, at first chiefly used either in poetry for the sake of rhyme or metre, or in fairly colloquial style. They are by no means universal by the end of the 16th century. *Hath* and *doth* survive far into the 18th century in both colloquial and literary use. Pope uses *was after you*, when one person only is addressed. This practice survived in good colloquial use into the 19th century.

#### Shifting Standards of Correctness

A careful study of the history of English from the earliest times, based on intelligent interpretation of the written records of the successive ages, leaves an impression of continuity amid perpetual change. The history of standard English during the last 500 years has been largely one of the varying distribution of elements drawn first from regional and later from social dialects. The standards of what is polite and correct shift from age to age. What is vulgar in one generation becomes the

pattern of propriety in the next; that which was elegant and habitual to the most refined speakers is felt to be slipshod or worse. Since the early 19th century there has been a great striving after "correctness" in English speech. Our speech today is far less untrammelled in its colloquial forms than that of the 17th and 18th centuries. Good speakers then seem to have been content to follow the natural tendencies of unstudied utterance, and were less anxious for "correctness" as this was later understood. This process is still going on and, with the increased diffusion of education among those who have no traditional knowledge of the best speech, bids fair to alter our language out of all recognition.

#### Assimilation of Idiom and Jargon

From three main sources, obvious especially in colloquial speech but also in writing, come the contributions of the 20th century to the growth of English vocabulary. The influence of the cinema has added a deposit of American words and idioms, several of them new inventions, but many, e.g. *crack* for witticism, recrossing the Atlantic to the land in which they were current centuries ago. There is a tendency to apply semi-technical terms from the sciences, like *complex* and *allergic*, or from warfare like the nouns *drive* and *front*, in metaphorical and often inappropriate contexts. Old boundaries between parts of speech are broken down by turning nouns into verbs (*telephone, contact*) or into adjectives (*railway journey, control board*). If it be claimed that these tendencies enrich the language and make it more responsive to the subtleties of expression needed in a world of specialists, there is also the result that layers of jargon are spread over the pattern of what used to be regarded as lucid English. But a language already so indebted to foreign tongues can know no logical ban upon further borrowing. The best hope is that the more tawdry pieces of the new coinage will not be allowed to continue in circulation.

It is impossible to foretell the future of English, though we may well believe that it will be no meaner or less splendid than its past. New standards of speech will in all probability arise with the growth of new centres of culture in this country, and still more in the dominions, whose populations are still "mewing their mighty youth," and future historians of spoken English will have to take into account the many

varieties of our mother tongue, spoken by peoples of different experiences and modes of life.

H. C. K. WYLD

LITERATURE. Anglo-Saxon literature is interesting rather as a document illustrating the spirit of the English stock, Angles and Jutes, than as a direct ancestor of English literature as traced from Chaucer. For modern English literature does not derive directly from Old English literature. From the 11th century, even before the Conquest, to the 14th century, England was a pupil in the school of France. For the greater part of this time Latin was the language of learned, French of polite, literature. For three centuries English and French jostled together, with the result that when at last in the 14th century English came into its own, it had become the rich composite speech, in vocabulary and syntax, which was to be the medium of English poets from Chaucer to the present time; and in the same centuries, English poets gradually assimilated, adapting it to the genius of the English language, the syllabic, accental metre which had been first heard in the Latin hymns of the Church and Provençal and French song.

#### English Versions of French Themes

French literature itself was only beginning when the Normans conquered England, but in the 12th and 13th centuries the French poets of Provence and Gascony, of France proper, and of England, created the romantic and lyric literature which is the fountain-head of all modern European literature. The new love-poetry of Provence, with its courtly and ideal, but also conventional, cult of love, the romances of Charlemagne, of Arthur and his knights, of Troy, Thebes, and Alexander, beast-epic and allegory and fabliau—these were made by the French familiar to every country of W. Europe and reproduced in other tongues. In the creation of this courtly literature as such England took no part; but when English literature began to awaken again it was in the reproduction of French themes and forms.

The first English poem written after the Conquest, which is really a work of literature, Layamon's *Brut*, is a long and interesting elaboration of that legendary history of Britain, from Brutus to Arthur, which had first taken the shape of history in the *Historia Regum Britanniae* of Geoffrey of Monmouth, and had been already cast into verse by the Norman

poet Wace. But Layamon makes interesting additions from Welsh oral tradition. The verse is apparently intended to follow the Old English model, but is rapidly approximating to an English reproduction of the French octosyllabic or four foot verse, the long line falling into two parts. Even in religious and didactic works of no great literary merit, the *Ormulum*, the *Bestiary*, etc., we can note the interaction of old English form and feeling with the new influences; but the full effect of French inspiration in the begetting of a new literature, fresh in spirit and in form, is seen in the lyrics and the romances of the 13th and early 14th centuries.

#### Early Lyrics and Romances

The earliest English lyrics, songs like *Sumer is i-cumen in*, *Lenten is come* with love to town, are the work of poets familiar with the French lyric, its rhythms and its tone, gayer than that of Old English poetry. They blend in humorous fashion lines English, French, and Latin. The same is true of the first English romances, all probably translations, even when, as in *King Horn*, *Havelok the Dane*, *Richard Coeur de Lion*, *Bevis of Hampton*, and *Guy of Warwick*, they deal with native legendary themes. And all the varieties of French romance, Carolingian, e.g. *The Sowdone of Babylon*; Arthurian, e.g. *Lybaeus Desconus*; Oriental, e.g. *King Alisaunder*; classical, e.g. *The Destruction of Troy*; and miscellaneous romances of adventure, e.g. *Ipomydon*, are represented.

All lack the courtly tone of French romance, being composed for popular audiences who love a genially told story of adventure rather than refinement of sentiment. In their diction we see the shaking together of the elements, English, French, and Scandinavian, which make up the rich tongue of Shakespeare and Milton; while in the metrical, not alliterative, poems, we can trace the process by which the syllabic rhythm of French verse was adjusted to the idiosyncrasies of stress and cadence in English pronunciation. Outside romance and lyric, poetry of the 13th and early 14th centuries is didactic—the *Cursor Mundi*, a long paraphrase of Scripture history and Church legend; the *Pricke of Conscience*, a summary of theology, erroneously attributed to Richard Rolle of Hampole, a writer of mystical works in Latin and English prose; Robert of Gloucester's verse histories, and other works.

The 14th century witnessed the victory of English over French, even at court. In the same century appears an English poetry artistically on a level with the best of France and Italy. The movement to raise the artistic level of poetry took two directions. One was an artificial and abortive attempt to revive and elaborate, with or without the addition of rhyme, the old alliterative verse—a movement which produced the finest of the English romances, *Gawain and the Green Knight*; the beautiful elegiac and symbolic poem, *The Pearl*; and the interesting, if inchoate, satirical, didactic, and mystical poem known as *The Vision of Piers Plowman*, attributed to William Langland, of whom the poem supplies a shadowy outline.

But the future of English poetry lay with those who completed the naturalisation of French poetry, its regular metre, its refined and courtly spirit, its grace and elegance of style. John Gower, after experimenting in a satirical Latin poem, and a tedious didactic poem in French, composed at the close of his life a long poem in English, *Confessio Amantis*, in which he sets in the framework of the confession of a lover to Genius, the priest of Love, a series of stories drawn from many medieval and classical sources and narrated in smooth, equable, well-turned octosyllabic couplets.

#### Spirit of Chaucer's Poetry

Geoffrey Chaucer, however, did more than this. Brought up at court, and sent in later years on missions to various lands, including Italy, Chaucer was educated in the tradition of contemporary French poetry. His earliest poem, *The Book of the Duchess*, is an elegant but jejune dream allegory, a love poem whose incidents are represented as happening in a dream, the characters being personified abstractions. But the majority of Chaucer's extant poems were written after he had made acquaintance with the Italian poetry of Dante, Petrarch, and Boccaccio.

The *House of Fame*, an incomplete, ironical allegory, shows the influence of Dante in style and incident. The *Parliament of Fowls* enriched its decorative fabric with borrowings from Boccaccio. Chaucer's first and greatest dramatic story, *Troilus and Criseyde*, is based on the same poet's *Filostrato* with an incident from the *Teseide*. The *Teseide* itself is the source of the chivalrous story of *Palamon and Arcite* which became the *Knight's Tale* in *The Canterbury Tales*. The

stories collected in the *Legend of Good Women* are drawn from Ovid and from a couple of Latin works by Boccaccio. The charming Prologue to the poem is Chaucer's own.

But much as Chaucer learned from Italy, the more serious and idealistic spirit of Dante and Petrarch did not pass into his poetry. That transmission was reserved for the 16th century. To the end the spirit of Chaucer's poetry is that of the French love-poetry, allegoric and romantic, qualified by his own bent towards a more realistic and humorous handling of conventional themes. The latter bent achieved its complete emancipation in the Prologue to *The Canterbury Tales*, with its vivid and ironical pictures of all the social types of the England of the 14th century.

#### Chaucer's Successors

The best of the tales are in the vein of the Prologue, fabliaux, satiric tales, told with consummate dramatic and poetic art. Only in the fragment of *The Squire's Tale* does the poet reopen the well of pure and enchanting romance. Chaucer gave England a courtly poetry superior in dramatic and poetic interest to the poetry of France. He embellished it with beauties derived from the great Italian poets. He breathed into the whole a spirit entirely English, and in his hands the English language attained to all but the highest perfection of poetical diction and metrical beauty.

Chaucer had no adequate successors for nearly two centuries. John Lydgate and Thomas Occleve kept faintly burning the tradition of didactic allegory and story, and handed on the lamp to its last representative, Stephen Hawes, author, in Henry VII's reign, of *The Pastime of Pleasure*. In Scotland this courtly poetry enjoyed a brighter S. Martin's summer.

The popular literature of the 15th century is of greater interest than the courtly. The religious drama, the mysteries and miracle plays, reached their highest level in the 14th century, and gave place in the 15th to the moralities. To the 15th century probably belong also the oldest of the ballads which, taking the place of the longer lays, preserved the quintessence of the old romances in a way that was to quicken the romantic spirit with surprising and delightful results in later English poetry. Of artistic prose in Middle English, the tentative beginnings may be best studied in Chaucer's translation of Boethius. The 15th century witnessed a fairly steady advance of

prose as an artistic medium whose finest result is the *Morte d'Arthur* of Sir Thomas Malory.

The revival of learning in the 15th century made Italy the centre of influence in literary fashions as definitely as France had been so in the 12th and 13th centuries. That influence came to England in two successive waves—from Italy direct in the reign of Henry VIII. from Italy by way of France in the reign of Elizabeth. Stephen Hawes was still writing dull allegory, and John Skelton was burlesquing the same in individual fashion; the older tradition of amorous and gay songs and carols after the French manner was still in vogue with Henry VIII and his musicians; when Sir Thomas Wyatt and Henry, earl of Surrey, having "tasted the sweet and stately measures and style of Italian poesie," began to cultivate this more dignified and passionate note in sonnets, in irregular imitations of the canzone and other Italian forms, and in songs, all published after their death in Tottel's *Miscellany* (1557).

#### French and Italian Influences

The twenty years which followed was a period of arrested development and of experiment, especially in verse translation from Latin, e.g. Arthur Golding's *Ovid*. The one bright ornament is Thomas Sackville's *Induction* and *Legend of the Duke of Buckingham*, contributed in 1563 to *The Mirror for Magistrates*, which, apart from these poems, was but a dull continuation of Lydgate's moralising "tragedies," and sentimentously narrated stories of the overthrow of great men through the fickleness of fortune.

When the *Shepherds' Calender* of Edmund Spenser appeared in 1579, the artistic influence of Italy and France was reacted upon by the temperament of a people whose national self-consciousness had grown eager and intense, and whose spiritual life was being profoundly modified by that religious Reformation which tended to separate them from the Latin peoples who were their artistic tutors. The result was naturally complex, a literature at once national and exotic, at times Italian in its dissolute moral tone, again already growing Puritan in its moral ardour, rich in felicities and beauties of style and verse, yet abounding in fantastic extravagances.

Spenser's pastoral, *The Shepherds' Calender*, his allegorical romance, *The Faerie Queen* (1590-96), and all his shorter poems, satirical, elegiac, and lyrical,

reveal the influence of French and Italian poetry, of Italian Platonism, of Chaucer and of Sir Thomas Malory; but the spirit which strives to harmonise the whole is that of an Elizabethan Englishman passionately patriotic and Protestant. And if much remains unharmonised, the discords are held in solution by a style diffuse in picture and melody, a verse in which the grave iambic movement of Sackville's *Induction* is heightened by every resource of varied cadence which English metre permits, and adorned with all the accessories of alliteration and vowel-music which English verse welcomes.

Of all the exotic forms naturalised by Wyatt and Surrey, the sonnet enjoyed the greatest popularity in the closing decades of the century. One sequence of love sonnets, after the fashion of Petrarch's *Laura*, followed on another in rapid succession, including Sir Philip Sidney's *Astrophel and Stella*, Samuel Daniel's *Delia*, Michael Drayton's *Idea*, Spenser's *Amoretti*, and the later published *Sonnets of Shakespeare*. The Elizabethan sonnets are largely translations and imitations, and abound in the conventional and extravagant conceits which are common to the kind, while few or none have the exquisite perfection of form which makes Petrarch a classic. But on the best of the English sonnets, as on Michael Angelo's, is set the impression of personality, the insolent gallantry and passion of Sidney, the brooding thought, the self-abnegation in friendship, of Shakespeare.

#### Elizabethan Poetry

The same poets experimented in many kinds, e.g. in the decorative Ovidian idyll, as Marlowe's *Hero and Leander*, Shakespeare's *Venus and Adonis* and *Rape of Lucrece*; and the same overwrought rhetoric characterises Daniel's *Rosamund*, a continuation of the *Mirror for Magistrates* type of story, and Drayton's antithetic imitations of Ovid's *Heroides*, imaginary love-letters in verse, England's *Heroical Epistles*. But Daniel and Drayton cultivated a severer style in their historical poems, suggested by Lucan's *Pharsalia*, Daniel's *Civil Wars* between York and Lancaster, and Drayton's *Barons' Wars*.

Daniel, George Chapman, Drayton, Sir John Davies, author of *Orchestra* and *Nosce Teipsum*, John Donne, Sir Henry Wotton, and others cultivated a grave philosophical poetry, frequently epistolary in form, in which Stoicism and Christianity are blended. Distinctively religious

poetry, whether Roman Catholic, like Robert Southwell's *St. Peter's Complaint* and Henry Constable's *Spiritual Sonnets*, or Protestant, like Joshua Sylvester's translation of Du Bartas' *Divine Weeks and Works*, shows the same elaboration of style and sentiment. The crown of Elizabethan verse translations are George Chapman's *Iliad* and *Odyssey*.

The greatest and happiest work was achieved in drama and song. In the closing decades of the century a new impetus was given to song writing by the study of lute music and the coloured, cadenced lyric of the French renaissance poets, Ronsard and his fellows, with the result that a lyric of many moods, and a new wealth of imagery and harmony, adorned romance and drama, or was garnered in song-books and anthologies such as England's *Helicon* and Davison's *Poetical Rhapsody*. Songs were composed by all the poets of the day, and many of the most charming are anonymous.

#### Growth of the Drama

The drama is a larger subject, and its history in the 16th century is one of shifting and confusing development, of overlapping kinds, of natural evolution crossed and disturbed and directed by extraneous influence. The *Morality*, which had produced in the later 15th century such a fine flower of serious drama as *Everyman*, was responsible in the 16th for the impressive *Cradle of Security*. Farce of a realistic kind—thumb-nail sketches of low life in London—mingles with the serious element, especially in *Moralities* dealing with the follies of youth.

The general tendency of the *Morality* is to be dull, and this was intensified by the Renaissance schoolmaster's love for the didactic, as in John Rastell's *Interlude of the Four Elements*, by such political allegory as *Lord Governance*, and by the Reformation passion for polemic, as in John Bale's *The Three Laws*, etc., *Lusty Juventus*, *Respublica*, and others. Queen Elizabeth checked this intrusion into controversy. The same Bale's *Kyng Johan* and a play like Thomas Preston's *King Cambyses*, or the weird version of Aeschylus's great story, *Horestes*, show how *Morality* blended with story and developed into the characteristically Elizabethan product, the story play, serious or farcical, or more commonly a blend of both.

Classical influence made itself felt, here as in other countries, in attempts to reproduce the exact

form and features of Seneca's Latin tragedies, *e.g.* in Sackville's *Gorboduc*, and of Latin comedy, *e.g.* Nicholas Udall's *Ralph Roister Doister*. The attempt miscarried, and the dominant type of play of the '60's and '70's was the story-play, the play which brought on the stage all the crowded incidents, dramatic and undramatic, of a story drawn from any and every source, with little interest of character and no beauty of style. The artistic, refining effect of classical and Italian influence made itself felt when into these story-plays was breathed something of the spirit of ancient comedy and tragedy, and they were clothed in a new beauty of form, prose and verse.

#### Marlowe and Shakespeare

John Lyly led the way in the reform of the drama as literature with his light and graceful, if flimsy, mythological and courtly comedies. George Peele sweetened the versification and brightened the fancy of comedy and romance, and Robert Greene is mainly responsible for the woodland settings and the fair maidens of Shakespeare's *As You Like It* and *Twelfth Night*. Thomas Kyd achieved a success by his *Spanish Tragedy*, which popularised the melodramatic revenge-motive and the stilted rhetoric of Seneca, while eliminating the choruses and loosening the structure. But the great forerunner of Shakespeare was Christopher Marlowe (*Tamburlaine*, *Dr. Faustus*, *Edward II.*), who gave to serious English drama stateliness and splendour of form, while quickening within it the soul of dramatic interest. His blank verse is the overture to the fuller, more varied harmonies of Shakespeare and Milton.

In William Shakespeare a great tradition found its fullest expression. The statue had been blocked out, the tools were ready to his hand. It was no restraint to him, it seems rather to have been a help, to revise older work, to collaborate with lesser men. But the miracle of genius remains. The tradition broke into a new life in his hands. The old play, the lesser dramatist, found through him their fulfilment. He neither led nor followed, he moved instinctively with the changing currents of taste. His early tragic histories, *Henry VI* and *Richard III.*, are Marlowesque in spirit and style; his early comedies and romances, *Love's Labour's Lost*, and *A Midsummer Night's Dream*, absorbed and enriched all the currents that flowed more faintly in Lyly and

Peele and Greene. As the century draws to an end he satirises the bombast of Marlowe and Kyd through *Ancient Pistol*, and Lyly's *Euphuism* in the wit of *Falstaff*, and blends heroic history, full of the same spirit as *Daniel's* and *Drayton's Chronicle* poems, with genial and boisterous comedy.

And when Jonson turned drama from romance to realism, Shakespeare passed to tragedy, tragedies of character and adverse stars in *Hamlet* and *Julius Caesar*, tragedies of great souls driven from their orbit by passion to clash and destroy and perish in *Othello* and *Lear*, and the style and imagery and verse change with the change of theme. Lastly, when Beaumont and Fletcher revive the *futings* and *falseto* of romance, Shakespeare, too, turns back to the charm of romantic setting and pathetic lovers and children and flowers and poetry and reconciliation. He works with all his fellows, but gives to each kind of play an infinitely richer dramatic and poetic worth.

English prose in the 16th century felt the influence of Latin in vocabulary and structure. The prose of the 16th century—of John Fisher, Thomas Elyot, Roger Ascham, Thomas North, and others—is a happy blend of simple, direct, colloquial English, with a free importation of Latin words and a sentence shaping towards the Latin period. The finest product of this are the translations of the Bible, from Tyndale to the *Authorised Version*, a book which has shaped and coloured, as perhaps no other, the diction and rhythm of the best English prose and verse.

#### Hooker and English Prose

For the last two decades of the century prose, like verse, came under the influence of the taste for elaborate rhetoric. Lyly's *Euphuism* set the fashion of antithesis, alliteration, and artificial simile for a succession of imitators in novels and pamphlets, Robert Greene, Thomas Lodge, Thomas Nash, and Thomas Dekker; though in Nash and Dekker a racy colloquialism blended with and superseded the tricks of *Euphuism*. Sidney cultivated a more poetical rhetoric in his *Arcadia*, and, with much less of artifice, in the *Defence of Poesie*. Richard Hooker, in the *Ecclesiastical Polity*, raised the Latinised, periodic prose to a higher level of rhythm, and dignified eloquence, and made English a fitting medium for philosophical disquisition.

The literature of the earlier 17th century is as varied in character as that of the 16th. The first fifteen

years witnessed the culminating achievement of the drama in Shakespeare's great tragedies and the sombre, extravagant, but impressive work of Marston, Chapman, Middleton, and Webster, and in the sardonic, unromantic "humours" comedy of Ben Jonson and his classical tragedies. In the work of Beaumont and Fletcher, Massinger and Ford, Shirley, and smaller men, we study the setting of a brilliant day in a sky rich in the colours of sentiment and phrasing.

#### John Donne and Ben Jonson

In poetry Spenser found no follower in the endeavour to revive, and give a new significance to, the chivalry of medieval romance, though Ariosto and Tasso were translated by Sir John Harrington and Edward Fairfax. But Spenser's pastoralism was variously tuned by many poets, as William Browne, *Britannia's Pastorals*; and Drayton, *The Muses Elizium*; and the Scottish Drummond of Hawthornden, a late Elizabethan, in his Italianism and his love for sonnets and pastorals. The didactic, allegorical, religious aspect of Spenser's work appealed more strongly than the romantic and chivalrous to ardent Protestants like the poet brothers Giles Fletcher (*Christ's Victory and Triumph*) and Phineas (*The Purple Island*).

None, however, of these overflows from Elizabethan poetry, modified by the changing spirit of the time, represents quite clearly the two main directions in which literature moved during the century, on the one hand towards an increasing weight and fullness of thought and conceit, to which is sacrificed grace and beauty of form and verse, on the other towards more definiteness, uniformity, and correctness of style and verse. The dominant influences in this two-fold movement are the late Elizabethan poets, John Donne and Ben Jonson. The poems, erotic, satirical, complimentary, and religious, of the former fascinated all the younger, bolder spirits by their intellectual subtleties and passionate perversities of feeling, their rugged strength and frequent felicities of phrase, their contemptuous violations of smoothness and sweetness in versification with the deep and plangent harmonies which none the less they repeatedly achieve.

Ben Jonson, in his songs and epigrams and odes and verses, complimentary and satirical, combines the same compacted pregnancy of thought with a constant, though not always successful, striving after

classical definiteness of form, classical finish, and felicity of phrasing. The influence of both is obvious in English poetry to the time of Cowley and Dryden. Jonson's and Donne's best disciples are the courtly lyrists, Thomas Carew, Richard Lovelace, John Suckling, Thomas Stanley, and a host of others down to the earl of Dorset, the earl of Rochester, Charles Sedley, Aphra Behn, and John Dryden himself in the years after the Restoration. The greatest of them, as artist and poet, is Robert Herrick, the greatest Epicurean and fanciful songwriter in our literature. The influence of Donne, his metaphysical wit and his passionate egotism, is most directly traceable in the religious poets, Anglican and Catholic—George Herbert, The Temple; Henry Vaughan, *Silex Scintillans*; Richard Crashaw, *Steps to the Temple*, and *Carmen Deo Nostro*; in Thomas Traherne, and others. But, together with Donne's influence, that of Italian religious poetry, with its sugared conceits and the mysticism of Spanish writers, as S. Theresa and John of the Cross, can be recognized.

#### The Poetry of Milton

The greatest of seventeenth century poets, John Milton, shares the taste of his age for compacted thought and multifarious learning while despising its fantastic and metaphysical conceits. In his poetry, Ben Jonson's ideal of classical form and finish is ministered to by a finer ear and by a poetic temperament and imagination as spontaneously creative as those of the greatest Elizabethans. The early Cambridge and Horton poems, the *Nativity Ode*, *At a Solemn Music*, *On Time*, *L'Allegro* and *Il Penseroso*, *Arcades*, *On the Marchioness of Winchester*, *Comus*, *Lycidas*, combine the spontaneity, fancy, and ravishing music of Spenser and Shakespeare with a consciously elaborated art, architectonical, stylistic, and metrical, which, on this scale, was a new thing, and has never been surpassed in the history of English poetry.

*Paradise Lost* is built from the stern experiences and the rigid political theology of the years of rebellion and pamphleteering. The freshness and charm of the earlier poems are gone, but their loss is compensated for by grandeur of epic creation in incident, character, and setting, and by the most majestic and harmoniously modulated blank verse which English ears have ever heard. *Paradise Regained* is a paler reflex of these qualities, but into *Samson Agonistes*, Milton's experiment in classical tragedy, he poured the passion of his own

sufferings and the defeat of his cause, the pride of his defiant will, clothing them in words and measures as sublime as they are severe.

But the movement towards classification, definiteness, and perfection which fulfilled itself so strikingly in Milton followed a line of less resistance in the work of Edmund Waller, John Beaumont, John Denham, William Davenant, and Abraham Cowley. In Cowley's *Mistress* and *Pindarique Odes* and *David's* the extravagances of the earlier period are made the more obvious by the subsidence of the imaginative passion which in Donne inspired and condoned for these; but the common aim of the others, conscious or unconscious, was the rejection of this extravagance, the limitation of the pattern which verse might follow, and the exaction of a higher degree of correctness within that pattern.

The movement was carried to a triumphant success by John Dryden, a far inferior poet to Milton, but the first and among the most accomplished of English men of letters—dramatist; poet, eulogistic, lyrical, satiric, and didactic; translator; literary critic; and essayist. In Dryden's verse and prose the English language is written as we still use it; he is our first modern. His satires, as *Absalom and Achitophel*, and didactics, as *Religio Laici*, *The Hind and the Panther*, are an idealised reflection in verse of easy, masculine conversation or eloquence. His odes are our supreme examples of lyrics in which there is not a note of song but all is artfully managed noise and declamation. Working within a still more limited pattern, Alexander Pope achieved, in the next generation, a yet higher degree of pointed and polished perfection.

#### Dryden and Pope

Nothing can surpass in its own way the eloquence of *Eloisa* to *Abeard*, the satirical miniature-painting of *The Rape of the Lock*, the aphorisms and declamations of the *Essays on Criticism* and *Essay on Man*, the condensed, polished, poisonous satire of the *Dunciad*, *Moral Essays*, and *Imitations of Horace*. Dryden and Pope are the high priests of a school of poets including *Prior* and *Gay* among their contemporaries and a succession of elegant, conventional poets, continued to the end of the century and beyond, whose work may be studied in a collection like *Dodsley's*.

The Restoration drama of England is represented by the high-flown and absurd, but eloquent, heroic plays of Dryden, the path-

etic, rhetorical tragedies of Nathaniel Lee and Thomas Otway, the brilliant, polite, licentious comedy of George Etherege, George Farquhar, William Wycherley, John Vanbrugh, and especially William Congreve. Thereafter, except for brief intervals, as in the plays of Goldsmith and Sheridan and the drama of our own day, the acted drama has not formed an important section of English literature, although almost every poet, Addison, Thomson, Gray, Wordsworth, Coleridge, Byron, Shelley, etc., has tried his hand at poetic drama, Elizabethan or classical.

#### Development of English Prose

The same idea of uniformity, of a definite but not too rigid pattern, "correctness," shaped the prose of Dryden, Temple, and their followers. The earlier prose of the 17th century had shared in the irregular greatness of the poetry. The prose of Francis Bacon's *Essays*, and *History of Henry VII*; of the great Anglican preachers, Lancelot Andrewes, John Donne, poet in prose as well as verse, Jeremy Taylor, of philosophical humorists as Robert Burton, *The Anatomy of Melancholy*, Thomas Browne, *Religio Medici*, and *Urn Burial*; the controversial pamphlets of Milton, as *Areopagitica*; the historical memoir-writing of Clarendon, *History of the Rebellion*—all illustrate the erudite, imaginative phraseology, the splendid but not perfectly controlled harmony, the too long and complex sentence-structure of a prose which enriched our language, but was not a fully developed and controlled medium.

A simpler style is traceable in the antithetic sentences of the character-writers, as Earle's *Microcosmographie*; the prose of moderate divines like Chillingworth, *The Religion of Protestants*, and Hales, *Golden Remains*; and the virile, well-girt style of the philosopher Hobbes, *Leviathan*. The strain of racy colloquialism in 17th century prose, coloured by a sensitive and imaginative temperament, and enriched by the sublimer phraseology of the English Bible, gives individuality to the *Grace Abounding* to the Chief of Sinners and *Pilgrim's Progress* of John Bunyan. A gentler temper sweetens the talkative prose of Izaak Walton's *Compleat Angler*, and *Lives*, and the multifarious, witty writings of Thomas Fuller. The new prose, colloquial but urbane and weighty, begins in the *Sermons of Tillotson* and South, the *Essays of Sir William Temple*, and, above all, in the prefaces and essays of John Dryden, whose

critical prefaces manifest, for the first time, the qualities of urbanity, of ease and elegance combined with force, which mark the prose of a people who have come of age socially and culturally.

The new instrument lent itself to all the purposes of an age in which political and social life entered into the closest union with literature. The first of these is satire; and the pamphlets and occasional pieces of Jonathan Swift, from *The Tale of a Tub* to the *Travels* by Lemuel Gulliver, made him a power in English political life, and revealed the greatest mastery of irony in the English or perhaps any other tongue. Richard Steele and Joseph Addison, pamphleteers on the other side from Swift, showed in *The Tatler* and *The Spectator* how the same style, used with less masculine vigour than in Dryden's, and less incisive virulence than in Swift's prose, but with a delightful blend of irony and "sweet reasonableness," might be made to inculcate good sense and purer manners on a society which still felt the evil effects of Puritan and Restoration excesses. *The Tatler* and *The Spectator* had many successors down to the end of the century, including *The Guardian* and Johnson's *Rambler* and *Idler*.

#### Birth of the Modern Novel

The first of modern novels in Western Europe was Cervantes' *Don Quixote*, whose fame was quickly diffused. The most interesting precursors of the novel in English were such varied products as the picaresque and sentimental extravagances of Aphra Behn's *Oroonoko* and *The Forced Marriage*; Bunyan's realistic allegories; Daniel Defoe's stories, which are almost the complete thing, e.g. *Robinson Crusoe*, *Captain Singleton*, *Moll Flanders*, *Captain Jack*; and the fantastic realism of Jonathan Swift's *Gulliver's Travels*. But a potent shaping influence was that of the press, which, beginning in the reign of James I, had developed in the *News Books*, *Mercuries*, etc., of the Civil Wars, the last phase of which was the *Newsletters* of Henry Muddiman and the fuller journalistic work of John Dunton and Daniel Defoe.

The man in whose work these various elements—realistic narrative, the minute portrayal of contemporary life and manners, the didactic interest in conduct—crystallised, finding their centre in the sympathetic analysis of a human soul passing through a moral crisis, was Samuel Richardson, whose *Pamela*, *Clarissa*, and *Sir Charles Grandison* created a type of novel

which has been more assiduously cultivated in France than in England. A different kind of plot, deriving from *Don Quixote*, full of adventures at inns, bringing together all sorts and conditions of men, a more masculine philosophy of life and conduct, made Henry Fielding, dramatist, essayist, and novelist, the father of a novel more characteristically English than that of Richardson. Joseph Andrews, *Jonathan Wild*, *Tom Jones*, and *Amelia* are the most genial and vivid pictures of English life which the 18th century has bequeathed.

#### Smollett and Goldsmith

He was followed by an ill-conditioned Scot of genius, Tobias Smollett, a sardonic and angry painter of sordid and violent life, the creator of some immortal types, as of the English sailor, in *Roderick Random*, *Peregrine Pickle*, and *Humphrey Clinker*. The tendency of the novel in Smollett's hands to revert to picaresque story was checked by Laurence Sterne, whose self-conscious sentiment and whimsical humour, which owed much to Rabelais, Montaigne, Cervantes, Burton, and Swift, found expression in *The Life and Opinions of Tristram Shandy, Gent.*, and the *Sentimental Journey*, a tour through France and Italy, tales which, following no plan, vindicated the right of the novel to take what form it please, so it mirror the idiosyncrasies of character and feeling. Among the followers of these great painters of manners is Frances Burney, with *Evelina*, *Cecilia*, and *Camilla*, while Johnson's *Rasselas* is but an expanded epilogue of the type of Addison's *Vision of Mirza*. Goldsmith's *The Vicar of Wakefield*, with its fanciful, humorous, pathetic picture of life seen through the idealising atmosphere of reminiscence, had an influence on Goethe and Continental writers hardly inferior to that of Richardson. In Horace Walpole's *Castle of Otranto* the first wave of the Gothic revival reached the novel.

The novel was only one channel of prose literature in the century. If the didactic spirit invaded and chilled poetry, the regard for form, for correctness, elegance and dignity of composition, gave artistic interest to work of kinds which a later age has too scrupulously divorced from literature. John Locke, *Essay concerning Human Understanding*, was a diffuse and cumbersome writer; but there are few finer practitioners in the prose of Dryden and Addison than George Berkeley, *Three Dialogues*, Alciphron, and David Hume, *Essays*. Johnson, poet, lexicographer, essayist, and critic, sacrificed the

lightness of Addisonian style for more force and dignity, not untouched with pomposity, qualities not more evident in his own work than in the record of his conversation preserved in James Boswell's *immortal Life*.

English prose acquires grace and charm in the work of Oliver Goldsmith, whose *Citizen of the World*, *Vicar of Wakefield*, and comedies have an unfading freshness. Edward Gibbon made the same dignified prose the purple vestment of his not more learned than splendidly ordered *Decline and Fall of the Roman Empire*. Edmund Burke, the most diffuse and gorgeous of English orators, combined with eloquence a unique intellectual and imaginative insight into the principles of politics, the mainsprings of man's social nature.

A didactic purpose, a regard for "correctness" within a narrow but widening pattern of diction and verse, are the accepted principles of English poetry to the time of Blake and Wordsworth, and even later. The beginnings of a change showed themselves first rather in an enlarged choice of subjects—Nature, the Middle Ages, Liberty, and the Natural as opposed to Civilized Man, and in some experiments in earlier verse forms, than in any radical change of spirit and style.

#### Augustan Conventions

James Thomson's blank-verse *Seasons*; John Dyer's octosyllabic *Granger Hill*; the essays in Spenserians, as Thomson's *Castle of Indolence*; Thomas Gray's pensive *Ode on a Distant Prospect of Eton College*, or *Elegy in a Country Churchyard*; and the equally pensive, less finished and sustained, but more spontaneous and sensitive odes of William Collins; the minor poetry of the Wartons, Thomas and Joseph, and of Mark Akenside; the poems, more Pope-like in form, of Dr. Johnson, as *The Vanity of Human Wishes*; Oliver Goldsmith's *The Deserted Village*, and George Crabbe's *The Village*, all show in different ways the change that is being effected, but are still quite Augustan in their conventional "poetic diction," their studied "correctness" in spirit and form; and so, despite their romantic themes, are Gray's more ambitious odes, *The Progress of Poesy* and *The Bard*.

But the new spirit was to find its proper style, to substitute for a poetic heightening of eloquence a style whose ideal is the free and natural outpouring of the heart. The frost is loosening in the poetic prose of Macpherson's *Ossian*, and

Chatterton's Rowley Poems, in Goldsmith, and in Cowper's *The Task*. It is broken up in the songs of William Blake, mystical poet and painter, Songs of Innocence, Songs of Experience, and in the Lyrical Ballads of Wordsworth and Coleridge.

The long poetical career of William Wordsworth was run in the fervour of imaginative and mystical insight into the life of nature and its significance for the soul of man, to which he had attained through the meditative country life of his youth and the spiritual agitations of the French Revolution. The *Prelude*, the *Excursion*, *The Recluse*, fragments of a never-completed autobiography and spiritual creed in blank verse; lyrical and narrative poems inspired by nature, childhood, the peasant, the affections, patriotic sonnets, have one common theme, and are composed in a style which Wordsworth was disposed to make something of a religion too—bald and prosaic and even awkwardly pompous when inspiration fails, at its best unique in passionate, imaginative simplicity. Coleridge's best poetry shows the influence of Wordsworth in thought and feeling and style, but what is most individual in *The Ancient Mariner*, *Christabel*, *Kubla Khan*, is not these Wordsworthian qualities, but the magic with which the reawakened sense of beauty and mystery is expressed in phrase and in subtle music of vowel and consonant and cadence.

#### Poetry of Scott and Byron

The spirit and art of Wordsworth's and Coleridge's poetry were too novel and elusive for immediate appreciation. Public taste had to be stimulated and purged by the more crudely romantic poetry of Walter Scott, Byron, and Thomas Moore. Scott's stirring but somewhat rococo lays are of less pure poetic worth than the delightful snatches of song in which he revived the impersonal, chivalrous note of medieval lyric. The fiery, brilliant, crude improvisations of Byron in lyric and lay, and the blend of description and rhapsody in *Childe Harold* are the unreflective, potent expression of the spirit of pure revolt in romanticism, but Byron's best work was satire in conversational style and *otava rima*, *Beppo*, *Don Juan*, and *The Vision of Judgment*.

Scott and Byron enjoyed a European reputation. They are the most human and worldly of the poets of the period: there is more passionate flesh and blood in Byron's technically inferior work than in the work of any of our poets

save Shakespeare and Burns. The "desire of the moth for the star" is the burden of the lyrical dramas, *Prometheus Unbound* and *Hellas*, rhapsodies as *Alastor*, and elegiac poems as *Adonais*, and the songs in winged and ethereal rhythms of Percy Bysshe Shelley. Beauty, the beauties of nature, of Spenser's poems, of medieval chivalry, of Greek mythology and art, of Miltonic cadences and Shakespearean phrases, are the theme and inspiration of the *Endymion* and later poems and odes of John Keats. The curiously carved Gebir, *Hellenics* and *Lyrics* of Walter Savage Landor are inspired by a like sense of the statuesque beauties of Greek poems and epigrams and by a finer scholarship, if a less spontaneous creative genius.

#### The Revolutionary Novel

The last great novelist in the 18th century school of manners and character was Jane Austen, whose *Northanger Abbey* was an early skit on the new romantic novel. Her exquisite pictures of genteel English life in the country and at Bath include *Pride and Prejudice*, *Emma*, and *Persuasion*. But the novel, too, came under the influence of the taste for romantic scenery, a medieval atmosphere, the marvellous and mysterious, dreams of the perfectibility of human nature and political regeneration. The result is seen in revolutionary novels as William Godwin's *Caleb Williams*; didactic stories like Thomas Day's *Sandford and Merton* and Miss Edgeworth's tales; Mrs. Radcliffe's tales of mysterious adventures, *The Mysteries of Udolpho*; crude experiments in historical fiction as Longworth, Earl of Salisbury, Clare Reeve's *The Old English Baron*, Jane Porter's *The Scottish Chiefs*, Maria Edgeworth's *Castle Rackrent* and other tales extended the study of manners to the Irish gentry and peasants.

These and the historical stories are interesting now only or mainly as marshalling the way to the great achievement in the *Waverley Novels*, from *Waverley* to Count Robert of Paris, of Sir Walter Scott, who combined and harmonised the interest in character and manners of the great 18th century novelists, the romantic passion for other times and other manners and for a picturesque setting in scenery rich in historical associations, and that respect and affection for the peasantry which had grown steadily throughout the 18th century from Thomson and Gray to Rousseau and Burns and Wordsworth.

The influence of the romantic

movement on prose work other than the novel can be studied in the picturesque, archaically coloured prose essays and Elizabethan critical studies of Charles Lamb, *Essays of Elia*, *Specimens from the Dramatic Poets*; in the vivid, passionate, impressionistic essays and criticism of William Hazlitt, *Lectures on the English Poets*, *Lectures on the English Comic Writers*; in the cadenced prose, musical and fanciful, of Thomas De Quincey, *The Confessions of an Opium Eater*; and in the pleasant chat about letters and art and scenery of Leigh Hunt, *The Examiner*, etc. William Cobbett's racy, idiomatic prose, *Rural Rides*, continues the tradition of South and Swift.

The poetry of the reign of Queen Victoria is a continuation and elaboration of the romantic revival. The chief themes are the same—Nature, the romantic past, medieval and classical, the problems of life and death. There is less of the suggestion of a prophetic burden (that is taken over by prose writers like Carlyle and Ruskin) than in Wordsworth and Shelley, more of consciously artistic handling, of antiquarian accuracy of reproduction, of analysis and inquiry, of dramatic interest which, except in Scott, had been somewhat overshadowed by the large topics—Nature and Liberty and Romance. The purification of style, the rejection of a stereotyped convention in poetic diction, had led to an enrichment of phraseology, a more imaginative style that owes much to older poets, and in the elaboration of which Keats is a principal agent, and Keats's influence is obvious in all the Victorians.

#### Tennyson and Browning

The most representative poet is Alfred Tennyson, whose careful experiments in the artistic expression of moods culminated in the two volumes of 1842, lyrics and idylls of nature and English rural life, of character, *Simon Stylites* and *Ulysses*, of medieval and classical legend, and of the problems of sin and death and immortality, *The Vision of Sin*. In the years which followed the style thus studied and mastered became the medium of longer, more ambitious, not always entirely successful poems, *The Princess*, *In Memoriam*, *Idylls of the King*, jewelled settings of tales from Malory and the *Mabinogion*, touched with modern feeling. Tennyson's later ballads and idylls reflect with great but unequal power his passionate patriotism and the trouble of soul with which he contemplated the changing spirit of his age.

A wider dramatic range, a more curiously analytic mind, a more colloquial style, and a less melodious but more varied verse distinguish the not essentially different dramatic monologues and lyrics of Robert Browning. The long and somewhat chaotic and obscure poems, of which the happiest is Paracelsus, were followed by experiments in dramas intended to be acted (as some were), and then Browning found himself in a series of shorter dramatic lyrics and monologues, beginning with Pippa Passes and closing with Dramatis Personae. The longest of his dramatic, analytic studies of the human soul, *The Ring and the Book*, was followed by many similar studies, subtly intellectual but more fitfully inspired.

As a revival of the life and art and spirit of past times the movement which began in the 18th century culminated in the exotic, cultured poetry of the middle of the 19th century. But this poetry also reflects that change of spiritual temper which troubled Tennyson and Browning, on the one hand the revival, actual or artistic, of medieval Catholicism, on the other the Lucretian philosophy of life to which modern science tended.

#### Learning and Lyrical Inspiration

In this philosophy, in the poetry of Greece, in Goethe and Wordsworth, Matthew Arnold found the inspiration of poems, lyrical, narrative, and in Greek dramatic form, with a piercing elegiac note of their own. Medieval art, early Italian poetry, Keats and Browning were the influences which shaped and coloured the ballads, monologues, sonnets, and lyrics, sensuous, mystical, and elaborate, of Dante Gabriel Rossetti. Early French poetry, Froissart and Chaucer, Rossetti and Browning, the architecture and decorative arts of the 12th and 13th centuries, the passionate, stoical heroism of Icelandic myth and saga, a socialism which is in part an artist's hatred of modern machinery and commerce, are the blended strains in the lyrical and narrative poetry and prose of William Morris, reteller of stories classical and northern after the manner of Chaucer, but without his humour.

A deeper sympathetic comprehension of the spirit, but even more of the form, the metrical complexities and beauties, of Greek poetry, superior to that of Gray, perhaps even of Milton, for Milton was limited by the scholarship, more Latin than Greek, of his day; an equally intimate know-

ledge and understanding of French poetry from Villon to Victor Hugo; a love amounting to idolatry for Shakespeare and the Elizabethan dramatists—are the sources of the poetry, decorative and intoxicatingly harmonious, of Algernon Charles Swinburne. Never have learning and lyrical inspiration been more strangely blended; never has poetry so spontaneously lyrical been so purely literary in its sources and motives.

#### Old Forms and Modern Feeling

To this school belongs the intimate, ascetic, religious poetry of Christina Rossetti; and one of the most remarkable products of the tendency to find inspiration in the past and adapt old forms to modern feeling is Edward Fitzgerald's Rubaiyat of Omar Khayyam. There is no room here to speak of lesser work, as Keble's *The Christian Year*, the *Lays of Lord Macaulay*, the *Festus* of Bailey, the poetry of Taylor, Alexander Smith, Sidney Dobell, and Arthur O'Shaughnessy, or the lighter verse of William Edmondstoune Aytoun, C. S. Calverley, and Lewis Carroll.

Among the many prose writers other than novelists of the early and middle century, historians like George Grote, *History of Greece*; Lord Macaulay, *Essays, History of England*; James Anthony Froude, *History of England*; philosophers as John Stuart Mill, *Logic, On Liberty, Utilitarianism*; and Herbert Spencer, *Principles of Psychology, First Principles*; theologians and religious writers as John Henry Newman, *Apologia pro Vita Sua, Grammar of Assent*; critics of literature and art as Matthew Arnold, *Essays on Criticism*; and Walter Pater, *Studies in the History of the Renaissance*, Marius the Epicurean, *Appreciations*, two stand out most vividly. The first is Thomas Carlyle, the tormented, passionate, eloquent prophet of duty and work, whose Sartor Resartus is at once a spiritual autobiography and a philosophy, following Swift and Burke, of the clothes, political and religious, in which the human spirit is ever concealing its "shivering nakedness," only to find them grow old and drop away, if not burnt up in Protestant Reformations and French Revolutions, and to begin again to weave them in time's tireless loom.

In the French Revolution Carlyle portrayed, with an amazing vividness of dramatic and cinematographic presentation, an era of dissolution and rebirth, the flaming apparition of modern democracy.

In *Heroes and Hero-worship*, *Cromwell's Letters and Speeches*, and *History of Frederick II*, he dilated upon and dramatically reconstructed some of those great spirits who, penetrating to the reality which underlies the illusions of life, are the true leaders of men.

The reference to current events which runs through all his work found clearest expression in *Chartism Past and Present*, and *Latter Day Pamphlets*. The other Victorian prophet is John Ruskin, the more musically eloquent expounder of art, painting and architecture, in its relation to the moral nature of man and the ordering of society. Modern Painters, *Seven Lamps of Architecture*, *Stones of Venice*, *Unto this Last*, *Sesame and Lilies*, *Fors Clavigera*, *Preterita* are among the principal works which brought art into a closer relation with literature than had ever been done before in England, and trace the troubled progress of a great and sensitive soul. A less prophetic but equally prejudiced and individual writer of the period was George Borrow, the first interpreter of the Gipsy character, and a writer of natural, racy prose, *Lavengro*, and *The Romany Rye*.

#### Dickens and Thackeray

The Victorian novel resumed with certain definite limitations imposed upon it by the moral taste of the time, the work of the great 18th century novel, the serious and humorous portrayal and the active criticism of contemporary life and manners, with occasional digressions into the historical. Charles Dickens, humorist, sentimentalist, pictorial describer and dramatic, not to say melodramatic, narrator, social critic and reformer, began with *The Pickwick Papers* a series of novels and tales that enthralled the readers of the world. The greatest are probably *Pickwick*, *Nicholas Nickleby*, *Martin Chuzzlewit*, *David Copperfield*, and *Great Expectations*. *Barnaby Rudge* and *A Tale of Two Cities* are historical novels, the latter coloured by the reading of Carlyle's *French Revolution*. Dickens's favourite subject was the character and manners of the lower middle classes.

But the most penetrating critic of the devastating snobbishness of English upper class society, never worse than at this time, when wealthy merchants were pressing for aristocratic recognition, was William Makepeace Thackeray, the most unerring portrayer since Fielding of human nature as it is.

the novelist who gives us no heroes. *Vanity Fair*, *Pendennis*, and *The Newcomes* are, with his shorter sketches, the greatest of his novels of contemporary life. In *Esmond*, and in a lesser degree in its sequel *The Virginians*, the same delicacy of satirical and sympathetic portraiture is given an historical setting of wonderful comprehensiveness and atmosphere. The early sketches of provincial life by George Eliot (*Marian Evans*), *Scenes from Clerical Life*, *Adam Bede*, *The Mill on the Floss*, *Silas Marner*, and *Felix Holt*, have a freshness and power that somewhat failed her in the later more learned and philosophical works, *Romola*, *Daniel Deronda*.

#### Propaganda through the Novel

The tendency to make of the novel a political, social, or ethical and religious pamphlet, which is obvious in Dickens's works, though constantly transcended by his buoyant humour and creative power, is dominant in the brilliant political novels of Benjamin Disraeli, *Coningsby*, *Sybil*, *Tancred, Lothair*, and *Endymion*; in the ardent and vivid pictures of contemporary and past problems and agitations of Charles Kingsley, *Alton Locke*, *Hyppatia*, *Westward Ho!*, and *Hereward*; and in the stories of Mrs. Gaskell. *The Bror tésisters*, *Charlotte and Emily*, poured into the same form, *Jane Eyre*, *Villette*, *Wuthering Heights*, the lyrical record of their own lives and passionate thoughts. Anthony Trollope, with his delightful sketches of clerical society, *Barchester Towers*, *Framley Parsonage*; Charles Reade, ardent social reformer, *It Is Never Too Late to Mend*, *The Cloister and the Hearth*; and Lord Lytton, experimenter in all kinds of novels, *The Caxtons*, *My Novel*, *The Last Days of Pompeii*, *A Strange Story*, are typical Victorian novelists.

#### H. J. C. Grierson

Literature constantly renews itself, or it would not be literature, and a renewal began in the 1870s. Poets and novelists betrayed a certain restlessness, as if their genius needed fresh air. George Meredith (1828-1909), having studied German transcendentalism, brought this philosophy into his best work. There is something cosmic in his poems, which celebrate the spirit of life pervading the whole creation. If man ignores this unanimism, he does so at his peril. Such was the burden of his novels, which present one or more human beings insensible to these influences, absorbed in their own social or sentimental prejudices and thereby lost

to that saving sense of humour which Meredith defined as "intellectual laughter" (*Beauchamp's Career*, 1876; *The Egoist*, 1879; *Diana of the Crossways*, 1885).

Thomas Hardy (1840-1928) knew nothing about people who use their wits to push their way, but everything about the humble folk who pursued their immemorial callings in "Wessex." These simple characters were not the types to create a plot; the plot had to create them; that is to say, he had to manoeuvre them into the kind of situations which give his well-constructed novels their atmosphere of suspense and pathos. So they became figures of high drama, the victims, not of the "tragic error," but of the "tragic fluke." This sombre and ironical interpretation suited his temperament, already burdened with Darwinism, but darkened his artistic consciousness. Nevertheless, his best novels (*The Return of the Native*, 1878; *The Woodlanders*, 1887; *Tess*, 1891), redolent of Old England, breathe a rustic atmosphere such as only a poet could create. His eleven volumes of verse (from 1898) are unmistakably individual and intimate, the tone either ironical or meditative, the thought slimmed down to the least ornamental expression. *The Dynasts* (1904-08) is still the same Hardy seen against an epic background.

R. L. Stevenson (1850-94) believed that the charm of literature survived in its form and style, not in its content. He cultivated a freshness and grace which transfigure the most ordinary subjects. He began with essays and sketches (*Travels with a Donkey*, 1879), until he discovered that he could write tales of adventure, and that thereby he could liquidate the obsessions of his Calvinistic training—his horror of evil—picturing the folly of wickedness and the wickedness of folly in dramatic and spirited narratives, touched with humour as well as psychological insight (*The Master of Ballantrae*, 1889; *Weir of Hermiston*, 1906).

#### Late Traditionalists

Oscar Wilde (1856-1900) was more outspoken and provocative. He appealed to his generation to stop making money out of others and begin making a work of art out of themselves. This was the basis of the "aesthetic movement" which Wilde expounded in his essays. In his comedies (*Lady Windermere's Fan*, 1892; *The Importance of Being Earnest*, 1895) he represented (not caricatured)

those who had the leisure but lacked the brains to be aesthetes.

These authors were ready enough to break with puritans and philistines, but not to break with tradition. The same is true of a group who aimed at discrediting the laxity of current speech. Charles Doughty (1843-1926) gave them the lead (*Arabia Deserta*, 1888; *Epic Poems*, 1906-20); but the outstanding figure is Robert Bridges (1844-1930). It was his life work to give wider and deeper scope to English humanism, as he reaffirmed in *The Testament of Beauty* (1929), a long didactic poem, compact of scholarship and philosophy. Gerard Manley Hopkins (1844-89) went even further. He readapted the old arts of stress, sprung rhythm, inscape, and archaic phraseology till they became a technique peculiar to himself wherewith to suggest a height of religious ecstasy or a depth of despair, attempted only by Dante. Lancelles Abercrombie (1881-1938) is akin to this group. He was somewhat a mystic, gifted with a keenly sensitive ear and a discerning sympathy with human nature, over-anxious to borrow the spirit and persuasiveness of the 17th century.

#### Kipling the Many-sided

Strange as it may sound, the archaic school had much in common with Rudyard Kipling (1865-1936). This dogmatic and impulsive writer has been frequently misjudged because of his many-sidedness. Born and bred (though not educated) in the ancient civilization of India, he was sensitive to supernatural influences, a primitive at heart. Being an acute observer, and an inveterate globe-trotter, he studied the significance of mechanised civilization at first hand and was astonished at the inventive adventurous spirit of man renewing itself in wondrous and godless ways, forgetful of eternal law. Nations as well as individuals were being subjected to a crucial test. It was only human that he should believe that imperial England was the divinely appointed pioneer and moderator. So he started his series of ballads, verse monologues, and picturesque prose tales, employing the old swinging metres, the old objective narrative manner, and the old diction, except where dialects and colloquialisms could appropriately be introduced, again after the fashion of pre-Renaissance authors. His vigorous racy style has a tang of its own, yet his convictions remind us of the Bible and of Bunyan.

Moreover, throughout his life he cherished a nostalgic sympathy with the older more permanent issues, for instance boyhood, the charm of animals, folklore, the mother-wit, fortitude and folly of the primordial adventurer (*Jungle Books*, 1894-95; *Captains Courageous*, 1897; *Kim*, 1901).

John Masefield (b. 1878) was much influenced by Kipling. He had a similar aptitude for the country scene, and zest in the spectacle of human energy and, like his master, imposed these qualities on unpoetical themes, adapting his vocabulary to his characters with the utmost freedom (*The Everlasting Mercy*, 1911). But at heart he was a conventionalist, and, having established his artistic independence, he reverted to the manner of Chaucer, and was at his best portraying English pursuits and pastimes "in places where the will to live clothes itself in lovely shapes."

#### Neo-Georgian School of Poetry

There were other poets who avoided both the archaic and the Kiplingesque schools, because the one made poetry too difficult and the other made it too easy. These—the so-called neo-Georgians—contented themselves with the simplest pleasures, enjoyed in the most natural ways, relieved of Victorian luxuriance and sentiment. The most representative of these are Rupert Brooke (1887-1915), who achieved the right note of intimacy and contentment, and James Elroy Flecker (1884-1915), who modelled his technique on the clarity and compactness of the Parnassians.

The neo-Georgians, as a whole, produced little effect because they made no discoveries. They expressed only themselves. They might have learnt much from Walter De La Mare (b. 1873), who began by writing prose and verse in the vein of childhood, and then disciplined his imagination to range over the mysteries haunting the consciousness of adults. In his novels (*The Return*, 1910; *The Memoirs of a Midget*, 1921), he poses a whimsical situation which develops into an allegory of human experience. His mature verse, at its best, is steeped in melancholy, now and then illuminated by touches of exquisite beauty.

At this turning point in English history, it is remarkable that the vast majority of authors practised fiction. They had the example and authority, first, of Henry James (1843-1916), who taught himself how to concentrate on the one outstanding character and organize his

personality, bit by bit, till the reader gradually perceives its mainspring—some idea or ideology which makes him what he is; second, of George Moore (1852-1933), who began as a realist and ended as the re-creator of realism, projecting his own knowledge of life into some historical personage and readjusting the facts so as to express his artistic sense of composition, rhythm, fitness and human dignity. Arnold Bennett (1867-1931) would gladly have learnt their lesson. He aimed at truth to life, provided that the author was also true to himself. Between 1908 (when his masterpiece *The Old Wives' Tale* appeared) and 1916, he was inspired to draw his material from the drab, industrialised society of the Five Towns. These reminiscences, being part of himself, gave scope to his genius. His other 60-70 publications, except *Riceyman Steps* (1923), can hardly be classed as serious literature.

The career of John Galsworthy (1867-1933) is not dissimilar. In his first masterpiece (*The Man of Property*, 1906) he relived his own ten years of "ecstasy and torture," transposed into the impersonal, objective realm of art. Having purged his own soul, he had eyes to see how others, in fact his whole class, were confined to a gilded prison, frozen in prosperity. Hence his next three novels and his three remarkable plays (*The Silver Box*, 1906; *Strife*, 1909; *Justice*, 1910) which reveal the injustices of English plutocratic democracy, and the dramatic possibilities of undramatic facts. The popularity of *The Forsyte Saga*, 1922 was immense and immediate. He also produced 17 more plays, of which *The Eldest Son* (1917) and *The Skin Game* (1920) are the most convincing. But none of his works after the *First Great War* is written with his blood. They have only the humour and humanity of a man whose battle is won.

#### Conrad's Dramatic Sea Stories

Joseph Conrad (1857-1924), who knew no English till he came of age, scorned the conventional topics of British fiction. Relying on his study of Russian and French novelists and 20 years of cosmopolitan sea-travels, he dived into his own heart, and put what he found into the heart of some figure glimpsed in passing, years ago, and remembered because suggestive. Acting on a hint, he recreated the impression, till it grew into a drama of perseverance and perversity. In this

spirit he produced some austere yet vivid masterpieces (*The Nigger of the Narcissus*, 1898; *Lord Jim*, 1900; *Typhoon*, 1902).

E. M. Forster (b. 1879) might be considered Conrad's exact opposite, except that he is an equally conscientious artist, no less alive to the influence of atmosphere. He is chiefly interested in the normal educated human being who adjusts his conduct to the moral and social environment, but also has (or ought to have) a soul accountable to no one, not even to himself. As such evenly balanced temperaments are rare, Forster became an expert in portraying those who unsuspectingly miss their place, either in society or in their own hearts; and he enjoyed manoeuvring them into cleverly contrived embarrassments and inconsistencies. Generally he developed his comedy and criticism out of studies in the routine of English middle-class life (of which *Howard's End*, 1910, is the best); but curiously enough his first and latest important works (*Where Angels Fear to Tread*, 1905; *A Passage to India*, 1924) dissect human nature on a background of racial and international misunderstandings. As he tells his stories in the old objective manner, without explanation, many a reader is unprepared for their spiritual implications. No one is likely to undervalue their classic style.

#### Walpole and Wells

His quality becomes apparent when he is compared with Sir Hugh Walpole (1884-1941), who also wrote in the accepted Victorian manner, and understood as well as Forster did that every human being worth a novel has to live down his past or conquer his future. Walpole began well, but this tension gradually took such hold of his imagination that he came to depict, or even personify, evil as a malignant force, often looking for it where it could not be found. This satanism vitiates even his best sustained effort, *The Herries Chronicle* (1930-33).

H. G. Wells (1866-1946), on the other hand, began simply by trying to interest others in what interested him. Hence arose his series of scientific yarns, admirable in their inventiveness and touches of humour. He soon perceived that these extravagant romances might sooner or later become alarming realities, for which people were quite unprepared. Hence his stories on social, educational and administrative problems, of which

Kipps (1905) and *The History of Mr. Polly* (1910) are the least ambitious and the most enduring. Having exposed, according to his view, the apathy and muddle-headedness of Edwardian England, he had the courage and confidence to offer the remedy in his discursive and brightly written essays in the reconstruction of knowledge in order to reconstruct civilization. In his later works he was obsessed by the crisis in human affairs.

W. Somerset Maugham (b. 1874) is another story-teller who seasoned the ancient art with contemporary ingredients. But while Wells tried to reform his contemporaries, Maugham tried to reform the way of looking at them. Science interprets, art and philosophy reinterpret. He did not, however, fully master this principle until he applied it to his own life in the disguised autobiography *Of Human Bondage* (1915). His narratives move rapidly and unexpectedly, and he uses his subsidiary characters to reflect the surprises he springs on his readers. This dramatic concentration is all the more effective because Maugham is also an accomplished playwright, skilled in the mass-psychology of the theatre.

#### Recrudescence of Drama

The recrudescence of the drama, inaugurated in the late 'eighties by Pinero, Hankin, Davies, H. A. Jones, and Wilde, influenced by Ibsen, G. Craig, and the Irish National Theatre Society, during the 20th century drew into its practice novelists and poets of note, as well as a group of professional dramatists, including Stanley Houghton, Harley Granville-Barker, St. John Ervine, Lord Dunsany. By far the most prolific and technically expert was Sir James Barrie. But all were overshadowed by Bernard Shaw (b. 1856). Shaw believed so wholeheartedly in the perfectibility of man that he believed man could perfect himself simply by sharing the good things of this world, including its poetry and music. Since this rectification could be attained only through Fabian socialism, and since anti-socialism was muddle-headedness or class-prejudice, the obstructionists had only to be presented before the footlights and they would soon laugh themselves out of court. He quickly learnt that stage socialism connoted or denoted other kindred demands on clear-headedness. Accordingly he widened his scope. At the back of his comedies there emerges what he regarded as some

economic, religious, or sentimental fallacy, and in the foreground its adherents and dissidents think aloud. All are contemporary types (even the historical characters), with just enough actuality to persuade an audience that it is listening to its own opinions. His first masterpiece is *Candida* (1895), but he did not become popular till *John Bull's Other Island* (1904). Thereafter his plots became less continuous and more speculative, but he returned to his best manner in *The Doctor's Dilemma* (1906), *Androcles and the Lion* (1912), and *Saint Joan* (1923). Shaw is an expert in human contrasts and incongruities, and has at times an audaciously felicitous sense of stage effects. He did much to abolish what he called "footlight sensations" and to inspire a new school of acting. To appreciate Shaw fully it is, of course, necessary to read his prefaces, written in English of an uncommon lucidity, as well as the plays themselves.

#### Poets of the First Great War

The First Great War brought a new orientation, most clearly revealed, as always, in poetry. The war poets began with an outburst of lyrical and patriotic fervour (Charles Sorley, Julian Grenfell), but soon changed their tone to outspoken disillusionment and bitterness (Wilfred Owen, Siegfried Sassoon). They wrote, for the most part, in the old manner, but with a new licence of speech. Others of the younger generation felt that poetry should be a sheer effort of creative energy which fulfilled itself in the ardour of composition, personal and spontaneous, the words extemporising the thoughts. Therefore if the imagination was to enjoy the freedom of a dream, the prosody must be free also, not confined to the discipline of metre. The spirit should find vent in cadences which rose and fell with the flow of words, as in emotional prose. This cult became the recognized technique for many who wanted to leave the shattered world behind and start afresh, beginning with the experience of themselves.

There was much to encourage their spontaneity, which ended in iconoclasm. Study of anthropology and folk-lore had demonstrated that man is the legatee of a very ancient inheritance still potent in his racial memories and primitive susceptibility to seasonal and astral influences, and the call of sex. Twentieth century scientists disclaimed Victorian certitudes, hinting that man resists the

vagaries of evolution and follows appetencies which are all his own. Sigmund Freud (1856-1939) developed the theory that man lives two lives within himself, one an intellectual superstructure, the other a dark subterranean stream, perhaps prehuman in origin, which pervades his senses, creeping upwards into his dreams and affecting his sexual affinities. If all this is so, the artist cannot truthfully portray human nature until he has explored this interplay. Hence the "internal monologue" between the conscious and subconscious selves running concurrently through the same brain.

These ideas came as a revelation and a release to the more restless and inquisitive spirits of the time. D. H. Lawrence (1885-1930), bent on self-realization, plunged almost blatantly into the mysteries of sex attraction and the acquired relationships which unsettle the current of human existence (*Sons and Lovers*, 1913), persuading himself that man is not complete until he sinks his spirit in the "mindless creative stir of universal nature," the "otherness" which fuses yet rescues his soul (*The Rainbow*, 1915). These disturbing novels have narrative power, and his sense of atmosphere is unique. His later cosmopolitan novels are filled with wild, grandiose scenery, and a penetrating curiosity in the course of civilization far from Europe (*The Kangaroo*, 1923; *The Plumed Serpent*, 1926). He has written fascinating travel-books and much rhythmic unmetrical verse, for which he justly claims "the insurgent naked throb of the instant moment."

#### Joyce's Use of "Internal Monologue"

The revelation which Lawrence sought in the instincts and impulses of the blood stream and ganglia, James Joyce (1882-1941) sought in unspoken speech which expresses the germs of thought and feeling as inconsequentially as they enter the brain. Language was the indispensable and peculiar implement of the human *psyche*, which by its mere functioning betrays the ferment and confusion underlying conscious utterances. Moreover, this functioning, like any other mechanism, obeys its own universal laws. So what is true of one human being is true of all others, in principle. If it were possible to accompany a single specimen in his ruminations through the round of a single day the secrets of the human process would be revealed; yes, even of Homer's Ulysses. So the author of

The Portrait of the Artist as a Young Man (1916) eventually published *Ulysses* (1922), the most elaborate and erudite demonstration of what the internal monologue can achieve.

Virginia Woolf (1882-1941) must have been influenced by Bergson and Proust, as well as by Joyce. Her characters are made to dream or ruminate in such a way that their past survives in their present stream of consciousness, and their moods are deeply coloured by their spiritual and social contacts. Her novels are remarkable each for its invisible unity as well as its clairvoyance. This subtle effect was achieved by a life-long process of trial and error, easily traceable in Mrs. Dalloway (1925), *To The Lighthouse* (1927), *The Waves* (1931). Her style has a rhythm and sensitivity which are peculiarly her own.

#### Technique of Shock

Other writers felt so keenly the lack of spiritual sympathy and inwardness among their readers that they made their appeal through the senses and sensibilities, cultivating a technique which should produce a shock of surprise, and sting their blurred perceptiveness to life; for instance, Edith Sitwell (b. 1887), the most gifted English poetess of her time, for years relied on "sense-transfusion" (or "confusion"), the power of open vowels, verbal music, and recurrent phrasing. Her two brothers, Sir Osbert (b. 1892) and Sacheverell (b. 1897), in their cosmopolitan essays and travel books dwelt on surviving relics of beauty and strangeness. Yet others were so convinced of the prevalence of evil that they wrote about little else.

Of these, the most remarkable is Aldous Huxley (b. 1894), who made his reputation with cynical, witty, and cleverly contrived novels about people in prosperous social groups. In his second period, his graphic short stories and travel books began to hint at an enlightened code of self-discipline not uninfluenced by the ancient religions of the East. The Second Great War revived his cynicism and he projected his disgust into, for instance, *After Many a Summer*, 1944. His three early volumes of verse, though neo-Georgian in form, are charged with the nostalgic and apprehensive melancholy which his later experiences confirmed.

The writer who most fully absorbed all these conflicting

tendencies and yet has gone furthest towards spiritual integration is T. S. Eliot (b. 1888). He began with descriptive satires as clear-cut as any Imagist could desire, yet suggesting the undercurrent of unbidden thoughts and the spontaneous cinema-like train of impressions, as attempted by the masters of the internal monologue. Though not technically a practitioner of free verse, he moved with equal freshness and freedom (*Prufrock and Other Observations*, 1917; *The Waste Land*, 1922; *The Hollow Men*, 1925). Though his ruminations appeared to be improvised, he worked into them a wealth of erudite allusions and figures, as if to remind readers that his inspiration sprang of its own accord out of the common heritage of culture: and in his prose-criticism (*The Sacred Wood*, 1920), he argued that to preserve tradition is to continue its spirit of inventiveness and adaptation. Yet he was as ready as any "modernist" to spring surprises on his reader. He maintained an attitude of impersonal yet scathing disapproval of his age, gradually, however, becoming more contemplative, almost devotional, and more obscure. In *Ash Wednesday* (1930), he indicated a spiritual struggle to escape from his irritated misanthropic lower self into the upper air of realities, where the spirit can breathe. In his series of elegies *Burnt Norton* (1936) to Little Gidding (1942), the poet seemed to be on the verge of discovering his true bearings in place and time.

#### Seekers after Truth

W. B. Yeats (1865-1939) began by reviving Irish folk-lore and legendry as being the only sure approach to what is deepest and most permanent in human nature. What he found there he projected into romantic epics, symbolical (not symboliste) dramas, and continued to proclaim in persuasive prose. In middle-life he mixed more with the world, and learnt to clarify his imagery and restrain his intensity in more vivid and concentrated lyrics (*Responsibilities*, 1914) and in more realistic drama (*The Player Queen*, 1922), yet without sacrificing his imaginative ways of expressing himself. Still the same Yeats, he finally succeeded in achieving verse that is "hard and dry" (*The Tower*, 1928; *The Winding Stair*, 1929).

These authors were adventurers, seeking truth above or below the surface of life. Others found quite enough adventure on the

surface itself. For instance Lytton Strachey (1880-1932), the complete humanist, portrayed 19th century personages as they would have appeared to the 18th, and ought to appear to the 20th; that is, as the victims rather than the victors of their public life (*Eminent Victorians*, 1918; *Queen Victoria*, 1921). By his insistence on the littleness of the great, he showed biographers how to practise the cunning of the novelist within the restrictions of the historian. In the 'thirties, some of the younger poets, unsympathetic or unequal to the flights of their elders, cultivated simplicity of outlook, studying their own personal reactions to what they loved in nature, other people, and themselves, including the spirit of fellowship which ought to unify a generation verging towards communism. A similar sense of common humanity appeared to satisfy such accomplished novelists as Howard Spring (b. 1889), J. B. Priestley (b. 1894), Charles Morgan (b. 1894), who maintained something like the range and manner of Dickens, Thackeray, or Meredith.

Geddie, 3 vols., 1938; Cambridge Bibliography of English Literature, ed. F. W. Bateson, 1940

**English River.** Estuary on the W. side of Delagoa Bay, in Mozambique, E. Africa. It is formed by the union of the rivers Umbelosi and Tembi.

**Englishry.** Term used in early English law. The presentment of Englishry was the offering of proof, in cases of violent death, that the person killed was an Englishman, not a Norman, as, if a Norman was killed, the community had to pay a fine. This collective punishment was abolished in the time of Edward III. The term was also used by Macaulay and others for the English settlers in Ireland.

**English-Speaking Union,** THE. An Anglo-American club. Founded in 1918 by Sir Evelyn Wrench "to draw together in the bond of comradeship the English-speaking people of the world," it is the oldest and largest organization of its kind, and has an autonomous sister society working in the U.S.A. The membership of the British society, including branches in the dominions and colonies, was 18,500 in 1946, that of the E.S.U. in the U.S.A. being 14,000. It publishes a bi-monthly magazine, and its activities include the provision of hospitality for American visitors to Great Britain, and the promotion of lectures. Its address is 37, Charles Street, London, W.1.

**Engrailed.** In heraldry, a line of division, or an outline of a charge, of irregular form, showing a series of semi-circles, with points outwards. The word, from Fr. *grêle*, hail, literally means cut into points like hailstones.

Engrailed in heraldry

**Engraver Beetle OR BARK BEETLE** (*Scolytidae*). Group of small cylindrical beetles, of which there are numerous species. Most of them burrow under the bark of trees, where the female lays her eggs in a straight tunnel, from which the grubs burrow out at right angles. Most of the species are extremely destructive, causing much damage to the forests of the U.S.A. and Europe. See Beetle.

**Engraving.** (1) Art of drawing on metal or wood by means of an incised line; and (2) impression in ink obtained from such drawing on paper or similar substance. In wood engraving the lines to be printed appear in relief, the wood between them being cut away. In the metal process, known as *intaglio*, the lines are sunk or incised

Engraving. Example of stippled engraving on copper of a sketch by G. Morland. Left, the copper plate on which the design was engraved. Right, the impression

by means of a graver or burin. The latter implement is a steel rod, four or five inches long, of square or lozenge section, with a cutting point and edges obtained by sharpening the head in an oblique section. There are various forms of wooden handle, the commonest one resembling an elongated half pear.

Plates of several different metals have been used for intaglio engraving: copper, steel, zinc, iron, silver, and even brass and pewter. Copper and steel, however, and especially copper coated with a thin layer of galvanised steel, are by far the most common. Pure copper is softer and easier to work than pure steel, but for the same reason does not wear so well under the press as the harder metal, and so does not throw off as many good impressions. The use of steel plates, though less ductile, was developed during the 19th century on account of their greater powers of resistance, until the copper plate covered with galvanised steel was substituted for them.

Wood engraving is really wood cutting, and so does not come within the scope of engraving proper. Lithography, which is a form of engraving on stone, is dealt with

under that title. The lines of an engraving on metal are often modified by the use of the etching needle, but etching, although a branch of engraving, differs from it in so many respects that it constitutes a separate art. The line of the graver, for example, is obtained by direct pressure upon the metal, whereas the etching needle is used in much the same way as a pencil, the subsequent incision being obtained by the "biting" of the acid on the plate.

There is evidence of the existence of wood-cut playing cards as early as 1440, but the earliest extant intaglio engraving, a "Flagellation" belonging to a Passion series in the Berlin Museum and attributed to a master in Upper Germany, is dated 1446. This disposes of Vasari's story that the invention of the art was due to Maso Finiguerra, the Florentine goldsmith and niellist, in 1460: there is reason to believe that even in Italy the art was being practised at least as early as 1450. Maso, however, may serve as a starting point for the history of that school of Italian engravers that arose directly out of the niello workers of the 15th century. At

Engraving. Wood block of a drawing by Harrison Weir, after Sir E. Landseer. Left, the wood block on which the outlines showing white are raised to catch the ink and make the black lines in the finished result shown at the right

first the taking of impressions from the gold and silver plates engraved according to the niello method by the goldsmith or silversmith was, doubtless, for the sake merely of checking his work; later as the artistic value of the impression itself became evident the scope of engraving was extended.

Among famous Italian painters of the 15th century who practised engraving were Antonio Pollaiuolo and Andrea Mantegna (*q.v.*) and Marco Antonio Raimondi, the engraver of Raphael's pictures, may be claimed as the first of the "reproductive" engravers. In Germany an illustrious school of engravers flourished in the late 15th century, including in its ranks Martin Schongauer Albrecht Dürer Albrecht Altdorfer, the Behams, and Heinrich Aldegrever. Line engraving was somewhat later in beginning in France, but Jean Duvert (1485-1561) and Jean Cousin (1501-89) were famous, and the French portrait engravers of the 17th century touched heights that have hardly been equalled since. In Great Britain the great artists of the 18th and early 19th centuries owe much to British "reproductive" engravers, and William Blake's work in this medium was unique.

**Engrossing** (*Fr. en gros*, in large). Term used by English lawyers for the copying out, in a "fair hand," of any legal document. A lawyer always makes out a draft of any important document, and has it engrossed, and the engrossment is executed by the parties concerned.

**Engrossing.** Word used in former days in England for what amounts to buying and selling wholesale. In other words the engrosser was a middleman. This was early regarded as an offence against law and custom, for it tended to put up the price, and various statutes declared it illegal, the chief being one of 1552. These were directed mainly against the buying and selling of corn and other foodstuffs wholesale, and the operation of the laws tended to keep these in and around the places where they were grown. As society became more specialised this was irksome, and even when the laws were in full force licences were issued allowing certain persons to buy and sell wholesale. In 1663 an Act permitted engrossing as long as the price of corn did not exceed 48s. a quarter and in 1773 the earlier statutes against it were repealed. As an offence against the common law engrossing disappeared finally in 1844.

**Enham**, or KNIGHT'S ENHAM Village of Hampshire, England 2 m. N. of Andover. In 1919 the Enham estate of 1,027 acres was taken over by the Village Centres Council for the establishment of a centre for disabled ex-servicemen after the First Great War. Living accommodation and workshops were erected for training men in furniture and boot making, carpentry, tailoring, building, painting, agriculture, horticulture, and the care of livestock and poultry. The British Red Cross made a grant of £10,000 for a medical block for the treatment of physical disabilities, and the psycho-therapeutic treatment of neurasthenic and shell-shock cases.

In 1945 a sum of £250,000 subscribed by the people of Egypt in gratitude for the battle of Alamein was set aside for the extension of the village centre to accommodate men disabled in the Second Great War. The memorial, known as Alamein village, provided for the erection of 100 houses, a medical unit, hostels, and ancillary buildings. The settlement was re-named the Enham-Alamein Centre. Its offices are at 16, Grosvenor Place, London, S.W.1.

**Enharmonic** (*Gr. enarmonikos*, fitting in). In music, the interval between, for example, E natural and F flat, or C sharp and D flat. Through the influence of the keyboard instruments, with their fixed twelve notes to the octave, the term often loses this meaning and is defined as "a change of name without a change of pitch."

Enharmonic. Example of enharmonic change in music

**Enid.** City of Oklahoma, U.S.A., the co. seat of Garfield co. It is 65 m. by rly. N. of Oklahoma, and has an airport. The centre of an oil, gas, and grain producing region and of dairy and poultry farms, it has oil refineries, grain elevators, meat-packing plants, flour mills, and rly. shops. It makes drills, farm implements, wagons, lorries, glue, and gloves. The seat of Phillips university, it dates from 1893, when it was granted its city charter Pop. 28,081.

**Enigma Variations.** Popular name for the Variations on an Original Theme (Enigma) for full

orchestra composed by Elgar as his opus 36 and first performed under Richter at S. James's Hall, London, June 19, 1899. The work, frequently performed in whole or in part, owes its sub-title to Elgar's statement that there runs through it another theme that is not heard. A grave, slow theme is followed by 13 variations, each given a title indicating by initials or a nickname one of the composer's "friends pictured within." All have been identified, from no. 1, the composer's wife, to the finale, which runs straight on from No. 13, and represents Elgar himself. Sensitive treatment of solo instruments and an orchestral richness mark the whole work.

**Eniwetok.** Atoll in the Marshall Is. (*q.v.*). Fortified by the Japanese, Eniwetok was attacked by U.S. forces in 1944. Engebe, chief island in the atoll, was seized Feb. 18, Parry I. Feb. 22; 3,000 Japanese were killed in the fighting. In 1947 Eniwetok was made into a permanent testing ground for atomic weapons, its 145 inhabitants being transferred to another of the Marshall Is.

**Enlarger.** Photographic apparatus for making a print of a larger size than the negative. An image of an illuminated negative is projected by means of a lens upon a sheet of bromide paper. The illumination can be equalized by interposing a condenser between illuminant and negative, a diffusing screen of ground glass or opal, or a combination of condenser and screen. The negative image is thus focused upon an easel. Such apparatus is used in a dark room; enlarging boxes and cameras can be used in daylight, the bromide paper being carried in a loose dark slide.

**Enlistment.** Act of the individual in voluntarily contracting to render military service as a private soldier to the state. In Great Britain the form of contract is the attestation paper, which the recruit, after being accepted and passed as medically fit, signs when taking the oath of allegiance, in the presence of an officer, magistrate, or other public dignitary, who witnesses or attests the signature. The period of service in the British army is laid down in the Army Act and recruiting regulations, and is normally 12 years, which may be spent wholly with the colours or part with the colours and part in the army reserve. Recruits may choose the branch of the service they prefer, and skilled men usually select one of the specialist corps. In the line the

recruit may choose any regiment for which he has a preference and which is open to recruiting. He cannot then, during peace time, be transferred to another regiment without his consent. In an emergency it may be necessary to seek powers by Act of Parliament for compulsory transfer of men from one corps to another to meet the exigencies of the service. A special branch of the army is detailed for recruiting duties, with an officer in charge of each district. Aliens and negroes may enlist in the British army, but cannot be promoted beyond the rank of warrant officer.

**Enna.** Ancient city of Sicily, the modern *Gastrogiovanni* (*q.v.*). It is first mentioned in history as having been taken by Dionysius I c. 397 B.C. It took part in the last Greek revolt against Rome and its people were massacred; in 134-132 B.C. it figured in the first great slave revolt as headquarters of the rebels. Originally Henna, it was known to the Romans as *Castrum Ennae*, corrupted in Arabic to *Kasr-Yani*, whence its modern name. It was a centre of Demeter-worship.

**Ennerdale.** Lake in the W. of Cumberland, England. From it Whitehaven draws its water supply; it is 3 m. long and  $\frac{1}{2}$  m. broad. In 1946 it was proposed to build a barrage at Ennerdale to raise the level of the lake by 5 ft. The project was opposed by the Friends of the Lake District and was temporarily suspended.

**Ennis.** Urban dist. and county town of co. Clare, Eire. It stands on the Fergus river, 25 m. N.W. of Limerick by rly. Here are the Roman Catholic pro-cathedral and college of the diocese of Killaloe, and the ruins of a Franciscan abbey. Ennis has a statue of O'Connell and in the neighbourhood are the ruins of Clare Abbey. Furniture and bootlaces are made, while milling is another industry. Market day, Sat. Pop. 5,868.

**Enniskillen** OR INNISKILLING. Market town and co. town of Fermanagh, N. Ireland. It stands on an island in the river between the upper and lower loughs Erne, and has suburbs on either side, with which it is connected by bridges. It has a rly. station

Enniskillen arms

90 m. W.S.W. of Belfast. There are some small manufactures and a fair trade in agricultural produce. Enniskillen became a municipality

about 1600, and was represented in the Irish parliament. From 1800 to 1885 it sent one member to the parliament of the U.K. It is chiefly famous, however, as a Protestant stronghold in the time of William III, and as giving its name (in the form Inniskilling) to two regiments of the British army, fusiliers and dragoons. Market days, Tues. and Thurs. Pop. 6,030.

**Ennius.** QUINTUS (239-169 B.C.). Earliest of the great Roman poets. Born at Rudiae, in Calabria, he was not a full Roman citizen, acquiring that privilege at a later date. While serving in the Roman army in Sardinia, he attracted the notice of the elder Cato, who took him to Rome, where his knowledge of Greek and literary acquirements procured him admission to the Scipionic circle. His works embraced a wide variety of subjects, but it was as the author of some twenty tragedies and of the *Annales*, an epic of Roman history—in which, for the first time, the Latin language was moulded to the Greek hexameter—that Ennius achieved immortality. Only fragments of his works survive, chiefly in the form of quotations in later writers, especially Cicero. Some ancient critics regarded him as the equal even of Virgil, but his versification, though possessing a certain rugged dignity, is harsh compared with the finish which Latin poetry attained in the hands of Horace and Virgil.

**Enns.** Town and river of Austria. The town, which is 11 m. S.E. of Linz, stands just where the river falls into the Danube. An old place, it grew up around a castle built about 900. It became a free city, and was at one time a prosperous commercial place. Its chief buildings are the town hall, the castle, built in the 18th century, and a Gothic church. The river rises in the mountains near Radstadt and flows through Styria, passing through lovely mountainous scenery. Its course is east and then north. Its chief tributaries are the Salza and Steyer; its length is about 150 m.

**Enoch.** Name of four men in the O.T. They are a son of Cain, a grandson of Abraham, a son of

Enniskillen, Fermanagh, N. Ireland. View of the town and quays on the river connecting the upper and lower loughs Erne

Reuben, and a son of Jared. The last, the father of Methusaleh, is recorded to have lived 365 years, and to have been translated without dying. He is described as being the seventh from Adam, and the Epistle of Jude (verse 14) quotes a prophecy ascribed to him.

**Enoch, THE BOOK OF.** One of the non-canonical O.T. Apocrypha or Pseudepigrapha (*i.e.* works written under an assumed name), written originally partly in Aramaic and partly in Hebrew. It incorporates fragments of the Book of Noah. The work is not a unity in any sense, and ranges from about 200 B.C. to A.D. 64. It has therefore been described as a library rather than a single book. In the words of Dr. Charles (Religious Development Between the Old and the New Testaments), "it touches upon every subject that could have arisen in the ancient schools of the prophets." These subjects include the origin of evil, the millennium, the Messiah, the future life, and even the Hebrew calendar. The book seems to have had a considerable influence on N.T. theology. See Apocrypha.

**Enoch, BOOK OF THE SECRETS OF.** A book belonging to the same category as the Book of Enoch (*v.s.*). Dr. Charles describes this book as 2 Enoch and the Book of Enoch as 1 Enoch. The work, preserved only in Slavonic, seems to have been written by a Hellenistic Jew in Egypt at about the beginning of the Christian era. It is related in some way to a Hebrew book referred to in Jewish literature (in the Zohar) as "the Book of Enoch" and the "Book of the Secrets of Enoch." The writer is orthodox, but at the same time so broad-minded as to adopt into his philosophical system Platonic, Egyptian, and Zend elements. The book describes Enoch's ascension and voyage through the seven heavens.

**Enoch Arden.** Narrative poem in blank verse by Tennyson, written in 1862 and published two years later. It tells of a seaman who travels abroad, is wrecked, and after years without communication comes home to learn that his wife has married again. There are beautiful descriptive passages, and a quiet emphasis, characteristic of the poet, on change and loss as elements in life.

**Ensa.** Popular name for Entertainments National Service Association, formed in 1939 by Basil Dean to provide entertainment for personnel of the British services. Ensa had its headquarters at the Theatre Royal, Drury Lane,

Ensa badge

London, and assumed responsibility for entertaining troops at home and overseas, being sponsored by the Navy, Army, and Air Force Institutes. Its activities included variety, concerts, drama, broadcasting, and cinema shows. On Nov. 12, 1939, the first concert was given to the B.E.F. in France, and up to June, 1940, over 5,500 entertainments were given in that country and attended by 2,242,559 persons.

In Great Britain each command was allotted about 20 parties giving 150 performances a week. From July, 1940, to Jan., 1942, audiences totalled 50,000,000. During 1942-43 Ensa parties were transported to and from 22,000 locations, travelling some 2,000,000 miles. They toured in North Africa, the Middle East, Italy, Iceland, and India. In 1944, 30,000 cinema shows and 12,000 stage performances drew nearly 20,000,000 people. The total expenditure of Ensa, excluding India and Burma, was almost £15,000,000.

India had its Ensa, although, owing to the long distances to be travelled, units were encouraged to provide their own entertainment. In Burma the first shows were given in March, 1944, on the Imphal sector; on the Chindwin performances were under an armed guard, lest a Japanese patrol should attack. By Jan., 1945, ten concert parties, five dramatic companies, and a pool of artists were operating in India, Ceylon, and Burma. Troops isolated in Waziristan, Persia, Iraq, and Tanganyika were visited by Ensa parties. In N.W. Europe, during the long, bitterly cold winter of 1944-45, Ensa sometimes

performed in lavishly equipped theatres in base areas, more often in half-demolished buildings close to the front line. Rediffusion vans, equipped with libraries of 500 records, visited troops in out-of-the-way localities.

At home Ensa artists provided entertainments for British and Allied forces and civilian war workers throughout the country until March, 1946. Ensa was succeeded by Combined Services Entertainment, which provided for every soldier a cinema show at least once a week and a live performance every five weeks; it was disbanded on Aug. 31, 1946, having provided some 2,500,000 performances for over 500,000,000 people.

**Enschede.** Town of Holland, in the prov. of Overijssel. It is 29 m. E.N.E. of Zutphen, and is a seat of the cotton-spinning and weaving industries. Enschede is a rly. junction. It was severely damaged by a conflagration in 1862. The British 11th armoured division liberated it from the Germans in the Second Great War, April 2, 1945. Pop. 90,289.

**Ensemble** (Lat. *in simul*, at the same time; Fr., together). In music, something which is considered as a whole, or with all the parts taken together, e.g. the united performance of all voices or instruments engaged in rendering a piece of concerted music, like a quartet or quintet; the united performance of an orchestra or chorus; the total effect of such performance. By extension the term is applied to a theatrical performance, including scenery, costumes, etc.

**Ensign.** Flag which a ship carries astern to indicate her nationality. Each country has separate

earliest date on which the S. George's cross, the forerunner of the white ensign, was flown by English admirals was in the Cadiz expedition of 1596. The Royal Air Force ensign consists of a sky-blue ground with the union flag in the jack and the R.A.F. red, white, and blue roundel in the fly. The civilian ensign is also of sky-blue ground with the union flag in the jack; it carries in addition a dark blue cross edged with white. War department vessels fly a blue ensign with crossed swords in the fly. When a ship flies her ensign upside down it denotes that she is in distress. *Pron.* Ens'n. *See* Flag.

**Ensign.** Rank in the British army, now obsolete. It was given to an officer of the infantry on first being commissioned, and it was his duty to carry and guard the regimental colours, both on parade and in the field. The corresponding rank in the cavalry was cornet, and both were discarded in 1871 when the purchase of commissions was abolished, the rank of second-lieutenant being substituted. Ensign is a rank in the United States navy held by the lowest grade of officer and equivalent to midshipman in the Royal Navy. *Pron.* En'sine.

**Ensilage.** Food for farm livestock produced by preserving fodder crops in a green, succulent condition for use at a later date. When the cost of labour in the production of root crops was low, the practice of ensiling fodder material did not receive much attention in Great Britain; now with greatly increased labour costs the practice is general. Crops best suited for ensiling are mixtures of oats and tares, oats and peas on light land, and oats, beans, and tares on heavy land. Tares and peas require a plant such as oats to support them and prevent their becoming fouled with soil in wet weather. But any green, succulent vegetable material can be ensiled; and in weather unfavourable for hay-making, grass is frequently used. In the U.S.A. green maize, sorghum, and sunflowers are commonly grown for ensilage.

The three methods by which ensilage is made are siloing, clamping, and stacking. The silo is a building of timber, concrete, etc., frequently taking the form of a tower 30 or more feet high. The silage crop is gathered in a green condition, cut into small lengths, blown into the top of the silo, and distributed and consolidated by hand. Silos of

Ensign. White ensign flown by Royal Navy

ensigns for its navy and its mercantile marine. Great Britain has three, allocated since 1864 as follows: the white ensign is flown only by ships of the Royal Navy and vessels of the Royal Yacht Squadron; the blue ensign is the flag of the Royal Naval Reserve; and the red ensign is the flag of the merchant service. The

this description involve substantial capital outlay but are free from the waste occurring in clamping or stacking. Clamping consists of dumping the green crop straight from the field into an excavated space 1-3 ft. deep. Consolidation is provided by the filled carts which are drawn over the top of the clamp as it is formed. Earth is then piled against the sides and on top of the heap to maintain compactness and exclude the air. Silage stacks, built at any convenient position in a field, are formed of the green crop carted straight from the field after cutting.

The material resulting from the three methods of preparation is described as "sweet" or "sour." Sweet silage has a pleasant smell like that of slightly heated hay; it is usually dry, light brown in colour, and gives rise to lactic acid; livestock eat it readily. Sour silage is much darker in colour and possesses an unpleasant odour due mainly to butyric acid. The differences in the two forms arise from the method of making: sweet silage is produced in the presence of a liberal supply of air, and in the early stages the temperature rises to as much as 50° C.; but in sour silage the amount of air circulating in the heap is limited, and the chemical changes involved are in part putrefactive and brought about largely at the expense of protein.

**Ensor, JAMES, BARON** (1860-1949). Belgian painter. The son of an English father and a Flemish mother, he was born April 13, 1860, at Ostend, where, except for three years at the Brussels academy, 1877-1880, he spent his life. In 1930 he adopted Belgian nationality, and was created a baron. When Belgian art was foundering in a realism that was by turns affected, sentimental, and vulgar, Ensor's work had a great influence not only in his adopted country, but upon all European art. Recognition, however, was slow, and not until 1929 was Ensor's reputation established with a retrospective exhibition in Brussels. The element of fantasy which distinguished much of his subject matter was at its best in such works as *Skeletons Warming Themselves*, and *The Battle of the Golden Spurs*. Exhibitions of his work were held at the Leicester Galleries, 1936, and the National Gallery, 1946. He died Nov. 19, 1949.

**Ensor, ROBERT CHARLES KIRKWOOD** (b. 1877). British historian. Born Oct. 16, 1877, he was educated at Winchester and

Balliol College, Oxford, and was called to the bar in 1905. A leader writer on the *Manchester Guardian*, 1902-04, and the *Daily News*, 1909-11, he was chief leader writer on the *Daily Chronicle*, 1912-30. Deputy for the Gladstone professor of political theory and institutions at Oxford, 1933 and 1940-44, he became a research lecturer at All Souls. His *Modern Socialism* appeared in 1903, and his best known books include *Columbus*, 1925; *Courts and Judges*, 1933; *England, 1870-1914*, 1936; *A Miniature History of the War*, 1945.

**Enstatite**. A common rock-forming mineral. One of the pyroxene group, it crystallises in the orthorhombic system, in stout prismatic crystals. Chemically essentially a metasilicate of magnesium, it occurs in the intermediate and basic igneous rocks, low in lime content, also in derived serpentines and, less commonly, in metamorphic rocks. It is often found in parallel growth with a monoclinic pyroxene. It is a common constituent of metallic and stony meteorites.

**Entablature**. Term in architecture signifying the combination of architrave, frieze, and cornice at the summit of a building. In early Greek architecture the entablature, like the supporting column, was frequently of wood; and there is evidence to show that it was constructed of this material for some time after wooden columns had been replaced by stone or marble. In the Greek towns of S. Italy wooden entablatures upon stone columns are known to have been in use for several centuries. The entablature is necessarily a prominent feature of the classic or horizontal styles of architecture, rather than of the Gothic or vertical styles; but its principle is universal. The original meaning of the word was a board work or flooring (Lat. *tabula*, plank). See *Architecture*; *Cornice*.

**Entail**. The settling of an estate on a man and the heirs of his body. In feudal times land was granted to a man and his heirs in tail male or tail general, the idea being that if an heir failed it would revert to the king or lord who granted it. In time, however, the practice grew up of regarding it as a free estate as soon as an heir was born, thus depriving the grantor of his rights. The statute *De Donis Conditionalibus* of Edward I put an end to this practice, but only for a time, as legal fictions for evading it were in-

vented. The entailed estates of today are simply settled estates, but they can be settled only on living persons and a period of 21 years beyond. In 1926 entails ceased to be legal estates and are now equitable interests, more properly called entailed interests. They are still part of the system of settlement under which large landed estates are held. See *Land Laws*; *Real Property*; *Settlement*.

**Entamoeba**. Any member of a group of protozoa parasitic within some host, usually in the gut. Various species cause disease, e.g. amoebic dysentery.

**Entebbe**. Administrative capital of the Uganda protectorate, E. Africa. It is situated on a promontory to the W. of Murchison Bay in Lake Victoria, and is connected with Kisumu and other lake harbours by steamer. Mengo, the capital of Buganda, is 25 m to the N.E.

**Entente Cordiale** (Fr., cordial understanding). Phrase that became current early in the 20th century to signify the friendly relations then beginning to exist between Great Britain and France. The entente began soon after the South African War and was greatly helped by the influence of Edward VII and the growing realization of the German menace. It led to the alliance of 1914.

**Enteric Fever** (Gr. *enterikos*, intestinal). Infective disease caused by the bacillus typhosus. It is commonly contracted by drinking infected water or milk. See *Typhoid Fever*.

**Enteritis** (Gr. *enteron*, intestine). Inflammation of the mucous membrane of the intestine. The condition may be due to eating unsuitable or unsound food, such as unripe fruit or decomposing meat, or to irritant poisoning by arsenic, mercury, and other substances. Secondary enteritis is a symptom of many diseases, particularly cholera, dysentery, and typhoid fever.

The prominent characteristics are abdominal pain, severe diarrhoea, and sometimes blood in the evacuations. In severe cases ulceration of the intestine may be followed by perforation and fatal peritonitis. Epidemic enteritis, or "summer diarrhoea," can be a fatal disease among infants under one year of age, in large towns sometimes accounting for one-fifth of the total infant mortality. The disease is most prevalent in hot, dry weather, the dust blown up from dirty streets and refuse heaps being an important causative

factor. Treatment should deal with the essential cause and with the diarrhoea.

**Enteroptosis** (Gr. *enteron*, intestine; *ptosis*, falling). General downward displacement of the abdominal organs, in particular the stomach and intestines. The condition develops gradually, and is more frequent in women than in men, encouraged possibly by the stretching of childbirth or by the greater width of woman between the pelvic bones. Enteroptosis is often found in association with neurasthenia; a highly strung nervous system is more aware of the discomfort caused by the pull of the displaced organs, and, conversely, the displaced organs exercise a malign influence on the system. Massage, electricity, and physical exercises improve the tone of the slack abdominal muscles, and distress is often relieved by the wearing of a belt so designed as to support the sagging structures.

**Enterprise.** British steamship, the first to make the passage between Great Britain and India. She left London Aug. 16, 1825, and reached Calcutta Dec. 7. The *Enterprise*, which displaced 480 tons and had engines of 120 h.p., was also the first steamship to double the Cape.

**Entertainments Duty.** Tax levied in the U.K. on charges for admittance to entertainments, i.e. any exhibition, performance, amusement, game, or sport; first introduced as a war measure in the budget of 1916, and since retained with modifications. Duty is payable even if the person making the charge is not connected with the entertainment, as where persons pay to see a procession from a window. There are many exemptions; the most important are: (1) Entertainments where the gross takings are devoted to philanthropic or charitable purposes. If the expenses do not exceed 50 p.c. of the takings, duty is payable in the first place but will be refunded. (2) Entertainments which are wholly educational. (3) School and similar entertainments by past or present pupils if the school is not conducted for profit. (4) Certain industrial, artistic, or public health exhibitions.

The rate of duty varies with the price of admittance, and is altered from time to time in the budget. No duty is payable on payments of 3d. or less. Mainly to assist theatres a reduced rate was introduced in 1935 and

extended in 1946 for certain entertainments where all the performers are actually present—e.g. stage plays, ballets, concerts, lectures, recitations, music hall and variety entertainments, circuses, and travelling shows, menageries, or any game or sport except the racing of animals, vehicles (other than pedal cycles), motor vessels, and aircraft. At some entertainments no duty is chargeable at all since the Finance Act, 1946, if the entertainment is provided by an organization not conducted for profit and whose activities are partly educational.

**Enticement.** Term in law. Anyone who induces a wife to leave her husband so that he loses her "comfort and society" may be sued by the husband for damages for enticement. In 1923 it was decided that a wife has a similar remedy against anyone who induces her husband to leave her. It is not necessary that the wife or husband should have committed adultery with the enticer.

**Entombment.** Literally a burial. In a special sense, however, it is applied to the burial of Jesus Christ, and as such is the subject of several notable paintings. The most famous of these are one by Raphael, in the Borghese Palace at Rome, one by Titian in the Louvre, and one by Caravaggio, in the Vatican.

**Entomology** (Gr. *entomon*, insect; *logos*, science). Branch of zoology which deals with insects. The offices of the Royal Entomological Society of London are at 41, Queen's Gate, S.W.7. The Imperial Institute of Entomology is housed at the Natural History Museum, London, S.W.7. See Insects.

**Entomostraca** (Gr. *entomon*, insect; *ostrakon*, shell). One of the divisions into which crustacea (q.v.) are divided. It includes the lower forms of crustaceans.

**Entozoa** (Gr. *entos*, within; *zōon*, animal). The name given to parasitical forms which live in the interior of the body of their host. Examples are the tape worm and flukes. They are opposed, therefore, to the ectozoa, which live on the exterior. See Parasite.

**Entr'acte** (Fr. *entre*, between; *acte*, act). Short piece of music played by the orchestra between the acts or scenes of a play. It is generally of a suave and melodious character. Sometimes, in a musical play, it consists of the development of a melody or *leitmotiv* embodied in the work; sometimes of an independent piece.

**Entrecasteaux, JOSEPH ANTOINE BRUNO D'** (1739-93). French sailor. A native of Provence, he entered the navy. He commanded a ship in the war against Britain, but his great work was as a discoverer. As commander of the French fleet in the E. Indies, he visited China; he was also governor of Mauritius and the Île de Bourbon. He sailed into the South Seas and made several discoveries therein, a strait, a point, and a group of islands commemorating his name (see D'Entrecasteaux). He was in the East when he died, July 20, 1793.

**Entre Minho e Douro.** Prov. of N.W. Portugal. It lies between the Minho and Douro rivers, facing the Atlantic. Mountainous and well watered, it has a mild climate, and produces maize, wine, oil, fruit, and nuts, while palms and fuchsias thrive. Cattle and pigs are reared, timber is cut on the mts., and fish abound in the rivers. Though implements are primitive, agriculture flourishes. The roads are bad; ox-traction is the chief form of transport. The Oporto-Corunna rly. runs near the coast. Oporto is the chief port. This most densely populated prov. is divided into the three districts of Vianna do Castelo, Braga, and Porto Area, 2,790 sq. m. Pop. 1,679,798.

**Entrenchment.** Military term for an excavated position protecting troops in attack or defence. Entrenchments became necessary with the development of firearms, and were first used on a large scale by the Turks in the 15th century. The fire-power of machine-guns and the use of shrapnel and high explosive, combined with the vulnerability of infantry, necessitated large-scale development of entrenched warfare during the First Great War. It continued until the introduction of tanks. The mobile armoured operations of the Second Great War rendered permanent entrenchments obsolete, and such forms of defence were restricted to slit trenches and fox-holes for the temporary protection of advancing infantry held up by air or artillery attack.

**Entrepreneur** (Fr. *entre*, between; *prendre*, to take). Word used for one who brings capital and labour together. Employing them as he thinks best, he pays interest to the one and wages to the other, keeping any balance of profit for himself. The old theory of economics that the partners in industry were the

landowner, the capitalist, and the labourer left out of account the fact that in large undertakings the directing brain often belonged to none of these classes. He was simply one who hired the others, and the word *entrepreneur* was invented to describe him.

**Entre Rios** (Span., between rivers). Prov. of N.E. Argentina, occupying the angle between the Paraná and Uruguay rivers. The surface is low, alternating between swamps and prairies, while in the N. it is heavily forested and furnishes wood for building and cabinet-making. Cattle, sheep, and horses are raised by the million, and, together with hides, horns, and other animal products, are exported. Cereals, wine, and alfalfa are grown. The prov. has a healthy climate, and, traversed by several rlys. and waterways, it is one of the most prosperous in the republic. The capital is Paraná. Area, 30,243 sq. m. Pop. 564,198.

**Entre Rios.** Town of Brazil, in the state of Rio de Janeiro. It is about 50 m. by rly. N. of Rio de Janeiro, in a coffee-producing district. There is another Brazilian town of this name in the state of Goyaz, 45 m. N.W. of San José.

**Entropy** (Gr. *entropē*, turning in). An important concept in the theory of heat engines and the science of thermodynamics. The entropy of a substance is a quantity which increases with any increase in the total heat of the substance and likewise decreases with any decrease in the total heat. The change of entropy is measured by the change in the quantity of heat divided by the absolute temperature at which this change takes place. Thus the entropy of a system under what are known as adiabatic conditions, where heat neither enters nor leaves the system, is constant.

Where heat simply flows from a hot body to a cold one, the loss of entropy by the hot body is more than made up by the gain of entropy by the cold body, so that there is a net gain of entropy on the whole. In a heat engine, heat flows from a hot body to a cold one, but in the process some of the heat disappears, being converted into work. With a theoretical engine of maximum efficiency, there would be no change of entropy due to this process, but no actual engine succeeds in converting as much of the heat into work as the theoretically perfect engine, and the effect of an actual heat engine is a net gain of entropy.

As heat is everywhere flowing from hot bodies to cold ones, the entropy of the universe as a whole is continually increasing, and is often said to be tending towards a maximum. In such an imaginary condition of maximum entropy there would be no motion, all the existent energy of the universe would be converted into heat, and the whole would stagnate at a uniform temperature. In the earth's atmosphere entropy increases slightly from the surface until the base of the stratosphere is reached; thence entropy increases rapidly with height. Meteorologically the condition of any level of the atmosphere at a given time is defined by a statement of its entropy, its temperature, and its water vapour content. See Carnot's Cycle; Energy; Thermodynamics.

**Enuresis** (Gr. *en*, in; *ourein*, to urinate). Involuntary discharge of the urine. It is commonly seen in young children who have not acquired full control over the bladder. If it occurs at night, it is known as nocturia. It may be due to irritation of the bladder walls by acid urine or by a polypus, or to the presence of worms in the rectum. The condition is associated with some forms of paralysis. If a case persists, threats of punishment may do much harm, as the underlying cause may be a psychological maladjustment needing skilled treatment.

**Envelope.** Gas bag of an airship, or, in a rigid airship, the whole body of the vessel within which the gas bags are housed. Gas bags are made of skin or fabric, and the outer envelope of the rigid airship is a stouter fabric, rubberised or otherwise treated so as to resist absorption of moisture and the effects of weather. See Airship.

**Enver Pasha** (c. 1882–1922). Turkish soldier and politician. Born at Apana, on the Black Sea, of humble parentage, he entered the Turkish army in 1896. He first came into notice in connexion with the Young Turk movement in 1905 at Salonica, and later joined the revolutionaries who, in July, 1908, captured Monastir, where a constitution, accepted by the sultan Abdul Hamid, was proclaimed. Enver soon afterwards was appointed military attaché at Berlin, but on the outbreak of the Turkish counter-revolution in March, 1909, he returned to Salonica, and assisted in the deposition of Abdul Hamid.

Enver then went back to Berlin, and in 1910 paid a visit to

London. In 1911 he organized the Arabs of Tripoli against the Italians in the Tripoli War.

Enver Pasha,  
Turkish soldier

In the second Balkan War he recaptured Adrianople from the Bulgarians in July, 1913. Shortly before, he had become minister of war with the rank of pasha, and married one of the imperial princesses. One of the leading spirits of the Committee of Union and Progress, the central organization of the Young Turks, he was personally pro-German, his influence being one of the factors that brought Turkey into the First Great War against the Entente. After the submission of Turkey in 1918 Enver fled to the Caucasus. He encouraged the Turks in their resistance to the terms of the peace treaty in 1920. He was killed in Bukhara, Aug. 4, 1922.

**Environment** (Fr. *environ*, around). Biological term for the sum total of all the conditions, agencies, and influences which affect the development, growth, life, and death of an organism, species, or race. Various theories of evolution have maintained, on the one hand, that variations in animals and plants arise fortuitously, and may fit the organism for life in particular environments; on the other hand, that environment itself produces modification in the living organism. In the absence of adaptation to environment, no organism could live and reproduce itself, and the ultimate object of a living creature must be reproduction. The term is usually understood to refer to physical, chemical, or material agencies. With reference to highly evolved animals it includes, in its widest sense, mental influences, so that it may be said that each individual lives in an environment consisting of physical, mental, and, for man, spiritual parts. In education and psychology, the perennial argument whether heredity or environment (nature or nurture) plays the more important part in an individual's mental development remains unresolved, most eugenicists claiming the former and many educationists the latter as the more potent influence. See Ecology; Eugenics; Evolution; Heredity.

**Envoy** (Fr. *envoyer*, to send). Term used for one sent to a diplomatic errand. It is more general

than ambassador, being used for persons who go on temporary missions to foreign courts as well as for more permanent officials. The former are described as envoys; the latter are envoys extraordinary, and include ambassadors. See Diplomacy.

**Enzyme** (Gr. *en*, in; *zymē*, leaven). A complex organic substance formed by living cells. Often described as biochemical catalysts, enzymes are classified according to their properties, their chemistry not being fully understood. They exist in the colloidal state, and may be rapidly inactivated when heated in the presence of moisture.

Enzymes play a part in industrial processes such as brewing, baking, and cheese making, and as laboratory agents in pharmacy. The most familiar example of their action is the fermentation of sugar by yeast, a minute unicellular organism. Yeast cells contain an enzyme which converts sugar into alcohol and carbonic acid gas. Enzymes help, too, in the digestion of food. Ptyalin, secreted by the salivary cells, converts cooked starch into dextrin and maltose; pepsin, secreted by cells in the stomach, changes protein to proteoses and peptones; and enzymes in the pancreatic juice convert fat into simpler bodies. The souring of milk and the decomposition of meat by bacteria are other instances of enzymic change.

It is suggested that consciousness in some way depends on enzyme action in the brain cells; that unconsciousness resulting from an anaesthetic depends upon a cessation of their enzyme life. Enzymes are vitally necessary to every chemical process involved in respiration. The action of many poisons and anaesthetics depends on paralysis of the respiratory exchange of a specific group of cells. See Fermentation.

**Eoanthropus** (Gr. *ēōs*, dawn; *anthrōpos*, man). Systematic name of the oldest known European race with distinct head traits. It was given by A. S. Woodward to some fossil bones now in the British Museum, unearthed in 1912 at Piltdown, Sussex. After their discoverer, Charles Dawson, the species is called *E. Dawsoni*. Other remains were subsequently found. See Man; Piltdown Skull.

**Eocene** (Gr. *ēōs*, dawn; *kainos*, recent). Name given to the earliest part of the Tertiary period, when stratified rocks, the eocene system, were being formed. It followed the

Cretaceous period, the strata of both ages merging gradually in S. Europe, America, and New Zealand. In W. Europe, at the end of the Cretaceous period, great geographical changes were in progress; consequently there is a sharp line of demarcation between the two sets of strata. Eocene beds usually rest on eroded surface of chalk. Eocene rocks of W. Europe are usually soft sands and clays, with some limestone and marl; all were laid down in local basins under marine, brackish, or fresh-water conditions. In S. Europe, Caucasus, Asia Minor, N. Africa, through Persia towards China and Japan, great thickness (several thousand feet) of limestone developed, made up in places largely of the fossilised shells of large disk-shaped foraminifera (nummulites). Volcanoes were active in eocene times, old lavas and other forms of rock being found in Antrim, Inner Hebrides, Apennines, Western U.S.A., etc.

The forerunners of nearly all kinds of animals now living appeared in eocene times. The early ancestors of the horse had then five toes; small, pig-like, marsh-dwelling animals in Africa represented the original stock from which elephants came. Placental mammals appeared in great numbers. Crocodiles and toothed birds lived in a sub-tropical estuary where London now stands. Important areas of eocene deposits are known as London, Hampshire, and Paris basins. Various beds in the London basin, in order of succession, are Thanet Sands (at base), Woolwich and Reading Beds, Blackheath Pebble Bed, London Clay, Bagshot Sands; total thickness about 970 ft. Those of the Hampshire basin are much thicker, and slightly different; no Thanet Sands at base, great development of Barton Beds at top, and Brocklesham and Bournemouth Beds in the middle.

**Eolian Deposits.** This term in mineralogy is also spelt Aeolian and is so listed in this work.

**Eolis.** Small nudibranch mollusc. It has no shell and no true tentacles. It has secondary gills and is marine.

**Eolith** (Gr. *ēōs*, dawn; *lithos*, stone). Stone implement of ruder workmanship than those of the Palaeolithic age, so called in 1892 by J. Allen Brown. Theoretically the Chellian hand-axe had a long antecedent history, back to the time when primeval man, or even his anthropoid precursors, first employed unwrought stones as tools. Many such flints have been

found, notably at Ightham, Kent, and in the Ipswich Red Crag, for which human use is claimed. A characteristic hawk-beak form (rostracarinata) is regarded by Ray Lankester as ancestral to true palaeoliths. The colithic stage of industry was traceable in modern savagery among the aboriginal inhabitants of Tasmania.

**Eon de Beaumont**, CHARLES GENEVIÈVE LOUISE D' (1728-1810). French diplomat. Born

Eon de Beaumont, French diplomat

in Burgundy, Oct. 5, 1728, he entered the army in 1755, and in 1757, having attracted the attention of Louis XV, was sent, disguised as a woman, on a diplomatic mission to Russia.

In 1762 he came to England, where in a fit of pique he published certain libels for which he was convicted in 1764 and outlawed. The question of his sex had aroused such controversy that heavy bets were made and gambling policies of assurance effected. General opinion declared him a woman, and Eon took no steps to decide the matter. He returned in 1777 to France, where he lived as a woman, but came back to England in 1785, and ten years later, having lost everything in the French Revolution, dressed as a woman he gave an exhibition of fencing in London, where he died, May 21, 1810. A post-mortem examination showed masculine characteristics.

**Eos.** In Greek mythology, goddess of the morning. She is identified with the Latin Aurora (*q.v.*).

**Eosin.** Scarlet-coloured aniline dye prepared by the action of bromine upon fluorescein. It occurs as dark brown crystals with a green metallic lustre, different strengths and shades of colour being distinguished commercially by the addition of letters, e.g. A, GGF, DH. It is used to make red ink, as a dye for fabrics, paper, and cosmetics, and as a stain in microscopy. See Dyes.

**Eöthen** (Gr., from the East). Travel book by A. W. Kinglake, first published in 1844 with the full title of Eöthen; or Travels Brought Home from the East. A most engaging book, it describes the author's journeyings from Belgrade to Constantinople and Cairo, and through Palestine.

**Eötvös, JOZSEF, BARON** (1813–71). Hungarian novelist and statesman. He was born Sept. 3, 1813, at Buda, and educated at the university there. After travelling extensively in Western Europe, he returned to Hungary, and in 1838 produced his novel *The Carthusian*, a sentimental study of a wealthy young French count who retires from the world and becomes a monk. His second novel, *The Village Notary*, 1846, is an attack upon serfdom and other evils. His Hungary in 1514, an historical romance describing the great peasant rising under Dozsa, and the terrible vengeance taken by the nobles, appeared in 1847. The Influence of the Leading Ideas of the Nineteenth Century upon the State (1850–54) is an attempt to show how far it is possible fully to realize the doctrines of liberty, fraternity, and equality. Eötvös was twice minister of public instruction, in the first Hungarian ministry of 1848 and in the Andrássy ministry of 1867, and set up a system of national education. He died Feb. 2, 1871.

**Eozoon** (Gr. *ēōs*, dawn; *zōon*, animal). Name given to mineral structure, consisting of thin wavy layers of white calcite and green silicate (serpentine), curiously intergrown, and resembling structures of certain lowly organisms. Found in the pre-Cambrian rocks in Canada, it was formerly regarded as of organic origin.

**Epacris** (Gr. *epi*, on; *akris*, top). Genus of shrubs of the family Epacridaceae. Natives of Australasia, they have scattered leaves and abundant, cylindrical, bell-shaped flowers produced singly from the axil of a leaf. They are largely grown in European greenhouses, and many varieties and hybrids have been produced. A few species have edible berries.

*Epacris nivalis*, a greenhouse plant from Australia

**Epact** (Gr. *epaktos*, brought on, added). Number of days in the moon's age on Jan. 1. The excess of the solar year over the lunar is about 11 days. Should a new moon fall on Jan. 1, the epact of the ensuing year would be zero or 0. On Jan. 1 of the calendar year following the epact would be 11. The number is increased accordingly until, at the end of the lunar cycle, 19 years, the moon's aspects begin to be repeated. As the

moon's age cannot exceed 30 days, the epacts 0, 11, 22, are followed by 3. The epact was formerly used in calculating the date of Easter. See Calendar; Chronology; Lunar Cycle; Solar Cycle.

**Epaminondas** (c. 418–362 B.C.). Theban general and statesman. Although of aristocratic family, his early life was spent in poverty. He first came forward as a man of outstanding ability at the battle of Leuctra (371), when he was chiefly responsible for the great defeat inflicted on the Spartans which brought to an end the Spartan hegemony over Greece. Epaminondas determined to follow up his victory and to break the power of Sparta in Peloponnesus, her particular stronghold. With this object, he united the cities of Arcadia in a league, with the new city of Megalopolis, founded by himself, as the capital. As part of the same policy, Messenia, which had been for three centuries under the heel of Sparta, was made into an independent state. Dissension, however, arose in the new Arcadian league, some of its members inclining towards Sparta. In 362 the Spartans sent an army into Arcadia, which was defeated at the battle of Mantinea, but Epaminondas fell in the battle. During his lifetime, Epaminondas had raised Thebes to be the leading power of Greece, but its hegemony did not last after his death.

**Epaulette** (Fr., little shoulder). Fringed shoulder piece worn on full dress uniform by officers of the Royal Navy and on the great-coats of Royal Air Force officers and bearing the markings indicating rank. British naval epaulettes are of gold bullion with a fringe, and R.A.F. epaulettes are of cloth. Epaulettes were formerly worn by all ranks of the British army, but in 1855 they were abolished except for general officers' full dress uniform and for tropical uniform. They are worn by all ranks in certain foreign armies. The epaulette is a survival of the epaulière or metal shoulder-plate of medieval armour.

**Épée** (Fr., sword). French duelling and fencing sword. It weighs 1½ lb. and has a triangular blade 35 ins. long. It has no cutting edge and is used for thrusting only. The grip is 8 ins. long and is protected by a circular guard or shell. The

épée was first used in English fencing in 1900. It has given its name to a thrust or point in that sport. See Fencing.

**Épéhy**. Small town of France, in the dept. of Somme, 13 m. S.E. of Cambrai, with a station on the rly. from Calais to Paris. It figured prominently in the campaigns of the First Great War, being captured from the Germans by the British, April 1, 1917, and becoming the scene of heavy fighting in the German counter-attack after the battle of Cambrai, Nov., 1917. Retaken by the Germans early in their great final offensive of March, 1918, it fell to the British in Sept., 1918, in the so-called battle of Épéhy.

The Hindenburg Line lay little more than a mile to the E., and it was during the final Allied advance to that line that the battle developed. After initial operations to N. and S., the main attack, covered by a creeping barrage, was launched on Sept. 18 in heavy rain, by British troops of the 3rd and 4th armies, the Australian corps, and a corps of the 1st French army, on a front of over 25 m. By Sept. 25, after continuous heavy fighting and many casualties, all ground and positions needed for the Allied attack on the Hindenburg Line had been secured. The Australians had particularly distinguished themselves, breaking through an extent of 5,000 yds. of German front on the first day, and establishing themselves in the outer defences of the Hindenburg Line. German prisoners in the British section of the front numbered 11,750, and 100 guns were captured. In all, 14 British divisions opposed 15 German. The British success was the more notable in that the troops had been fighting almost continuously for seven weeks, suffering 72,000 casualties in that time.

**Épernay**. Town of France, in the dept. of Marne, about 19 m. W.N.W. of Châlons-sur-Marne.

Important industries include spinning, tanning, cork and cask making, and brewing, but above all the champagne industry, the wine being stored in cellars hollowed out of the chalk rock. In normal times about five million bottles are laid down annually. The town was occupied by the Germans early in the First Great War, and was one of the German objectives in the

Épernay arms

second battle of the Marne, July, 1918, when the assistance of the British divisions, Yorkshiremen and Highlanders, in the defence of Épernay, was specially recognized by Gen. Berthelot. Pop. 19,703. See Marne, Battles of the.

**Ephah.** In the O.T., name for the first in order of the sons of Midian (Gen. 25; 1 Chron. 1; Isaiah 60); concubine of Caleb in the line of Judah (1 Chron. 2); son of Jahdai (1 Chron. 2). The word, of Egyptian origin, was adopted as the name of a Hebrew dry measure which corresponded to the *bath* in liquid measure.

**Ephedra.** Genus of herbs. Under the name Ma Huang (astringent yellow), species of *Caleba* herb have been used as a medicine in China since ancient times. The genus belongs to the joint-fir family of gymnosperms, distinct species being distributed in the temperate and subtropical latitudes of Europe, Asia, and America, growing especially well in N. China, N. India, and Spain. The plants are mostly low, much branched, often procumbent, occasionally climbing shrubs, the green stems being collected for medicinal use. The chief constituents of *ephedra* are the alkaloids *ephedrine* and *pseudoephedrine*.

**Ephedrine.** Alkaloidal active principle ( $C_{10}H_{15}ON$ ) present in various species of *ephedra*. A synthetic preparation was evolved in 1927. It has a physiological action resembling that of *adrenalin* (*q.v.*), to which it is closely related chemically. Although isolated in pure form by the Japanese chemist Nagai in 1887, not until 1923, through the work of Chen and Schmidt, was the possible value of *ephedrine* as a therapeutic agent recognized and the substance made available for general use in the therapy of allergic diseases. *Ephedrine* has a more prolonged action than *adrenalin* and has the great advantage of being effective when given by mouth.

**Ephemera** OR MAY FLY (Order Ephemeroptera: Gr. *ephermos*, living a day; *pteron*, a wing). Insect with long slender abdomen, ending usually in three long bristle-like cerci. The eyes are large, antennae short, and the wings membranous and net-veined. The mouth-parts are aborted, no food being taken in the adult stage. The nymphs are all aquatic, breathing by lateral gills. The perfect insects are common about May; many kinds live but a few hours, and others survive days in favourable weather. About 40 species are

British. Fish rise readily to seize certain species, and at the time of the May fly anglers expect to secure exceptional catches by the use of fisherman's flies made in imitation of the natural creature.

**Ephemerides** (Gr. journals). Astronomical tables showing the predicted positions of a heavenly body for every day during a given period. When the elements of a planet's or comet's orbit are known an *ephemeris* can be calculated for its future position. Accurate *ephemerides* for the sun, moon, and planets are published in advance in the *Nautical Almanac*.

**Ephesians**, EPISTLE TO THE. The first of the group of Pauline epistles commonly known as the Epistles of the Captivity, because they seem to have been written probably between A.D. 61 and 63, during S. Paul's first imprisonment in Rome. It was probably intended to be a circular letter, and was not addressed particularly to the Ephesians. It contains no personal greetings to the friends of the apostle, and in the two best Greek MSS the words "in Ephesus" ("to the saints which are in Ephesus") are omitted. Moreover, Marcion speaks of it as the Epistle to the Laodiceans.

Its connexion with the Epistle to the Colossians is so close that the one is sometimes supposed to be an expansion of the other, but such a supposition is unnecessary. The external evidence for the authenticity of the epistle is sufficient, if not conclusive. As regards internal evidence, the fact that the language and thought differ somewhat from those of other Pauline epistles has caused difficulties, but these are by no means insuperable. The circumstances that impel a writer to take

up the pen, the mood in which he writes, are not always the same, and, in the interval between the writing of one epistle and another, the language and thought of S. Paul may have undergone considerable development as a result of his experiences.

**Ephesus.** Ancient city of Asia Minor, situated on the Cayster (Gr. *Kä-ystros*), near its mouth. It was the chief of the twelve Ionian colonies of Asia, and was founded probably about 1000 B.C. In the 6th century it fell, with the other Greek cities of Asia Minor, under the dominion of Croesus, king of Lydia, and later under that of Cyrus the Great, king of Persia. During the Athenian hegemony it paid tribute to Athens, but about the beginning of the 4th century B.C. it again passed under Persian rule. When Persia was overthrown by Alexander the Great, it acknowledged the Macedonian supremacy, and eventually, after the Roman conquest of Greece, became the administrative capital of the Roman province of Asia. Its fall was mainly owing to the silting of its harbours by the Cayster.

Ephesus was noted for the worship of Artemis or Diana; its temple to the goddess was regarded as one of the seven wonders of the ancient world. The city was visited by S. Paul on his second and third journeys, and was an early seat of Christianity. Ephesus was the birthplace of the philosopher Heraclitus. There are ruins of a theatre (Acts 19, 27), a stadium or racecourse, an odeum or hall in which musical and poetical contests took place, and the temple of Artemis. Consult Discoveries at Ephesus, J. T. Wood, 1877; Excavations at Ephesus, D. G. Hogarth, 1908.

Ephesus. Excavated ruins, looking towards the sea: in the foreground, ancient main street; in the distance, the prison of S. Paul, on the hill top

**Ephesus, COUNCILS OF.** Six important councils of the Church held between the 2nd and 5th centuries. The first took place A.D. 197, on the question of the date of the observance of Easter; and the second in 245, against the heresy of Noëtus.

The third council, 431, was the third oecumenical council of the Church, and dealt especially with the Nestorian controversy on the person of Christ (*see* Nestorians). Cyril, archbishop of Alexandria, had denounced Nestorius, and the emperors Theodosius and Valentinian convoked a general council to decide the matter. The council confirmed the Nicene Creed, condemned the heresy of Nestorius, and also settled certain points of discipline. The fourth council, 440, and the fifth, 447, met to decide a question of episcopal succession. The sixth or robber council, convened by Theodosius in 449, dealt with disputes about individual bishops and clergy, but its general findings were tainted by outside influences and were superseded by the council of Chalcedon in 451.

**Ephialtes** (d. 456 B.C.). Athenian statesman and democratic leader, who opposed Cimon (q.v.), the leader of the aristocratic party, and was associated with Pericles. Among the reforms of Ephialtes was the limitation of the power of the Areopagus. He is not to be confused with the traitor of the same name who, when Leonidas and his Spartans were defending the pass of Thermopylae in 480 B.C. against the Persians, showed the enemy a path whereby the defenders of the pass could be taken in the rear. In Greek mythology, Otus and Ephialtes were giants, who rebelled against the gods, and endeavoured to pile Ossa on Olympus and Pelion on Ossa. *Prom. Effi-alteez.*

**Ephod.** Symbolical waistcloth worn by the Jewish priests when officiating. That worn by the high

Ephod. Jewish high priest wearing the ephod, shown knotted below the breastplate

priest was of fine linen, coloured gold, blue, purple, and scarlet, worn over a blue robe, fastened round the body by a girdle, and supported by two shoulderstraps, each ornamented with an onyx stone inscribed with the names of six of the 12 tribes. Attached to the front of it was

the breastplate (q.v.). References are made in Exodus 28, 29, 39; Lev. 8; Judges 17; 1 Sam. 2 and 22; 2 Sam. 6.

**Ephor** (Gr. *ephoros*, overseer). Spartan official. Originally appointed by the kings to take over certain police and judicial duties, the ephors gradually became the most influential body in the state. After the second Messenian War (685-668 B.C.), they became an independent magistracy. Five in number, and elected by the Apella (the Spartan general assembly), they held office for a year. They possessed civil jurisdiction, looked after public morals, had the right of dismissing, fining, and imprisoning public servants, and even the kings were subject to their authority. Two of them accompanied the king in the field to keep a watch on his movements. They summoned and presided at the public assemblies, controlled the finances, and conducted negotiations with the representatives of foreign powers. When Agis IV tried to limit their authority, he was imprisoned by their order, and murdered (240). The ephorate was abolished by Cleomenes III, but restored after he lost the throne in 221, although it never recovered its former position. *See* Sparta.

**Ephraem Syrus** or **EPHRAIM THE SYRIAN** (c. 306-378). Theologian and sacred poet. A native of Nisibis, where he spent his youth in study, about the year 363 he removed to Edessa, where he lived the life of a hermit, and was ordained deacon. He devoted his life to teaching and writing, and assisted the poor during a great famine.

**Ephraim.** Second son of Joseph. With his brother, Manasseh, he was adopted by their grandfather Jacob, and their descendants were reckoned among the tribes of Israel. Ephraim took precedence of his elder brother Manasseh, but nothing is known of his personal career. The tribe of Ephraim occupied part of the northern territory of Palestine. Joshua belonged to this tribe.

**Ephrath** or **EPHRATHAH** (fruitful). Old name for Bethlehem (q.v.), in Palestine.

**Epi.** This is a French architectural term denoting a small finial (q.v.).

**Epiblast** (Gr. *epi*, on; *blastos*, shoot). Term used in embryology for the outer covering of the organism when it has reached the stage of a three-walled sac or gastrula. *See* Ectoderm.

**Epic** (Gr. *epos*, tale, song). Name given to narrative poetry which deals in dignified and elevated style with some important action,

usually heroic. The great examples are the Iliad and Odyssey of Homer, which are unmatched in any other language. Other peoples and later ages, however, produced poetry descriptive of great events to which the term epic has been generally and legitimately applied, such as the French Song of Roland and the English Beowulf. These all belong to the authentic, as distinguished from the literary, type, that is, they are "poems of growth," not the work of a single age or author, but stitched together by generations of bards from the myths and traditions of their race, embodied in older and more primitive lays and ballads. Such poems are important as historical documents. Though mingling fiction with fact, they preserve irreplaceable accounts of the manners and customs, and the political, social, and religious ideas of times otherwise unchronicled.

#### English Epics

Beowulf, for example, raises the curtain which hides the early life of our forefathers, and in its persons, scenes and episodes reveals many of the mental and moral characteristics of the race, as well as elements of the social order which still prevails in the British islands. Several other narratives which fall short, indeed, of the unity and completeness of the more famous heroic poems, still display many of their essential features, like the English Maldon, a splendid though comparatively late piece of the 11th or 12th century. Rhymed chronicles like Layamon's Brut partake of the epic character in that they contain fragments of actual history and are heroic in scope and intention, but deficient in plan and insufficiently elevated in style to bear comparison with the Iliad or Paradise Lost. Paradise Lost belongs, like Virgil's Aeneid or Tasso's Gerusalemme Liberata, to the artificial, invented or literary type. These are imitative poems, written in the epic manner by learned authors in epochs of advanced civilization. They are the works of bookmen, who describe events of which they had no personal knowledge and their value and interest rest wholly upon the imagination and poetical skill at work in their construction.

Few such attempts were greatly successful; nevertheless, since they followed the tradition and endeavoured to treat a noble subject worthily, they are properly to be styled epic. The Renaissance, on the other hand, produced many chivalric and romantic narratives, of epic dimensions certainly, like those of Ariosto and Spenser. Some are humorous, some serious, but

even when serious, and however charged with poetic quality—since they forsook the region of the heroic, of events that might have happened, for the region of the symbolic, marvellous, or incredible—have little in common with the true and original types. In the mock-heroic, like the classical *Batrachomyomachia*, or *Battle of the Frogs and Mice*, or *Pope's Rape of the Lock*, the manner and machinery of epic poetry are imitated, the great style applied to the trifling subject, with humorous intention or for the purposes of parody or burlesque. In modern times probably the nearest approach to the epic spirit is realized in *The Dynasts* of Thomas Hardy. See *Poetry*.

**Epicharmus** (c. 540–450 B.C.). Greek comic poet. Born in Cos, he went early to Megara in Sicily, but after its destruction in 483, he removed to Syracuse, where he enjoyed the patronage of the "tyrants" Gelo and Hiero. The chief representative of the Dorian or Sicilian comedy, his 35 plays written in the Doric dialect, of which only scanty fragments remain, dealt chiefly with mythological subjects (*Busiris*, the shipwrecked *Odysseus*, the *Sirens*). They were distinguished by rapidity of action, in which, according to *Horace*, they served as a model for *Plautus*.

**Epictetus**. Stoic philosopher who lived about 100 A.D. Born at Hierapolis in Phrygia, he was taken as a slave to Rome. Having been given his freedom, he became an adherent and teacher of Stoicism, and when Domitian expelled the philosophers from Rome, Epictetus removed to Nicopolis, in Epirus, where he lived until the reign of Hadrian. One of his pupils, Arrian the historian, published his *Discourses* and a *Manual* of his doctrines. The latter and four books of the *Discourses* are extant. According to Epictetus, we are only concerned with things that are under our control; all other things are *adiaphora* (indifferent). The good is that which corresponds to reason and the general moral ideas implanted in us; the bad is that which runs counter to them. The highest principles of life are patience, abstemiousness, and self-control. Epictetus assumed the existence of *daimonia*, spirits which, like that of Socrates, accompanied man everywhere and acted as his guardians through life.

**Epicureanism**. The doctrines of the school founded by the Greek philosopher Epicurus (341–270 B.C.). He was of Athenian parent-

age, and born in Samos. Coming to Athens, he founded his school in his Garden, which became as famous as the Stoic Porch about 306. Epicurus divided philosophy into three parts: *Canonic* (logic, the theory of knowledge), *Physics*, and *Ethics*. The basis of all knowledge is the evidence of sensual perception; all perceptions are true and irrefutable. Opinions are true or false,

greater circle. In Ptolemy's system of the heavens each of the "seven planets" was supposed to revolve in an epicycle. This obsolete explanation describes with approximate truth the relative motion of a planet with regard to the earth, if the earth is assumed to be stationary.

**Epidaurus**. Town of Argolis, ancient Greece, situated on the Saronic Gulf. It was famous for its

Epidaurus, Greece. Although this theatre dates from the 4th cent. B.C., nearly every one of the 16,000 stone seats is still in position; the foundations of the stage buildings are seen beyond the circular orchestra.

according as they are confirmed or refuted by perception.

In physics Epicurus agrees in the main with Democritus, the founder of the atomic theory. Bodies are formed by the collision and combination of an infinite number of atoms in infinite space. The number of worlds also is infinite. The gods, made of the finest atoms, do not trouble about the world or human affairs, but live happily in the empty spaces between the different worlds. The soul is material, made up of the finest atoms dispersed throughout the body. There is no such thing as immortality; after death the soul-atoms are scattered. Sensation is due to effluxes and images, which issue from the surface of things and pass through the air to the sight or understanding.

In ethics Epicurus follows the Cyrenaics. Pleasure is the aim of life, the only happiness. No pleasure is bad in itself, but only pleasure in rest—freedom from pain—is a true good. The virtuous man, he who rightly pursues pleasure, is alone happy.

Epicureanism is used today of addition to sensual enjoyment, more particularly that of the table. See *Ethics*; *Philosophy*.

**Epicycle** (Gr. *epi*, upon; *kyklos*, circle). A circle, the centre of which moves along the circumference of a

temple of Asclepius (*Aesculapius*), the god of healing, about 8 m. distant, which was extensively visited by the sick from all parts of Greece. Miraculous cures similar to those at Lourdes are recorded. Excavations carried on since 1881 have revealed remains of the temples of Asclepius and Artemis, of a tholos or rotunda, and inscriptions connected with the worship of Asclepius. Outside the sacred precincts is the loveliest and best preserved of the theatres of classic Greece. It was designed by the younger Polyclitus (4th cent. B.C.). The original fully circular orchestra is still visible. The auditorium seated at least 16,000 people, and the acoustics were so good that a performer speaking in ordinary tones could be heard from every seat in the auditorium.

**Epidemic** (Gr. *epi*, in; *dēmos*, people). Occurrence of a disease among a number of persons about the same time. When a disease is continually present in a locality the term endemic is applied to it. A pandemic is an outbreak of a disease which extends over the whole or a large part of the world. In the Middle Ages, when sanitation was non-existent, epidemics were of frequent occurrence and were usually regarded as manifestations of divine wrath. Later the communicability of the disease from one

person to another was recognized, and the cause of the outbreak was looked for in climatic occurrences or cosmic phenomena—for example, the influence of a comet.

In the 18th and 19th centuries more scientific views were gradually established, and it was recognized that the disease was conveyed from one to another by some morbid or poisonous agent, which was eventually found in most cases to be a bacillus or other micro-organism. Epidemics are spread by various agencies. Pollution of drinking water by sewage has been the commonest cause of outbreaks of cholera and typhoid fever. Epidemics of diphtheria have frequently been spread by contaminated milk. In other cases insects or animals have been the transmitting agent. Typhus fever, for example, is conveyed by the bite of the louse, and plague by the rat flea. Airborne infection has been confirmed as the method of transmission of influenza, of scarlet fever, and of smallpox. Epidemics may also be caused by wholesale contamination of food with poisonous substances. In 1900 there was an epidemic of arsenical poisoning in the N. of England due to the contamination of beer with arsenic derived originally from arsenical iron pyrites from which sulphuric acid used in the manufacture of the beer had been made. Epidemics of lead poisoning have also followed the contamination of drinking water by lead derived from cisterns and conduit pipes.

The prevention and arrest of epidemics necessitate active measures which vary with the particular circumstances controlling the disease. Some system of notification of affected persons, followed by their isolation, is important. This is possible only in advanced communities and where the severity of the disease justifies the course and the numbers are not too great to cope with. It could be followed in Great Britain during outbreaks of smallpox, but would be a difficult matter with influenza. Public health is now an important department of medicine, dealing with preventive measures against widespread outbreak of disease, and limiting such an outbreak should it occur. See Plague; Public Health.

**Epidendrum** (Gr. *epi*, on; *dentron*, tree). Large genus, mainly

of epiphytes, of the family Orchidaceae. They are natives chiefly of S. and Central America and the W. Indies. They have leathery, strap-shaped leaves, and

**Epidendrum.** Typical flower bud and leaves

flowers solitary or disposed in spikes or sprays. The characteristic features of the genus are the union (more or less complete in different species) of the fleshy base of the lip to the column, a passage at the base of the lip, and the four compressed pollen-masses. Some of them have handsome flowers, but in many species these are of a dingy green hue.

**Epidermis** (Gr. *epi*, on; *derma*, skin). Name for the superficial layer of the skin, lying above the *cutis vera* or true skin. It is formed by a number of layers of cells, the most superficial of which consist of stratified epithelium, and are horny in character. These form the thickest part of the epidermis. Beneath the horny layers are several layers of clear rounded cells forming the *stratum lucidum*; next is a layer of granular cells, the *stratum granulosum*. In these strata the change from protoplasm to horny material takes place. The deepest layers constitute the *rete mucosum* or Malpighian layer, and consist of soft protoplasmic cells. The epidermis grows from the deeper layers, the superficial horny cells being continually shed. It has no blood vessels, but fine nerves ramify in the deeper layers. The term is used also for the cuticularised superficial cell layer in plants. See Skin.

**Epidiascope** (Gr. *epi*, on; *dia*, through; *skopein*, to look). Apparatus of the optical lantern type. Originally intended for projecting on to a screen images of opaque bodies such as insects, coins, diagrams, etc., in their natural colours, it can also be used for projecting transparent objects; e.g. lantern slides and microscopic preparations can be shown with considerable magnification. The illumination is provided by lamps located at the focus of parabolic mirrors; the light is thrown upon, or transmitted through, the object by a system of condensers and mirrors. An epidiascope enlarger is used in the dark room for making photographic prints from negatives on opaque substances.

**Epididymis** (Gr. *epi*, on; *didymos*, testicle). In anatomy, a convoluted tube which receives the

ducts from the testis, and is prolonged into a tube, the *vas deferens*, through which the seminal fluid passes to the urethra.

**Epidiorite.** Crystalline rock derived by metamorphism from basalt or dolerite. By alteration original augite is converted to hornblende, and the rock assumes the general mineral assemblage of a diorite (*q.v.*). Epidote, chlorite, sphene, and quartz are usually present as secondary minerals. It is common in the Scottish Highlands and other areas composed of ancient metamorphosed rocks.

**Epidote.** Basic silicate of calcium and aluminium. It is found abundantly, but outside Austria and America is rarely of sufficient transparency and fine colour to be cut as a precious stone. The colour ranges from green to brown. Its specific gravity is from 3.25 to 3.5. Piedmontite is a manganese epidote originally found in Piedmont, some valued specimens being characterised by a magnificent cherry-colour. Epidote is formed by metamorphism of lime-rich rocks.

**Epiglottis** (Gr. *epi*, on; *glossa*, glotta, tongue). Thin leaf-shaped structure, consisting of fibro-cartilage, placed behind the root of the tongue and in front of the superior opening of the larynx. It was

formerly supposed that it was bent back during the act of swallowing and served as a lid to close the larynx; but it is now recognized that the closing of the glottis is effected by the arytenoid and thyro-arytenoid muscles.

**Epigoni** (Gr., descendants).

In Greek legend, the sons of the seven heroes who fell in the war against Thebes. See Adrastus.

**Epigram** (Gr. *epi*, upon; *gramma*, a writing). Originally a simple inscription attached to religious offerings. It was afterwards written on the temple gate, and by easy tradition passed to other public edifices and to statues of gods, heroes, and all who had dis-

**Epiglottis** seen from the front. Upper picture, sectional diagram showing position of this structure in the throat

tinguished themselves by patriotism, courage, and virtue. The term at first included inscriptions in verse or prose, and the form was employed by legislators and philosophers to convey any political or moral precept, its brevity impressing it readily upon the memory. Finally, among the Greeks, the epigram came to signify any short piece of poetry which conveyed a single idea with neatness and grace. The Greek Anthology contains epigrams characterised by delicacy and truth of sentiment, and by elegance of expression, and entirely devoid of satire, play upon words, and even of conceit. Even in the lighter convivial epigrams the thought is generally of a melancholy cast, and the sepulchral inscriptions show simple delicacy and perfect appropriateness.

In the hands of the Latin epigrammatists the epigram acquired a new character. The term was now applied to any brief and concise composition in prose or verse, in which a single idea was expressed and the point made by antithesis, surprise, or play upon words. Catullus and Martial are the acknowledged masters of the Latin verse epigram, Tacitus of its prose equivalent. Despite much conceit and some obscenity Catullus excelled all other Roman wits in elegance and beauty, while Martial stands supreme in wit and fecundity, in brevity, smartness, and variety. As used by Martial, and in the modern sense, the verse epigram has been defined as a short poem, generally of a personal character, meant to vex somebody, to pay off an old score, or to be smart at someone else's expense. In the best examples the point is made unexpectedly in the last word, wherefore the epigram has been compared to the scorpion because "as the sting of the scorpion lyeth in the tail, so the force and virtue of the epigram is in the conclusion."

#### Modern Writers of Epigrams

Of modern literatures the Italian contains the nearest approximations to the Greek epigram in respect of feeling, though not of simplicity, in the softly melodious, elegant, and pathetic songs of Metastasio and the amatory verse of Guarini, Tasso, and others. Pananti, in the early 19th century, wrote epigrams notable for their causticity, political allusion, and boldness. The French madrigal is sometimes written in the spirit of ancient Greece, and is often unequalled in condensation of thought, happiness of epithet, and

delicacy of turn. Voltaire, however, is the supreme French epigrammatist, writing on every conceivable subject and with every degree of merit.

English literature is deficient in the serious and tender style of epigram, but singularly rich in the witty and satirical. The 18th century was the flowering time of the English verse epigram, which was admirably suited to the malicious wit of Pope, the whole of whose poetry, indeed, is a string of epigrams. As epigrammatist, he stands head and shoulders above all other English poets. Owing to their vagueness and inappropriateness, his epitaphs are notoriously bad, but his epigrams are of the highest polish and point. His epigram on epitaphs, addressed to Dr. Robert Freind, headmaster of Westminster School, runs thus:

Freind, for your epitaphs I'm grieved;  
Where still so much is said,  
One half will never be believed,  
The other never read.

**Epigraphy** (Gr. *epi*, on; *graphein*, to write). Study of inscriptions. In practice it concentrates upon inscriptions on durable materials such as stone, metal, and wood, including coins, gems, ornaments, seals, vases, and weapons, whereas palaeography studies the forms of writing upon papyrus, parchment, and paper. When concerned with form it is a branch of palaeography, but in addition it deals with subject-matter. Important departments are Chinese, Greek, Hittite, Latin, Indian, Runic, and Semitic epigraphy. See Inscriptions; Palaeography.

**Epilepsy** or **FALLING SICKNESS** (Gr. *epilepsis*, seizure). Disease of the nervous system characterised by periods of unconsciousness. Two forms are recognized: *petit mal*, or minor epilepsy, in which convulsions do not occur; and *grand mal*, or major epilepsy, marked by the occurrence of convulsions or fits. Epilepsy may begin before the fifth year; first indication of the disease after thirty is less common. The fundamental cause is unknown, though fright, injury, and an attack of illness sometimes appear to be exciting causes. Hereditary influences play a part, the offspring of those who suffer from insanity or neurasthenia being rather more prone to exhibit epilepsy than other children. In *petit mal* the attacks of unconsciousness often last no longer than a few seconds. The individual may suddenly stop talking and his eyes stare fixedly; after a few moments he resumes his talk as if nothing had happened.

*Grand mal* is characterised by the occurrence of convulsive fits. In many cases the subject has a preliminary sensation or *aura*, which warns him of what is going to happen. This may take the form of tingling or sensation of heat or cold in the limbs or face, flashes of light before the eyes, noises or voices in the ears, or uneasy sensations in the stomach. After an interval of varying duration the patient suddenly loses consciousness, and may fall to the ground without making any effort to save himself. Sometimes the beginning of the fit is marked by a loud cry. At first the muscles are rigid; the jaws are clenched, the limbs extended, and suspension of respiration causes blueness of the face. After a few seconds, violent convulsions occur; the limbs are jerked about, the muscles of the face twitch, and the tongue may be severely bitten. After one or two minutes the patient passes into a state of coma which may be succeeded by prolonged sleep. In severe cases fits may rapidly follow each other, and consciousness may not be regained in the intervals.

#### Variant Forms of the Disease

Masked epilepsy is a form in which the fits are replaced by attacks of delirium or outbursts of maniacal fury, during which the sufferer may commit crimes of brutal violence or destroy himself. In another form there is loss of memory. A person may leave his home and wander about the country, behaving like a normal being, but having forgotten his previous life or even his name. After an interval his old self returns and he has no knowledge of what has happened in the interval.

Jacksonian epilepsy is a condition in which consciousness is not lost, and the spasms affect only part of the body. The condition is probably quite distinct from true epilepsy; it is the result of some irritation of the brain, and may be due to injury.

In epilepsy, characteristic electrical discharges occur in the brain. These can be recorded on the electro-encephalogram, an instrument used in diagnosis.

During an actual fit all that can be done is to prevent the patient from hurting himself. He should be allowed to remain in the recumbent posture, the clothes should be loosened round the neck, and a roll of cloth should be introduced between the teeth to prevent the tongue from being bitten.

The most useful drugs in the treatment of epilepsy are the bromides of sodium and potassium and the phenobarbitone family. These should be given for possibly two years, the amount and frequency of the dose depending upon the severity of the condition, the age of the patient, and the manner in which he reacts to treatment. Enough should be given to ward off recurrent attacks, which weaken mental power.

Épinal, France. The town, looking up the Moselle towards the wooded Vosges Mountains

An epileptic should lead a quiet life. He should not take alcohol; and his meals should be light and moderate. It is better for the patient to be at work or occupied, provided the occupation is not one which subjects him to danger if a fit occurs. When epilepsy develops, a thorough examination should be made in order to eliminate any possible sources of reflex irritation such as adenoids, worms in the intestine, etc.

**Epilogue** (Gr. *epilogos*, conclusion, peroration). Short address in prose or verse frequently employed to round off a dramatic performance; sometimes in the form of an appeal to public favour for the play it followed, sometimes explanatory or even apologetic. Many of the plays of Shakespeare and other great dramatists were provided with epilogues. In the 17th and 18th centuries the epilogue was frequently written by a friend or patron of the playwright. The use of the epilogue, as of the prologue, went out of fashion before the close of the 19th century, except on special occasions. The term was adopted by the B.B.C. for a short Sunday evening service of texts and singing, first broadcast in 1926.

**Epimenides**. Greek legendary priest and miracle-worker. A native of Crete and associated with the worship of the Cretan Zeus and Apollo, he was summoned to

Athens in 596 B.C. to purify the city from the curse of Cylon (see Alcmaeonidae). He was the author of oracular and purificatory poems, and is supposed to be the "prophet" of St. Paul's epistle to Titus (1, v. 12), according to whom the Cretans were "always liars." Some regard him as an entirely mythical character. *Pron.* Epipi-menni-deez.

**Épinal**. Town of France. The capital of the dept. of Vosges, it is situated on both sides of the Moselle, 190 m. E.S.E. of Paris. It makes embroidery, hats, images, and has long been noted for the production of pictures for children. It has extensive quays and promenades. With Belfort, Verdun, and Toul it formed, during the First Great War, the first line of French permanent defences along the lines of the Moselle and the Meuse. The fortress of Épinal was built after the Franco-Prussian War, and was one of France's most important works of defence. There is a monument to the French who fell in the war of 1870-71. A 12th century tower is preserved as part of the church of St. Maurice. The town has been French since 1766. Pop. 23,395.

**Épinay**, LOUISE FLORENCE PÉTRONILLE D'ESCLAVELLES D' (1726-83). French author. Born at Valenciennes,

Louise d'Épinay,  
French author  
After Liotard

March 11, 1726, she married in 1745 her cousin Denis de la Live de Bellegarde, who soon afterwards deserted her. Her charm and literary ability made her many friends among writers of her day, J. J. Rousseau, Voltaire, Diderot, and Grimm among others. For Rousseau she built in 1756 the Hermitage, in the valley of Montmorency; the story of their intimacy is told in his Confessions, but after little more than a year they quarrelled. She died April 17, 1783.

Her chief writings were her *Mémoires*, published in 1818, a lively picture of her literary circle

and Parisian society, the names being fictitious, and her *Conversations d'Émilie*, 1774, crowned by the French Academy, 1783.

**Epiphany** (Gr. *epiphainein*, to manifest). Festival of the Christian Church, celebrated on Jan. 6. The English Prayer Book title is The Epiphany, or The Manifestation of Christ to the Gentiles. Formerly the Epiphany seems to have been part of the festival of Christmas, which lasted twelve days. It commemorated the manifestation of Christ's birth to the Magi (which in medieval times was associated with a mass of picturesque legends), the manifestation of the Trinity at Christ's baptism, and Christ's first miracle at Cana.

In the Greek Church the festival is a special day for baptism.

In England on this day it was customary for the sovereign to offer gold, frankincense, and myrrh at the altar. Since the time of George III this offering has been made at the Chapel Royal, St. James's, by an officer of the royal household. *See* Calendar; Twelfth Day.

**Epiphora** (Gr., bringing upon, sudden attack). Persistent overflow of tears down the cheek, usually due to obstruction of the lachrymal duct. *See* Lachrymal Gland and Duct.

**Epiphyllum** (Gr. *epi*, on; *phylon*, leaf). Small genus of climbing sub-shrubs, members of the family

Epiphyllum. Fleshy branches and flowers of *Epiphyllum truncatum*, a Brazilian cactus

Cactaceae. They are natives of Brazil. They have thin cylindrical stems, 2 ft. or 3 ft. high, with short, fleshy, leaf-like branches, whose broad ends produce large, showy flowers of pink or crimson hue.

**Epiphysis** (Gr., on-growth). Part of a bone which develops from a separate centre of ossification and is at first attached to the main part of the bone by cartilage, which ultimately is replaced by bone. In the humerus, or upper arm bone, for instance, the upper end forms an epiphysis which is not united to the shaft by bony union until about the 20th year, and the lower end is another epiphysis which unites about the 16th. *See* Arm; Elbow.

**Epiphytes** (Gr. *epi*, on; *phyton*, plant). Plants which, instead of being rooted in the soil, grow upon the surface of other plants, chiefly trees. Large numbers of the tropical orchids are of this character, and are therefore known as epiphytic orchids. Some ferns and mosses have the same habit. True epiphytes do not derive any of their nutriment from their hosts, and are often called air-plants.

**Epirus** (Gr. *ēpeiros*, mainland). Country in the N.W. of ancient Greece. It was bounded by Illyria, Macedonia, and Thessaly on the N. and E., and by the Ionian Sea on the W. The original inhabitants were so-called Pelasgians, like those in other parts of Greece, but the Epirotes of historical times were a mixed race. The most famous king of later times was Pyrrhus (d. 272 B.C.), who seriously challenged the power of Rome. In Epirus was the celebrated oracle of Zeus at Dodona.

The modern district of Epirus extends from N.W. Greece into

S. Albania. It covers an area of 3,688 sq. m. and had a pre-war pop. of 363,041. In Epirus during the Second Great War the Greeks defeated Italian forces in Oct.-Nov., 1940, and resisted the Germans from the invasion in April, 1941, until the territory was liberated in Nov., 1944.

Episcia. Foliage and bloom of this Central American plant

**Episcia.** Genus of perennial herbs, members of the family Gesneriaceae. Natives of Central America and the West Indies, they have opposite leaves and beautiful funnel-shaped flowers. In colour they are white, flesh-tinted, lilac, vermilion, or crimson.

logy (contrast the Eastern Orthodox and Anglican view, according to which the three "orders" of the ministry are those of bishops, priests, and deacons), bishops and presbyters, notwithstanding the fact that bishops are specifically "consecrated" as such and hold authority over the presbyters, are reckoned as together constituting the single "order" of priesthood, the other two sacred "orders" of the ministry, according to the R.C. reckoning, being those of deacon and sub-deacon.

Whatever may have been the precise functions of "bishops" in the earliest period of all, and whether or not they were differentiated in any specific fashion from "presbyters," they appear in the N.T. as ministers of local "churches," holding office in subordination to the general oversight of the apostle or other "missionary" by whom their "church" had been founded. The second Christian generation inevitably found the local "churches" deprived of such supervision by "apostles" or "missionaries." The local "bishops" succeeded no less inevitably to many of the functions of the original "apostles." They were the local rulers of the church, administered its discipline (probably with the help of the presbyters), were its principal teachers, and were the normal ministers of its sacraments and leaders of its worship.

#### Church Rule in the 2nd Century

The system reflected in the epistles of S. Ignatius (an early 2nd century martyr-bishop from Antioch in Asia Minor) quickly became universal. At the head of each local church there was a bishop, who in the general control of the church was assisted by presbyters. At the church's assembly for worship the bishop presided at the Eucharist, flanked by presbyters upon either side, and assisted by deacons. "Nothing apart from the bishop" is the slogan of these epistles: if the bishop himself was not able to preside at the Eucharist, the celebrant must be someone deputed by him—presumably one of the presbyters. At the stage represented by the Ignatian letters, the local church in each city was probably still small enough numerically to be assembled together for worship in one "congregation." As numbers grew, and the bishop's "diocese" (a word which means literally "sphere of administration") expanded, the formation of branch congregations would be inevitable; presbyters were put

## EPISCOPACY: CHURCH RULE BY BISHOPS

Rt. Rev. A. E. John Rawlinson, D.D., Lord Bishop of Derby

*The origin in earliest Christian times and the subsequent development of the system of church government by bishops, found, with certain differences, in the Anglican, Eastern, and Roman Catholic communions, are here described. See Anglicanism; Church of England; Diocese; Roman Catholic Church, etc.*

The word episcopacy, meaning the system whereby spiritual authority and pastoral oversight in the Christian church is entrusted primarily to bishops, is derived from the Greek *episkopos*, one who exercises oversight. A distinction corresponding to the later distinction between clergy and laity existed in Christianity from the beginning, the original "ministry" of the church consisting of the apostles chosen by Christ. Other orders of ministers quickly began to emerge—in the N.T. there is reference to the appointment of "presbyters" (Acts 14) and to the existence of "bishops and deacons" (Phil. 1), though their respective functions cannot be precisely determined, and, originally, the chief pastoral oversight of the developing church was in the hands of the "Twelve" (the place of the traitor Judas having been filled, according to the narrative of Acts 1, by the appointment of Matthias), though an authority equal with theirs was conceded to S. Paul as the apostle to the Gentiles (Gal. 2; 1 Cor. 9) and apparently also to Barnabas, and a position of special importance was occupied also by James, the Lord's

brother (Acts 15, Gal. 1). The pastoral epistles (1 and 2 Timothy, and Titus) imply the exercise of authority over groups of local churches by their respective recipients, apparently as delegates left in charge by S. Paul. In 1 Timothy and in Titus, there are passages referring both to "bishops" (1 Tim. 3; Tit. 1) and to "presbyters" (1 Tim. 5: Tit. 1). It has been thought that in Tit. 1 "presbyter" and "bishop" may be two names for the same office; and, on the other hand, in 1 Tim. 5 the context suggests that the term "presbyter" (which means literally "an older man") is used in its etymological significance rather than as the designation of an office in the church (cf. Tit. 2, where, however, a variant term is used in the Greek original).

The view has been widely held that originally "presbyters" and "bishops" were the same (cf. Acts 20, v. 17 with 20, v. 28), or at least that, when the two were distinguished, the term "bishop" denoted simply a presbyter entrusted with special functions of "oversight" which his fellow-presbyters did not in all cases share. To this day, in R.C. theo-

in charge of them, with the result that many of the bishop's liturgical and other functions came to be habitually and normally shared by presbyters, who developed into what (to use a later term) might be called "parish priests," exercising a subordinate "cure of souls" under the bishop.

In the developed system of later centuries, the only liturgical functions exclusively reserved to the bishops were those of taking part in the consecration of fellow-bishops, ordaining men to the ministry (in the case of an ordination to the presbyterate or "priesthood," with the assistance of presbyters), and (in the Western part of the church) confirming or "sealing" the baptized. Yet the bishop of each diocese remained still the chief pastor of the church under his jurisdiction. His diocese might come to include numerous "parishes," he might have large numbers of clergy working under him, he might have an assistant bishop or bishops (commonly called "suffragan" bishops) to help him; but he remained still the one bishop of the diocese, the representative of his church in relation to neighbouring churches, and within his own area supreme.

#### The Unit of Church Government

In the countries surrounding the Mediterranean sea the normal area of a bishop's diocese has throughout the centuries continued to be quite small, each of the leading cities (and many quite small ones) becoming eventually the seat of a bishopric. In northern and western Europe, and (with the spread of Christian missions) in many other parts of the world, dioceses were as a rule (and still are) very much larger. Large or small, however, wherever episcopacy obtains, the diocese, under its bishop, remains the primary unit of the ordered life of the church. The grouping of dioceses into provinces, each under an archbishop, or (in the Eastern Church) into patriarchates, each under a patriarch, does not radically affect the truth of this generalisation, the powers of an archbishop or of a patriarch in relation to dioceses other than his own being of a strictly limited kind. Only in the R.C. Church (more especially since the adoption in 1870 of the constitution *Pastor Aeternus*) is the claim made that a particular bishop exercises, as the successor of S. Peter, a direct and immediate jurisdiction over all other bishops, and, indeed (according to the R.C. view), over all Christians everywhere.

In the 16th century the bishops in most countries affected by the movement of reform in the church refused their support to the Reformation, with the result that a breach with Rome was found to involve also a breach with the episcopate. Both in England and in Sweden an episcopate with continuous succession was maintained, but the succession elsewhere was broken. The (Lutheran) churches of Norway and Denmark have retained titular bishops, though with a broken continuity and without specific consecration to episcopal office; and the title and office of "bishop" (here also without continuity of succession) have been revived in some protestant areas of modern Germany, and by "Methodist Episcopalians" in the U.S.A.

#### Free Churches Reject Episcopacy

The majority of Protestant churches at the time of the Reformation adopted forms of church government in which no provision was made for episcopacy. In England the Puritan party in the church disliked and attacked the episcopal system and eventually seceded from the church. Their spiritual successors—the English "Free Churches"—have no bishops in their churches, and are traditionally hostile to episcopacy. Yet it is noteworthy that in quite recent times many of their leaders have come to recognize that, in any future scheme for church reunion, the acceptance of the episcopate as "the means whereby the authority of the whole church is given" to the ministers of the church at their ordination would be inevitable, and that "it ought to be accepted as such." So, too, in the proposed scheme for a united church of S. India it is laid down that the future church shall be organized in dioceses under the pastoral oversight of bishops.

In the Church of England, while there is an acceptance of episcopacy in practice, there are divergent views held as to its necessity. One school of thought maintains that in strictness the ordination of the clergy by bishops duly consecrated through a succession of ordinations and consecrations continuous with the church's past, and going back to the original days of the apostles, is essential for a "valid" and duly authorised ministry; another school, while regarding episcopacy as (upon the whole) the most desirable form of church government, would refuse to go further than this, or to regard as "invalid" (even in a technical sense) the ministries of churches

which do not possess or claim any "apostolic succession" based upon ordination at the hands of validly consecrated bishops.

*Bibliography.* Essays on the Early History of the Church and the Ministry, ed. H. B. Swete, 1918; The Church and the Ministry, C. Gore, revised C. H. Turner, 1919; The Doctrine of the Church and Reunion, A. C. Headlam, 1920; (for the Presbyterian view) The Church and the Ministry in the Early Centuries, T. M. Lindsay, 2nd ed., 1903.

**Episcopius**, SIMON (1583–1643). Dutch theologian whose family name was Bishop. He was born at Amsterdam, Jan. 1, 1583, and educated at Leyden, where he came under the influence of Arminius (*q.v.*). In 1612 he was appointed to a chair at Leyden university, and became recognized as the leader of the Arminians against the Calvinists. He took a prominent part in the synod of Dort in 1618, with the result that he was deprived of office and had to live for a time in France. About 1626 he returned to Holland, and became rector of the Remonstrant College at Amsterdam, where he died April 4, 1643. His *Confessio, Apologia pro Confessione, et Institutiones Theologicae* are the standard works on Arminianism.

**Episode** (Gr. *epi*, on, in addition; *eisodios*, coming in). (1) In ancient Greek tragedy, that part of the dialogue which comes between the choric songs. (2) In music, part of a composition in which some departure is made from the main theme, or form, for the sake of variety. In the fugue form, the episodes allow the use of fragments of the subject matter, varied treatment of the subject, entries at irregular intervals of time and pitch, and free changes of key. In sonata and rondo forms, episodes are of the nature of second subjects, but of less importance than the true second subject which appears again fully in the recapitulation section. (See Rondo; Sonata.) (3) In literary composition, a minor event or incident introduced to give variety to a narrative, or to illustrate a character or event. A story, for instance, is said to be episodic when it consists of loosely knit incidents, or where the incidents do not merge together in a natural succession and harmonious whole.

**Epistaxis** (Gr. *epi*, on; *stazein*, to drip). Bleeding from the nose. This may be caused by injury, by an unhealthy mucous membrane, or it may be associated with influenza or some of the fevers. Local congestion due to a diseased

tooth can give rise to obstinate nose bleeding. The cause of recurrent nose bleeding is often a small network of varicose veins in the nasal mucous membrane, and this answers immediately to treatment with an electric cautery. Simple nose bleeding is usually stopped by applying cold compresses over the nose and to the nape of the neck. The nose should not be blown. The bleeding nostril should be plugged.

**Epistemology** (Gr. *epistēmē*, knowledge; *logos*, theory) Theory or science of human knowledge. It investigates the origin and limits of knowledge; defines the part played in it by experience and thought respectively; and examines the formation, meaning, and employment of its fundamental notions.

**Epistle** (Gr. *epistolē*, message, letter). Term generally applied in English literature to verses written in the form of letters addressed to specific persons, or to readers generally, as in the epistle dedicatory. In the former sense it was a revival of the use of the epistle by Horace and other classical poets. Satiric or moral epistles, such as Pope's *Essay on Man* and *Moral Essays*, more or less on the Latin model, were a notable feature of English literature in the 18th century, at the close of which Burns gave the epistle an easier and freer form.

There are examples of epistles in the O.T. and in the O.T. apocryphal pseudepigraphic writings; but the famous letters or epistles of the Bible are confined to the N.T. The chief writer is the apostle Paul, to whom thirteen Epistles are ascribed. These are commonly divided into four groups (1) 1 and 2 Thessalonians, written from Corinth in A.D. 52 or 53. (2) Galatians, 1 and 2 Corinthians, and Romans, written in A.D. 57-58. (3) Ephesians, Philippians, Colossians, and the Epistles of the (first Roman) Captivity, written in A.D. 62 or 63. (4) 1 and 2 Timothy, Titus, the Pastoral Epistles, so called because they are addressed to two pastors and deal with matters relating to the ministry, written in A.D. 65. The so-called Epistle to the Hebrews does not claim to have been written by Paul, though ascribed to him in the Eastern and later in the Western Church, and the description Epistle is hardly correct. Its author is unknown. It seems to have been written between A.D. 75 and 85.

The rest of the N.T. Epistles are commonly known as General or Catholic Epistles, because they are apparently addressed to Christians in general. They are: James, Jude, 1 and 2 Peter, 1, 2 and 3 John. The author of the Epistle of

James may have been the brother of the Lord. Jude describes himself as "servant of Jesus Christ" and "brother of James." Peter is the famous apostle. The First Epistle of John is closely related to the Gospel of John. The Second and Third Epistles claim to be written by "the Elder."

**Epistolae Obscurorum Virorum** (Letters of Obscure Men). Series of satirical letters addressed to Ortwinus Gratius and called into existence by the Reuchlin-Dominican controversy. They played an important part in the Reformation, and have been many times reprinted. The first part, consisting of 41 letters, was published in 1515, seven more letters being added in the 3rd edition, 1516. The second part, comprising 62 fresh letters, appeared in 1517; its 2nd edition, same year, contained eight more. The two series were not published in one volume until 1556. Their authorship, long in doubt, was established by W. Brecht, who proved the principal writers of Parts 1 and 2 respectively to have been Johann Jäger, called Crotus Rubianus, and Ulrich von Hutten. *Consult* text, ed. with Eng. trans. F. G. Stokes, 1909; Die Verfasser der Epistolae obscurorum Virorum, W. Brecht, 1904. See Reuchlin, Johann.

**Epitaph** (Gr. *epi*, on; *taphos*, tomb or grave). Inscription on a tomb. The desire to record in lasting form the virtues or great deeds of the dead is universal, and has found expression in all ages. Some of the earliest extant epitaphs are found on Egyptian sarcophagi, and they were commonly used among the Jews. One of the most famous Greek epitaphs is that recorded by Herodotus as having been inscribed in honour of the Spartans who fell at Thermopylae: "Stranger, go tell the Lacedaemonians that we lie here obedient to their commands." Various anthologies and the catacombs of Rome supply numerous Greek and Latin examples.

Epitaphs vary infinitely in style, and reflect the literary taste of their age. In England they range from the lengthy recital of the deceased's titles and dignities in Latin and the solemn and elaborate survey of his career in the English of the eighteenth century to the severely simple and the frankly humorous. An effective Latin epitaph is that on Sir Christopher Wren in S. Paul's Cathedral, London. *Simon monumentum requiris. circumspice* (If you seek his monument, look around); while humorous epitaphs of the jesting sort frequently allude to differences between husband and

wife. Much ingenuity has been devoted to the play of words in epitaphs, e.g. in S. Benet, Paul's Wharf, London, is the following:

Here lies one More, and no more than he;  
One More and no more,—how can that be?  
Why, one More and no more may lie  
here alone;  
But here lies one more, and that's more  
than one.

Unconscious humour due to carelessness or ignorance is occasionally found, as on a tombstone at Ventnor:

Here lies the body of Samuel Young, who  
came here and died for the benefit of  
his health.

Frequently, however, epitaphs of the humorous kind are not genuine, being composed as a form of literary amusement. Some of fine quality come almost under the head of epigrams. Such are most of the epitaphs in Ben Jonson's works; for instance, the lines Underneath this sable hearse, and the beautiful tribute to Elizabeth L. H.:

Would'st thou hear what man can say  
In a little? Reader, stay.  
Underneath this stone, doth lie  
As much beauty as could die;  
Which in life did harbour give  
To more virtue than doth live:  
If at all she had a fault,  
Leave it buried in this vault.  
One name was Elizabeth.  
The other let it sleep with death;  
Fitter, what it died to tell,  
Than that it liv'd at all. Farewell.

**Epithalamium**. Nuptial song in praise of a newly wedded pair and invoking blessings on them, sung before the bridal chamber (Gr. *thalamos*). Fragments of Greek epithalamia by Anacreon, Pindar, and others have been preserved. One of the most celebrated by Latin poets is the epithalamium on Peleus and Thetis by Catullus. In English literature Spenser's Prothalamium and Epithalamium are among the most beautiful poems of this kind.

**Epithelioma**. Form of cancer in which the growth is mainly composed of cells pertaining to the epithelial or surface layer of the skin or mucous membrane. See Cancer.

**Epithelium** (Gr. *epi*, on; *thēlē*, nipple). Tissue composed almost entirely of cells with little cementing material. It forms the superficial layer of the skin and lines the internal cavities of the body. Pavement epithelium, consisting of one layer of cells fitted together like a mosaic, is found in the air-sacs of the lungs. Columnar epithelium lines the stomach and intestines. Stratified epithelium consisting of numerous layers of cells, covers the surface of the body. Ciliated epithelium is a form in which the surface of the cell carries a bunch of fine filaments having a continuous movement which sets up a current over the surface of the tissue. This form occurs in the air passages where the ciliary movement helps to clear the tissues of fine particles of foreign material and other debris.

**Epithermal Deposits.** Geological term used in the classification of ore deposits (after Lindgren). The large group of ore bodies genetically associated with igneous rock have been subdivided into several groups, according to the evidence of mineral association and geological relations. Epithermal deposits are considered to have formed from ascending thermal solutions at slight depth beneath the surface, generally at temperatures up to 200° C., pressures up to 100 atmospheres. Examples are found in the gold and silver deposits of Nevada, certain gold telluride veins, and the typical mercury deposits. Epithermal deposits frequently contain rich shoots (bonanzas) but rarely persist to great depth. It is, therefore, important for the mining engineer to know to which group his ore body belongs.

Epithermal deposits are generally associated with igneous lavas and dyke rocks, often andesite, latrite, trachyte, and rhyolite. The veins are characterised by crustification, brecciation, and open cavities. Wall rock alteration occurs, but much of the ore is confined to the vein. Short, irregular veins are the most common type. The metalliferous minerals may include those of gold, silver, mercury, base metals, tellurium, etc., while the common gangue minerals are quartz, calcite, barytes, fluorspar, adularia manganese minerals, etc.

**Epizoa.** Term for the animals which live parasitically upon, and are commonly attached to, the bodies of other animals. The term is most commonly used for those parasitic upon animals which are themselves parasitic.

**Epoch** (Gr. *epochē*, pause). In astronomy, the date on which the position of a moving celestial

object is specified. For planets and comets, the epoch usually given is that of the passage of the object through perihelion (*q.v.*). Even for the so-called fixed stars, catalogues are made for a specified epoch (e.g. 1875, 1950), so that by applying proper motion (*q.v.*) the position of any particular star can be found for any other time.

**Epode** (Gr. *epi*, on; *ōdē*, ode). Third part of the triple system of the Greek ode, which consisted of strophē, antistrophē, and epode. The term subsequently came to be loosely used in a wider significance, being applied to certain of the lyrics of Archilochus and his imitator Horace. *See* Ode.

**Eponym** (Gr. *epi*, on; *onoma*, name). Name of a real or fictitious person, the reputed founder of a country or people. Such are the mythical Brutus, from whom the name Britain is supposed to be derived, and Hellen, the traditional founder of the Hellenes or Greeks.

**Eponym Canon.** The Assyrian chronological table. The Sumerian identification of years by significant local events was simplified in Assyrian records by naming years after official personages in an orderly sequence. The word eponym is used after the analogy of the Greek archon (*q.v.*). The king was eponym in his first year, followed by his commander-in-chief, court officials, city governors, and others. Inaugurated in 1500 B.C. if not earlier, the canon hitherto recovered comprises fragmentary name-lists from Ashurbanipal's Nineveh library dated continuously from 893 to 666, and discontinuously from 911 to 640. From a supplementary list mentioning important events as well, an eclipse record was dated by astronomical calculation June 15, 763, thus fixing the whole series.

**Epping.** Market town and urban district of Essex. It stands on the summit of a hilly ridge, 382 ft. above sea level, near Epping Forest, 17 m. N.E. of London by railways and Green Line buses. The church of S. John Baptist (1832) was rebuilt in 1890 and superseded All Saints at Epping Upland as the parish church in 1889. Its tower was added in 1908. Epping has an agricultural trade. It gives its name to a division returning one member to parliament. Market day, Mon. Pop. 6,500.

**Epping Forest.** Stretch of wild woodland in Essex, England. All that remains of the old Royal Forest of Essex, known after the 13th century as the Forest of Waltham, it consists of about 6,800 acres between Leytonstone, S., and Epping, N., with Loughton, E., and Chingford, W., on high ground between the valleys of the Lea and Roding. The best of the wooded section includes Monkwood, N.W. of Loughton, and Epping Thicks, N.W. of Theydon Bois. Dark brown fallow deer run wild; a few small roe deer were introduced from Dorset in 1883. The last of the old red deer were removed to Windsor in 1827. Rabbits are numerous, and badgers, foxes, squirrels, and weasels are found.

While the pollarded hornbeam is a striking feature, there are a few aged oaks, and the beech, blackthorn, crab-apple, birch, willow, holly, and brushwood, together with gorse, broom, wild rose, and honeysuckle, lend charm and variety to the landscape. Of two ancient camps, Ambresbury Banks, 2 m. N. of Loughton, is popularly assigned to Queen Boadicea; and Loughton Camp, about 11 acres, to early British or pre-Roman origin. After protracted legal proceedings Epping Forest was secured to the public by the City Corporation and the Commons Preservation Society, at a cost of £250,000, and was opened by Queen Victoria, May 6, 1882. It is controlled by the City Corporation. A study of Epping Forest and its associations by W. Addison appeared in 1945.

**Epsom.** Market town forming with Ewell a borough of Surrey, England. It is situated 14 m. S.W. of London and is served by electric railway, bus, and Green Line. First known for its mineral springs accidentally discovered in 1618 by Henry Wicker when grazing his cattle, the town became a fashionable spa in the 17th century

**Epsom.** High Street of this Surrey market town, once a fashionable spa, but now best known for the race meetings on the adjacent downs

and was visited by royalty and London society, being especially popular about 1690. S. Martin's the parish church, has works by Flaxman and Chantrey. Epsom College is a public school, especially associated with the medical profession. Near the town is The Durdans, seat of a former Prime Minister, the 5th Earl Rosebery.

Epsom is world-famous for its race meetings held on the downs. Here the Derby, the Oaks, and other races are run and there are several large racing stables around. The town has some industries and gives its name to a division sending one member to parliament. Pop. est. 65,000.

**Epsom Salts.** Magnesium sulphate ( $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ ). It crystallises in small rhombic prisms, and forms a useful saline purgative.

**Epstein, JACOB** (b. 1880). British sculptor. Born of Russo-Polish parents in New York, Nov.

Jacob Epstein  
British sculptor

10, 1880, he lived in the U.S.A. until 1902, when he went to Paris to study at the Beaux Arts. Settling in London three years later, he designed 18 figures for the British Medical Association's building in the Strand in 1908. These aroused furious controversy, and were to establish his reputation as a sculptor whose inspiration deriving from works of the past was interpreted with a new and startling vision. Influenced by Rodin, African primitive sculpture, and statues of

Epstein. Portrait head in bronze, exhibited by the sculptor at the Leicester Galleries, London, 1947

Epstein's Lucifer, an over life-size bronze figure exhibited in 1945

the earliest Egyptian dynasties, Epstein's work was attacked not only for its austerity but for its revolutionary implications. In 1909 he designed the Oscar Wilde tomb in Paris. One of his most important works, the bas relief

Rima, erected in Hyde Park in 1925 as part of the birdsanctuary laid out as a memorial to W. H. Hudson, the nature writer provoked a storm of criticism, due chiefly to the distortion of the human figure. It was several times defaced. His other impressive works included the colossal figure groups of Night and Day at Broadway House, Westminster, 1928-29; Genesis, 1931; Ecce Homo, 1933; Consummation Est, 1937; Adam, 1939; Jacob and the Angel, 1942; all of which in one way or another challenged convention while they commanded respect. Apart from symbolic figures and groups, Epstein executed portrait busts in bronze, e.g. of Conrad, Rothermere, Shaw, Einstein, etc. As a painter his scenes of Epping Forest and his flower-pieces aroused interest. His work is represented in the Tate

Gallery, London, Brooklyn Museum, the Metropolitan Museum of Art, New York, etc. He wrote *The Sculptor Speaks*, 1931; *Let There be Sculpture*, 1940. See Art illus. p. 665.

**Epstein, MORTIMER** (1880-1946). British editor. Born of Jewish parents in Lithuania, he came to Great Britain as a child, and lived in Manchester. After being educated there, he studied at the Jewish theological college at Breslau, and later graduated at Heidelberg. Returning to England, he was economic adviser to several prominent commercial undertakings. In 1919 he became editor of the Statesman's Year Book, and in 1921 of the Annual Register (*q.v.*), retaining both positions until his death, June 23, 1946.

**Epworth.** Market town of Lincolnshire, England. It is on the Isle of Axholme, 9 m. N.N.W. of Gainsborough and 24 m. of Lincoln. It is famed as the birthplace

Epworth. Interior of the Wesley Memorial church built in 1889 to commemorate the birthplace of John Wesley

of John Wesley, whose father was rector here. The parish church's maple wood mazer was purchased by the British Museum, June, 1947. Pop. 1,795.

**Equaliser.** In engineering a bar which serves to equalise a pull or thrust, applied at an intermediate point equally between its two ends. See Compensating Beam.

**Equation** (Lat. *aequare*, to make equal). Statement of equality between two quantities. Thus  $19 + 6 = 25$  is an arithmetical equation. In algebra an equation is usually a statement involving known and unknown quantities,

the knowns being denoted by the earlier letters of the alphabet,  $a, b, c$ , and the unknowns by the later letters  $x, y, z$ .  $ax=b$  is a simple algebraic equation,  $x$  being the unknown quantity,  $a$  and  $b$  being supposed known. If  $a=6$  and  $b=42$  then  $x = \frac{b}{a} = \frac{42}{6} = 7$ .

Equations involving a number of unknowns,  $x, y, z$ , may form a system, and are then called simultaneous equations.

$$ax+by+cz=d$$

$$ex+fy+gz=h$$

$$kx+ly+mz=n$$

are simultaneous equations, and the problem is to find values of  $x, y$ , and  $z$  which will satisfy all three equations.

The degree of an equation is indicated by the highest power of one of its unknowns. Thus in the equation  $ax^2+by=c$  the highest power of the unknown  $x$  is 2, and the equation is said to be of the second degree. An equation which is true for any values whatever of the quantities concerned is called an identity, and the connecting symbol is usually three parallel straight lines:

$$x^2-y^2 \equiv (x-y)(x+y)$$

is an example.

There are as many solutions to an equation as the degree of the unknown. An equation of the second degree has two solutions, an equation of the third degree three, and so on. The methods of solving equations up to and including the fourth degree are well known, and it has been proved impossible to obtain the algebraic solutions of equations of a higher degree. The symbol  $\equiv$  was first used by Recorde (1510-58). See Algebra.

**CHEMICAL EQUATIONS.** The change which occurs in a chemical reaction is represented by formulae and symbols which show the distribution of the molecules of the reacting bodies before and after the change. The elements are represented by symbols and atomic weights, and the sum of the weights of the original substances equals the sum of the weights of the products of the reaction: hence the representation is termed an equation. Chemical equations merely express symbolically the verified results of the action of different molecules upon each other. Berthollet formulated the conditions as regards solutions as follows:

1. When two or more substances are brought together in solution, a substance will form and separate as a precipitate, if by any rearrange-

ment of the atoms a product can be formed which is insoluble in the liquid.

2. When two substances are brought together in solution, if a gaseous body or one that is volatile at the temperature of the experiment can form, it will escape as a gas or vapour.

For example: When silver nitrate solution and hydrochloric acid are mixed, the insoluble silver chloride is formed as a white precipitate (1); when vinegar is added to a solution of washing soda (sodium carbonate) a brisk effervescence results from the carbon dioxide given off (2).

The equation representing the formation of water ( $H_2O$ ) from its elements (hydrogen and oxygen) is written:

This equation symbolises the formation of two molecules of water from two molecules of hydrogen and one molecule of oxygen. The numbers beneath the symbols are the parts by weight of the elements involved in the reactions. The equation, however, does not tell us the conditions of the experiment; in this case a mere mixing of the gases does not result in a reaction, it is necessary to cause them to combine by means of an electric current.

As another example, the reaction between washing soda and vinegar may be used. Washing soda is sodium carbonate ( $Na_2CO_3$ ), with ten molecules of water of crystallisation which need not be shown in the equation. The acidity of vinegar is due to the acetic acid it contains. The formula for acetic acid can be written in several ways, e.g.  $HC_2H_3O_2$ ;  $C_2H_4O_2$ ;  $CH_3COOH$ ; or  $C_2H_3.OH$ . Taking the first expression as most suitable, we obtain the following equation:

On the right hand side results are shown, sodium acetate (which remains in solution), water, and carbon dioxide. We have thus accounted for the products of the reaction in accordance with the doctrine of the indestructibility of matter. The sums of the molecular weights on both sides are equal (rounded figures have been used), showing that all the atoms are accounted for.

In astronomy, an equation is a small correction added to or subtracted from a numerical quantity to compensate for a known irregularity or error. Thus, equation of

time, or personal equation, the correction applied to allow for a habitual inaccuracy of observation by a given person.

**Equation of Time.** A solar day is the interval which elapses between two successive passages of the sun over the meridian of a given place (e.g. London). Owing to the obliquity of the ecliptic to the equator, and to the varying velocity of the earth in its orbit, this interval is not always the same. Hence solar time differs from the mean solar time, registered by a perfectly even-going clock, constructed so as to record 24 hours to a mean solar day. There will be a difference between noon as registered by a sundial and as registered by the clock, and the difference will vary from day to day. This difference is called the equation of time, and is tabulated day by day in almanacs. Its maximum value is  $16\frac{1}{2}$  mins. about Nov. 3. See Horology.

**Equator** (Lat. *aequare*, to equalise). Circle drawn round the globe midway between the N. and S. poles. At the equator the sun is seen directly overhead at noon at the equinoxes. Latitude is measured N. and S. of this circle. It is the longest line, in one plane,

Equator. Perspective view of the earth, showing where the equator cuts Africa and a portion of S. America

that can be drawn round the earth, measuring approximately 24,902 m.

Strictly speaking, this line is the terrestrial equator. The great circle in which the plane of the terrestrial equator cuts the celestial sphere is called the celestial equator. The magnetic equator is that line drawn round the earth at any point on which the vertical components of the force of the earth's magnetism is zero. See Earth; Equinox; Latitude.

**Equatorial.** Telescope mounted and driven so as to follow the stars from rising to setting. The mounting consists of a polar axis, set

Equatorial Telescope mounted to enable the observer to follow the heavenly bodies across the sky  
By courtesy of T. Cooke & Son

parallel to the earth's axis in bearings so arranged that it can be rotated once in 24 hours by clock-work or electric motor. At right angles to this, a declination axis carries the telescope tube itself. The tube can be rotated by hand about the two axes until the telescope points to any desired star; the drive will then exactly counteract the effect of the earth's rotation and keep the telescope pointed towards the star indefinitely whilst observations are made. All big modern telescopes are mounted equatorially. The biggest, the 200-in. reflector on Mt. Palomar, Calif., has a cradle-type polar axis with the telescope tube slung within it between two declination bearings. With a solid upper bearing such as that of the 100-in. reflector at Mt. Wilson Observatory, the telescope cannot reach the polar regions. In lighter instruments such as the 72-in. reflector at Victoria, B.C., or the 40-in. refractor at the Yerkes Observatory, the declination axis carries the telescope at one end and a counterpoise weight at the other; this doubles the weight on the bearings, but is simpler to make and use. See Observatory; Telescope.

**Equatorial Africa, FRENCH.** Territory comprising Gabon (Gabon), Middle Congo colony, Ubangi-Shari, and Chad. Adjoining on the N.W. are French Cameroons; on the S., Belgian Congo; on the E., Anglo-Egyptian Sudan; on the N., Libya. French acquisition on the Gabon river began in 1839;

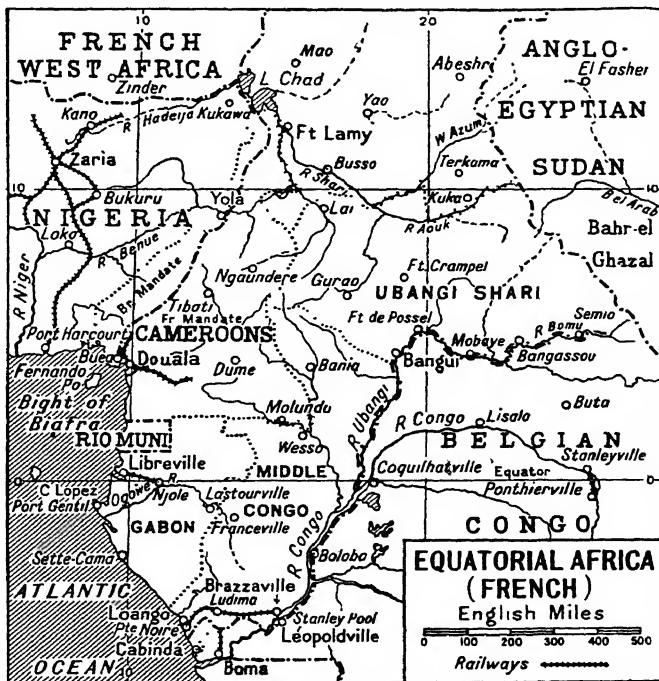

Libreville was founded in 1848, and Cape Lopez was gained in 1862. Since then the territories have been enlarged by exploration and military occupation, and their boundaries have been defined in a series of international conventions. By a decree of 1934, French Equatorial Africa was constituted a single administrative unit, the headquarters of the governor-general being at Brazzaville (*q.v.*). It was made a colony in 1941. The chief ports are Port Gentil, Libreville, and Pointe Noire. The principal products are cocoa, coffee, cotton, palm kernels, ground nuts, and timber; while copper, zinc, gold, lead, diamonds, corundum, and tantalum are found. Whale fishing is an industry. Area, 959,256 sq. m. Pop. 3,730,809.

This vast area broke with the Vichy government in Aug., 1940, during the Second Great War, and with British West and East Africa formed a block of Allied territory stretching across the continent and providing a vital life-line from Great Britain and the U.S.A. to the Middle East at a time when the Mediterranean was closed to the Allies. Roads were constructed, linking the Atlantic coast ports with Egypt and the Sudan, and air bases were built across the territory, making it possible for air-

craft to be ferried across Africa to the operational areas. The opening of the trans-Sahara road in May, 1943, linked French N. Africa with Chad. See Cameroons; Chad; Gabon; Ubangi Shari. Consult Exploration and Adventure in Equatorial Africa, P. B. du Chaillu, new ed. 1945.

**Equerry.** Originally an official of the royal stables. In the British royal household the equeries are army officers in the department of the master of the horse. The chief or crown equerry is a permanent official, who looks after the stables and stud. The sovereign always has an equerry in attendance. The form of the word, originally meaning stable (Fr. *écurie*, late Lat. *scuria*), has been influenced in English by a supposed connexion with Lat. *equus* (horse).

**Equidae** (Lat. *equus*, horse). Family of ungulate mammals, including the horses, asses, and zebras. In geological history, the horse family can be traced back to ancestors that had five toes instead of the single toe of modern horses. Phenacodus, a five-toed animal about the size of a bull-dog, lived at the beginning of the tertiary period. The next stage is seen in Hyracotherium, which was about the size of a fox, with four equal toes on the fore limbs, found in

Equatorial Africa, French. Map of territories which in 1934 were constituted a single administrative unit, and in 1941 were made a colony

lower Eocene strata. Succeeding stages are represented by Anchi-therium, with three toes and a diminutive fourth, in the Miocene age in Europe; Hipparion, with one large middle toe and two smaller side toes, in the Pliocene age; and Equus, two diminutive toes on each side of the large toe, in the Pliocene age. See Horse.

**Equilibrium** (Lat. *aequus*, equal; *libra*, balance). In a system of forces a state of equilibrium exists when the forces under consideration are so arranged that they balance or have no resultant at any point. A body is in stable equilibrium when it returns to its original position after being disturbed; in unstable equilibrium when it continues to move in the direction given to it by a disturbing force.

**CHEMICAL EQUILIBRIUM.** This is a balanced action between chemicals similar to that indicated by equilibrium in mechanics. It most closely resembles the mechanical equilibrium established when friction is large or inertia small, because in a chemical system there is nothing corresponding to the oscillations in mechanics. See Dynamics; Motion.

**Equilibrium Diagram.** This device of metallurgists is explained under Constitution Diagram.

**Equinoctial Gales** (Lat. *aequus*, equal; *nox*, night). Term indicating a belief that gales normally occur about the equinoxes. (*v. l.*). Actually, in N. America and Europe and over the N. Atlantic Ocean, winter is the period of most frequent and most intense gales.

**Equinox.** Dates on which the day and night are of equal length, and the length of day is the same for all parts of the world. Twice a year—at the vernal equinox, March 21, and at the autumnal equinox, Sept. 23—all places on the earth experience a day and a night each twelve hours long, the sun is vertically over points on the earth's equator, and it rises due E. and sets due W. everywhere.

The plane of the earth's equator infinitely produced cuts the celestial sphere in a fixed great circle which is called the celestial equator. At the points where the plane of the ediptic (*q. v.*) cuts the plane of the equator, or, more precisely, when the earth in its annual path is at these points, it will be so placed with regard to the sun that all over the earth day and night will be equal in length.

**Equisetaceae** (Lat. *equus*, horse; *seta*, bristle). Small family of Pteridophytes. It consists of

the single genus *Equisetum*—the horsetails. They are mostly natives of the N. temperate regions, but a few are sub-tropical. They have creeping rootstocks from which arise the erect, hollow, jointed stems, which are round and finely grooved. They are solid at the joints, which have toothed sheaths into which the next joint fits and from which the branches are given

Equisetaceae. Fertile and barren stems of the horsetail

off in whorls. The spores are produced on the undersides of scales of a terminal oval cone. *E. martii*, a native of Brazil, attains a height of 30 ft., but the other species are only a few feet high. The stems are covered with silica, and those of *E. hyemale* constitute the Dutch rushes of commerce, used for scouring and polishing.

**Equitable.** British life assurance company, in full the Equitable Life Assurance Society. Founded in 1762 as the Society for Equitable Assurance in Life and Survivorship, it is one of the oldest of the kind. In 1892 it was registered as a company. It is what is known as a mutual office, *i. e.* it has no shareholders, all profits after the payment of expenses going to policy holders. It has a controlling interest in the University Life Assurance Society and the Reversionary Interest Society. The head office is 19, Coleman Street, London, E.C.2

**Equitable Charge.** In English law, a charge on property which formerly was not enforced by a court of common law, but only by the court of chancery. Wherever the chancery court found an intention in a document that a sum of money should be secured on property, or paid out of it, the court would enforce it as a charge. For instance, if A owes B money, and gives B a letter saying "I will pay you out of the money due to me by C," this is a charge on C's debt, and the court will restrain C from paying the debt to A with-

out satisfying B's claim. Today all courts recognize and enforce equitable charges.

**Equitable Estate.** In English law the legal ownership of property may be vested in one person, and the equitable ownership in another. Thus a trustee is the legal owner of the trust property, but the beneficiaries have the equitable estate.

**Equites** (Lat., horsemen). In ancient Rome, originally citizens wealthy enough to support the expense of serving as horse soldiers. With lapse of time, as the citizen militia gave way to a paid army, the *equites*, conventionally translated knights, became merely a class in the state possessed of a certain amount of wealth, ranking below the senatorial order, but above the common people. As senators were forbidden to engage in trade, this equestrian order tended to be composed largely of merchants and other tradesmen.

The farming of taxes was an equestrian privilege, and at one time jury-men were exclusively drawn from the ranks of the knights. Under Augustus the order became more sharply defined; certain posts in the state service were reserved for them, the most important being the governorship of Egypt, the commissionership of corn supply, and the command of the fleet. The originally military associations of the equites survived only in state ceremonies. *Pron. ek-wit-eez.*

**Equity** (Lat. *aequitas*). Term used by English lawyers to describe that part of the law of England formerly enforced only by the court of chancery, and not by the common law courts. Equity was of two kinds: (1) where the court of chancery gave rights which the common law courts did not give; and (2) where chancery gave remedies which the common law knew nothing about.

Equitable rights unknown to the common law were numerous. The common law knew nothing of trusts and trustees. If a man had property conveyed to him, he was the legal owner, but if the property had been conveyed to him to be applied for the benefit of another, the chancellor would enforce the trust. The chancellor's jurisdiction was said to be founded on conscience. Gradually, side by side with the common law and sometimes conflicting with it, a great system of equity or chancery law grew up. When rights at common law and rights in equity did so conflict, the chancery court would grant an injunction to restrain the defendant

from exercising his legal rights—that is, from bringing or going on with a common law action to enforce those rights. Since the Judicature Act, 1873, all courts administer common law and equity side by side, so that such injunctions are now unnecessary.

Equitable remedies unknown to the common law were invented by the chancellors. The chief were the injunction and specific performance. The latter compels a man to carry out the contract he has made, and does not allow him to break it and pay damages. This jurisdiction was founded on the inadequacy of the remedy at common law, whose one and only panacea for every wrong and every breach of contract was damages. On the same principle the chancellor would grant an injunction to restrain a breach of contract, or the continuance of a wrong, or the commission of a threatened wrong, where damages would be an inadequate remedy. Thus, if I had a right of way over a footpath across A's field, and A stopped up the path, at common law I would get damages; but in equity I would have an injunction to restrain A from continuing to obstruct the path; and if A disobeyed, he would be attached. Equity, however, would not grant specific performance of every contract, or grant an injunction to prevent every wrong; but only when the remedy in damages was inadequate.

At common law there was no discovery, and, until comparatively recently, neither plaintiff nor defendant, nor anyone privy to them in blood or estate, was allowed to give evidence. This did not apply in the chancery court. So a common law plaintiff or defendant used to "file a bill" for discovery. That is, he made the other side answer on oath as to what documents he had in his possession. Also he could ask a long string of questions about the common law action, and compel the other side to answer them in writing and on oath. This procedure is now obsolete, as all courts, even county courts, have power to order discovery and interrogatories.

The principal subjects of the equitable jurisdiction are the enforcement and administration of trusts, the winding-up of partnerships; the administration of deceased persons' estates; the guardianship and property of infants; injunctions; the specific performance of contracts; the taking of accounts; the rectifica-

tion, setting aside, or cancellation of deeds or other written instruments, on the ground of mistake, misrepresentation, fraud, or undue influence; and the partition or sale of real estates.

At one time a court of equity could not award damages. They were reserved for the courts of common law. By the Judicature Act, 1873, however, all branches of the high court can now award damages in proper cases; though it is still unusual to bring an action for damages alone in the chancery division. *See Jurisprudence; Law.*

**Equity.** British actors' association. Founded 1930, and administered by a council elected annually, this organization promotes and protects the art of the theatre in all its branches and regulates the relations between actors and managers, agents, etc. Yearly fee £2 2s. The association has greatly improved the conditions prevailing in all branches of entertainment. By the end of 1943 the membership was approximately 5,500.

**Equuleus** (Lat., young horse). One of the Ptolemaic constellations. It is a small group of stars close by the head of Pegasus, so placed as to suggest that another horse is galloping by Pegasus.

**Era** or **AERA**. In chronology, a fixed point of time from which years and historical events are reckoned. Generally the date of some decisive occurrence in the history of the world, or of a particular people or individual, it also denotes the series of years reckoned therefrom. Important eras are: the Jewish, from 3761 B.C.; the Greek Olympiads, from 776 B.C.; the Roman, from 753 B.C., the traditional date of the foundation of Rome; the Babylonian, that of Nabonassar, 747 B.C.; the Spanish from 38 B.C., the conquest of Spain by Augustus; the Christian; the Mahomedan, 622. *See Chronology.*

Erased in heraldry

**Erased.** In heraldry, a charge, such as a head, a limb, a branch of a tree, shown with a jagged end. But a branch shown as torn off is generally said to be slipped if small, or snagged if large.

**Erasmus, DESIDERIUS** (1466–1536). Dutch humanist. He was probably born at Rotterdam, Oct. 28, 1466, the illegitimate son of Gerard de Praet of Gouda. For the name Gerard, meaning well-beloved, he afterwards substituted

the incorrect Latin and Greek equivalents, Desiderius Erasmus. After four years' schooling at Deventer, he was sent by his guardians to a seminary of the Brothers of the Common Life at Hertogenbosch (Bois-le-duc), and in 1486

After F. Penn in the Royal Collection at Windsor

entered the cloister of Stein and took the vows of the Augustinian order. In 1491 he became secretary to the bishop of Cambrai and a priest in 1492. After spending some time at the Collège Montaigu in Paris, he returned to Cambrai, but resumed his studies in Paris in 1496. At the same time he took pupils, one of whom, Lord Mountjoy, invited him to England.

Residing chiefly at Oxford, he became the friend of Thomas More and Colet, and received instruction in Greek from Grocyn and Linacre. He re-visited England in 1506 and 1509, the last time at the invitation of Fisher, bishop of Rochester and chancellor of Cambridge university. He taught Greek in Cambridge, and was appointed Lady Margaret professor of divinity. Between his visits to England and for some time afterwards he led a wandering life. During 1521–29 he was at Basel, where most of his works were published, and during 1529–35 at Freiburg, whence he returned to Basel and died July 12, 1536.

Of his editions of classical works the most important is Terence, 1532. *Adagia*, 1500, and *Apophthegmata*, 1531, contain maxims and anecdotes from classical authors, accompanied by moral reflections; *Ciceronianus*, 1528, is an attack upon the Italian school of Latin prose writers, who refused to admit any words or phrases not found in Cicero. He edited many of the Fathers of the Church, but his greatest service to

theology was his edition of the New Testament, 1516, the Greek text with a Latin translation, his treatment of which entitles him to be called the pioneer of Biblical criticism. The *Enchiridion Militis Christiani* (Dagger or Manual of the Christian soldier), 1502, is an attack on the inefficacy of formal religion. Other famous treatises are *Encomium Moriae* (Praise of Folly), 1509, a satire on clerical abuses and human follies, and *Colloquia*, 1516, specially a castigation of the vices of priests and others. Much of his correspondence throws light on the manners and customs of the England of his day.

Erasmus has been much criticised for the part he played in the Reformation and his attitude towards Luther. "Erasmus laid the egg and Luther hatched it," it was said. The truth is that Erasmus was a scholar, not a theologian; he was not the stuff of which religious zealots or martyrs are made. To use his own words, "I am afraid if I were put to the trial, I should imitate S. Peter." While conscious of the faults of Roman Catholicism, he always remained a Catholic, and while acknowledging the need of religious reform, he clearly saw the dangers that would inevitably follow extremist efforts in that direction. See Humanists: Renaissance.

**Bibliography.** Collected Works, ed. J. Clericus (Le Clerc), 10 vols., Leyden, 1703-06. Lives, by R. B. Drummond, 1873, R. C. Jebb, 1890, F. F. H. Capey, 1902; C. Hollis, 1933; S. Zweig, 1934; The Epistles of E. (to his 51st year), Eng. trans., F. M. Nichols, 1901-04; Opus Epistolarum Erasmi, ed. P. S. Allen, 1906; The Age of Erasmus, P. S. Allen, 1914.

**Erastianism.** Term specially applied to the view of Church policy which regarded the Church as mainly or solely a department of the State. Its upholders urged that while the choice and practice of religion was a matter for the individual conscience, the external organization of churches—including the appointment of ministers—was a function of the State. In a general sense, Erastianism means the doctrines of Thomas Erastus.

**Erastus, THOMAS** (1524-83). Swiss theologian. His family name was Lieber or Liebler, of which Erastus (beloved) is the Greek form. Born Sept. 7, 1524, at Baden, Switzerland, of peasant origin, he studied theology at Basel, and medicine and philosophy at Padua. In 1558 he became professor of medicine at Heidelberg, and later of ethics at Basel, where he died Dec. 31, 1583. A strong opponent of Calvinism, he upheld the Zwinglian doctrine. In a post-

humous work he maintained that offences of Christians should be punished by the civil power rather than the ecclesiastical. Consult Theses of Erastus touching Excommunication, Eng. trans. R. Lee, 1844. See Erastianism.

**Erasur** (Lat. *e*, out; *radere*, to scratch). Word meaning an obliteration, used mainly in connexion with written documents. In a legal document an erasure may be fatal to its validity, unless it can be proved that it was made before the document was executed. The parties concerned should initial the place where the erasure is made.

**- Eratosthenes** (c. 284-204 B.C.). Greek geographer, mathematician, astronomer, critic, and poet. Born at Cyrēnē, he studied at Alexandria and then at Athens, whence he was summoned in 235 by Ptolemy Euergetēs to take charge of the library at Alexandria, a post which he held until his death. His chief work, *Geographica*, was a treatise on physical, mathematical (based on his method of measuring the earth), and political geography. His mathematical works included a treatise *On Means*; the *Kosmion* (sieve) was a mechanical device for finding prime numbers. He also wrote an astronomical poem, *Hermes*, a description of the heavens and the mythological legends associated with the stars; a *Chronographia* or *Annals*; a valuable list of the victors in the Olympic games; and a history of old comedy.

**Erbium.** Metallic element of the rare earth erbia, which is its oxide. Its atomic weight has been determined as 167.7, and its specific gravity as 4.77, but while pure compounds have been prepared, the element has not yet been isolated. The oxide was first recognized in 1843. With dysprosium, holmium, and thulium it forms the erbia sub-group of rare earths, all of which are included in the yttrium group. Erbia is found in almost all the rare earths, but is most conveniently extracted from zenotime, fergusonite, euxenite, polychrase, and blomstrandin.

**Ercilla y Zúñiga, ALONSO DE** (1533-95). Spanish poet. He was a native of Madrid, and became attendant to Philip II, whom he accompanied to England in 1554. Ercilla fought in Chile against the Araucanians. The closing years of his life were lived in poverty and

neglect. His poems are mainly heroic, notably *La Araucana*, which embodied his war experiences.

**Erckmann-Chatrian.** Compound signature of two successful literary partners and collaborators. They were Émile Erckmann, born

May 20, 1822, at Phalsbourg, and Alexandre Chatrian, born Dec. 18, 1826, at Soldaten-thal, both in Lorraine. They began to collaborate in 1848, but first won success

Alexandre Chatrian,  
French author

in 1859 with *L'illustre Docteur Mathéus*. In 1862 they began, with *L'invasion: ou le tou Yégoï*, a series of novels which included *Histoire d'un Conscrit* and *Waterloo*, which remain among the best war stories ever written. Industrious playwrights, also in collaboration, they wrote *Le Juif Polonais* (Théâtre Cluny, June, 1869), fami-

liar in English to all playgoers as *The Bells*. Another of their plays, *L'ami Fritz*, 1876, retains its popularity in various modified forms. The collaboration was terminated by a difference of

opinion on money matters. Chatrian died in Paris, Sept. 4, 1890. Erckmann died at Lunéville, March 13, 1899.

**Ercole da Ferrara** (c. 1462-1531). Italian painter. Born at Ferrara, little is known of him

except that he was in the service of the Duke of Ferrara from 1492-99, and died in Ferrara in 1531. Among his best works, distinguished by the warmth of their colouring, are *The Madonna and Child*, and *Conversion of S. Paul* in the National Gallery, London. His real name appears to have been Ercole di Giulio Grandi, and his pictures have often been confounded with those of his fellow-townsmen and contemporary, Ercole di Roberti Grandi (c. 1455-96), probably his brother. The latter

By courtesy of Wm. Heinemann

was obviously influenced by Mantegna in his earlier work at Bologna: his second style, adopted after he settled in Ferrara in 1486, was more suave and graceful.

**Erebus** (Gr. *erebos*, darkness). In Greek mythology, son of Chaos and father of Hemera (Day) by union with his sister Nyx (Night). The word is sometimes used as equivalent to the lower world generally, sometimes for the region through which souls' passed on their way to Hades proper.

**Erebus**. Volcano of Ross Island, off S. Victoria Land, Antarctica, in lat.  $77^{\circ} 30' S$ . It has an alt. of 13,000 ft. Another volcanic peak, Mt. Terror (alt. 10,900 ft.), lies 30 m. farther E. They were discovered by Captain James Ross in 1841, who named them after his ships. Erebus has been active in recent times but Terror is dormant or extinct.

**Erech**. Biblical name of the Sumerian city Uruk. Its site is occupied by the modern village of Warka on the left Euphrates bank between Samawa and Shatrah, 138 m. S.S.E. of Bagdad, and its extensive ruins attest its former greatness. Mentioned in Gen. 10, the hegemony established by Lugalzaggisi (c. 2825 B.C.) was finally secured by Ur about 2450. Ashurbanipal deported to Samaria some of the inhabitants of Erech, the Archevites of Ezra 4. Loftus's excavations, 1854, revealed the temple and tower of its city-goddess Nana. Further excavations in 1913 brought to light relics of the Assyrian and Seleucid period.

**Erechthëum** (Gr. *Erechtheion*). Ionic temple on the Acropolis, Athens (q.v.), just N.W. of the Parthenon. It was built partly in honour of the Greek hero, Erechtheus, and contained the shrine and a sacred wooden image of Athena Polias, guardian of the city,

and the tomb of Cecrops, beside other treasures. A unique and beautiful structure, much of which is still standing, it is noted for its remarkable porch of the Caryatides (q.v.), six draped female figures supporting the roof. The original building was destroyed by the Persians in 480 B.C.; the new, begun about 437 or later, was much damaged by fire in 406, and was unfinished in 395.

See Athens.

**Erechtheus** or **ERICHTHONIUS**. In Greek mythology, legendary king of Athens. He was said to have been the founder of the great Athenian festival of the Panathenaea, and to have introduced the worship of Athena.

**Eregli**. Name of three Turkish towns, two in Asiatic Turkey and one in Thrace. (1) Port on the Black Sea, between the Bosphorus and Sinope, in Zonguldak vilayet. This was the ancient Heracleia, whence Xenophon's 10,000 Greeks set out on their return to Greece by sea. Sometimes called Banderegh, it is a busy place, with some ship-building and an export trade in silks, cattle, and coal. (2) Town in Konya vilayet, the ancient Cybistra. It stands on the Bagdad rly., halfway between Konya and Adana. There are remarkable Hittite remains in the neighbourhood. (3) Town of Thrace, on the European side of the Sea of Marmara, about 50 m. W.S.W. of Istanbul. It is also known as Eski Eregli and was the ancient Perinthus.

**Eremurus**. Genus of perennial herbs of the family Liliaceae. Natives of Asia, from S. Russia to Hindustan, they have fasciated roots, long slender leaves, and leafless flower stems terminating in a long spray of yellow, rosy, or white flowers, much like the hyacinth.

**Eretria**. Ancient city of Greece, on the W. coast of Euboea. It stood on the Euripus, 14 m. S.E. of Chalcis. It sided in 498 B.C. with the Greeks of Asia Minor against the Persians, who destroyed it eight years later. Rebuilt by the Athenians, it was the seat of a short-lived school of philosophy founded by Menedemus, whose tenets were akin to those of the Megarians. Eretria figured prominently in the war between Athens and Philip of Macedon. Recent excavations have revealed the remains of a theatre, an early temple, and other relics of the pre-Persian period. The site is now occupied by the swamp-bound town of Nea-Psara.

**Erewhon** OR **OVER THE RANGE**. Satire by Samuel Butler. One of the outstanding satires in English literature, this most popular of Butler's books was published 1872. When sheep farming in New Zealand, Butler wrote a sketch, Darwin Among the Machines (1863), and in this may be traced the germ of the imaginary country he depicts with such masterly incisiveness in the novel. In the manners and customs of Erewhon (nearly a reversed spelling of Nowhere), Butler satirised those of his own age; by placing the scenes and characters beyond time, he was able to draw a parallel with those of Victorian Britain. A sequel, Erewhon Revisited, notable for its humour, was published 1901.

**Erfurt**. A city of Germany. Largest town and chief economic centre of Thuringia, it stands 14 m. W. of Weimar, in the valley of the Gera, at the junction of many railways. Before the Second Great War its ancient buildings attracted tourists; the cathedral, dedicated to the Virgin Mary, mainly built in the 13th century, surrounded by towers of the old town, was one of the finest survivals of medieval architecture in Germany. There were 14 R.C. and 11 Protestant churches; the cathedral and neigh-

Erfurt. Left, Gothic cathedral church of Our Lady; right, the 15th century church of S. Severus

bouring church of S. Severus remained R.C. The former Augustine monastery where Luther lived, 1505-08, was turned into an orphanage, called in his honour Martinstift. The Predicants', Barefooted, and Augustine Friars' churches, now Protestant, date from the 13th and 14th centuries; and the university where Luther studied was built in 1392. The museum (1706) housed a unique collection of medieval art. Fortified until 1873, Erfurt's twin citadels dominated the city, the foundation of which dates from the pre-Charlemagne period, being made the seat of a bishopric by S. Boniface in 741.

Erfurt became an industrial centre early in the 19th century; it was famous for machinery, shoes, furniture, and rolling stock. Textile and chemical plants were developed; brewing and dyeing flourished, as did the flower seed trade. The former university influenced the whole of Germany from 1378 to 1806. Pop. (pre-war), 166,661.

During its early history Erfurt, though under the archbishop of Mainz, pursued an independent policy. The town council supported emperors in conflict with the Church, yet it never gained the status of a free city. From 1483 it came under the protection, then under the domination, of the Saxon dynasty. During the Thirty Years' War it became a Swedish stronghold, but in 1664 was recaptured by a Mainz archbishop. Ceded to Prussia in 1802, it was occupied in 1806 by Napoleon, who had met Tsar Alexander I there during the congress of 1800. Falling to Prussia in 1814, it was the scene in 1850 of the parliament of the short-lived N. German federation. During the Second Great War, the Germans made it a strong-point, and in its capture by the U.S. 3rd army it was largely destroyed. The Americans surrounded it April 11, 1945, but were counter-attacked four times. Next day, after a three-hour artillery bombardment and attacks by fighter bombers, the U.S. 80th div. launched an assault and cleared the city.

**Erg.** Unit of work; the work done when a body acted on by a force of one dyne moves one centimetre parallel to the line of action of the force. It is approximately the work done when a milligramme is raised through one centimetre. See Dyne.

**Ergometrine** or **ERGONOVINE**. One of the most important alkaloids of ergot. Isolated in 1935 by Dudley and Chassar Moir after the

latter had previously proved the existence in ergot of an unknown alkaloid, ergometrine ( $C_{19}H_{22}O_3N_3$ ) is readily soluble in water; this accounts for the activity of watery extracts of ergot. In medicine, a dose is  $\frac{1}{160}$  to  $\frac{1}{40}$  grain; by intramuscular injection,  $\frac{1}{160}$  to  $\frac{1}{40}$  grain; by intravenous injection,  $\frac{1}{160}$  to  $\frac{1}{40}$  grain. Its specific action is to initiate a long persistent rhythm of powerful contractions in a uterus normally quiescent. Clinically, ergometrine is remarkable for its rapidity of action; its greatest value is in the treatment of post-partum haemorrhage; in the control of excessive menstrual loss; and in the relief of migraine.

**Ergot** (Fr., spur). Fungoid pest (*Claviceps purpurea*) that attacks the flowers of cereals—especially rye—cultivated grasses, such as rye-grass and Timothy grass, and wild grasses. What should have been a grain is replaced by a hard spur-like outgrowth (ergot), which, if devoured by pregnant stock, may cause abortion. Ergots should not be sown with grain or grass seeds, and wild grasses infested by them should be destroyed.

The most important active principles of ergot are ergometrine (*v.s.*) and ergotoxine, which cause powerful contractions of the uterus. For this reason ergot or its preparations are sometimes administered after labour to ensure efficient contraction of the uterus and diminish the risk of post-partum haemorrhage. (Pituitary extract is more often used.) This property of ergot formerly led to its use to induce labour when desirable on medical grounds, but its action in this respect is uncertain.

Poisoning by ergot may be acute or chronic. Acute poisoning, which may result from taking a single large dose, gives rise to giddiness, vomiting, colic pains in the abdomen, disturbance of vision, cramps, muscular weakness, coma or delirium, and convulsions. Fatal cases are rare, but if the poisoning is associated with premature expulsion of the uterine contents the risk is much greater. Chronic poisoning is generally the result of eating, for a considerable period, bread which has been made from rye or other cereals infected with the fungus. Ergotism, as the condition is called, is not uncommon in Russia. The early symptoms are those of irritant poisoning: vomiting, diarrhoea, and pain in the abdomen. The latter symptoms present two types, the nervous and the gangrenous form. In the for-

mer there may be tingling sensations in the skin, spasms, and painful cramps in the muscles. Generalised convulsions resembling those of epilepsy may occur. Paralysis and affections of the mind, such as delirium, melancholia, or dementia, are other manifestations. The gangrenous form may lead to mortification of the fingers and toes. Both sets of symptoms may be present in one individual.

**Eric**, or **LITTLE BY LITTLE**. Story for boys by Dean F. W. Farrar, first published in 1858, the author being aged 27. This record of the conflicts and tribulations of Eric Williams at Roslyn School stresses with some force and passion the temptations of life and the retribution that may overtake any who succumb to them. The book ran through 36 editions during Farrar's lifetime. Though ill-attuned to later tastes in juvenile fiction, it remains a classic often quoted, if only in mockery.

**Eric XIV** (1533-77). King of Sweden, 1561-68. Born Dec. 13, 1533, he was the son and unworthy successor of Gustavus Vasa. His short reign was marked by the limiting of the power of the royal dukes and by the securing of Estonia, which began Sweden's policy of overseas expansion. His insanity and cruelty cut short his reign, for after the murder of the Stores in 1567 the nobles rose and deposed him (1568). At different times he contemplated marriage with Elizabeth of England, Mary of Scotland, Christina of Hesse, and Renée of Lorraine, but finally contented himself with marrying his mistress, Katrina Månsdotter, a peasant. He is believed to have been poisoned in Feb., 1577, at the order of his brother and successor, John.

**ERIC THE RED** (*f.l.c.* 985). Norse voyager. From Iceland he explored the W. coast of Greenland, 982-985, and founded a colony there the next year. He named the country Greenland to attract settlers and called his village Brattahlid. The father of Leif Ericsson (*q.v.*), he was the hero of Eric the Red's Saga.

**Ericaceae** (Gr. *erikē*, heath). Large family of evergreen shrubs, under-shrubs, and a few small trees. They are natives of temperate and cold climates. Have simple leaves, and regular flowers, some, *e.g.* the heaths (*Erica*), bell-shaped or tubular, others expanded, *e.g.* rhododendron.

**Ericht**. Loch on the borders of Perthshire and Inverness-shire, Scotland. Lying in desolate country 1,152 ft. above sea level, it is

14½ m. long and has a maximum depth of 513 ft. Overlooking the W. shore is Ben Alder (3,757 ft.). Here is a cavern in which Charles Edward sought refuge after the battle of Culloden. See Grampian Hydro-electric Scheme.

**Ericsson, JOHN** (1803-89). A Swedish-American engineer. Born July 31, 1803,

John Ericsson,  
engineer

in Vermland, Sweden, he developed great aptitude for mechanics, and in 1820 became an engineer in the Swedish army. Seeking a wider scope for his talents, he came to England and occupied himself with improvements in steam machinery. In 1829 he built, with John Braithwaite (*q.v.*), the motive engine to Stephenson's Rocket. Ericsson was occupied with various inventions, chiefly marine engines, up to 1836, when he brought out a marine screw propeller.

Not obtaining the recognition he expected from the British Admiralty, in 1839 he went to America, where he lived for the remainder of his life. Turning his attention to defensive armour for warships and improvements in marine engines, he gained a wide reputation. In 1861 he designed the famous armoured turret ship Monitor for the American navy. He died in New York, March 8, 1889.

**Ericsson, LEIF** (*fl.* c. 1000). Norse voyager who discovered N. America, 1000. Son of Eric the Red, he was ordered in 999 by Olaf Tryggvason, king of Norway, to proclaim Christianity in Greenland. Driven off his course, he sighted and landed on "Vinland," probably Nova Scotia.

**Eridanus.** One of the Ptolemaic constellations. The larger part is below the S. horizon to an observer in N. Europe. The constellation is also called the River.

**Eridge Castle.** Seat of the marquess of Abergavenny in Sussex, near the Kentish border, 3 m. S. of Tunbridge Wells. The estate has belonged to the Nevilles since the 13th century, but the present castle is 19th century. The park covers

2,000 acres. At Eridge Green are the denuded sandstone Eridge Rocks. The village has a railway station, and the place gives its name to the Eridge Hunt.

**Eridu.** Sumerian settlement at Abu Shahrain, S. of Muqayyar (Moghair or Ur), S. Babylonia. Originally an islet on a Persian Gulf estuary, sacred to the water-god Ea, it was the traditional cradleland of some aspects of Babylonian religion. Examined by J. E. Taylor, 1854, its sandstone wall, 20 ft. high, enclosed a platform with marble staircase, bearing a two-staged brick tower. Excavations by Thompson, 1918, and Hall, 1919, revealed a pre-Sumerian neolithic substratum and further excavations by the Iraq government, 1947, disclosed deeper lateral extensions of the platform, with a temple (4000 B.C.) beneath the tower, remains of still earlier temples, and much fine pottery. See Iraq illus.

Ericsson. The Monitor, an ironclad turret ship, built from Ericsson's plans by the Federal navy during the American Civil War

**Erie.** Southernmost of the chain of great lakes in N. America. It forms part of the boundary between the U.S.A. and Canada. Area, 10,000 sq. m. It is 250 m. long, and its greatest breadth is 60 m., while its average depth is 90 ft. The lake is 565 ft. above the

level of tide water in the Hudson river at Albany, and 330 ft. above the level of Lake Ontario, into which it discharges its waters by the Falls of Niagara. At its N.W. end it receives the surplus waters of lakes Superior, Michigan, and Huron, through the river Detroit. Contributory feeders are the rivers Thames and Grand. A large number of steamers and other ships traverse it, except in winter, when it is generally frozen for a considerable period. In very hard winters it is possible to cross from the U.S.A. to Canada over the ice.

Lake Erie is the outlet of a large system of connecting canals, which render its navigation of great importance. The Welland Canal connects with Lake Ontario; the Erie Canal affords communication between Buffalo and Albany, thus linking up with the Hudson river; the Ohio Canal begins at Cleveland and ends at Portsmouth, on the Ohio river; and the Miami and Erie Canal connects Toledo with Cincinnati. During the war of 1812-15 an American squadron, under Commodore Perry, captured here a British force of six vessels on Sept. 10, 1813.

**Erie.** City of Pennsylvania, U.S.A., the co. seat of Erie co. On Lake Erie, 88 m. S.W. of Buffalo. It is served by rlys. and an airport. The largest land-locked harbour on Lake Erie, with artificial improvements, it is protected by Presque Isle, a strip of land 6 m. long and 1 m. in extreme breadth, and has a maximum depth of 25 ft. An industrial and commercial centre with a valuable trade by lake and rly. in coal, iron, grain, and agricultural produce, Erie is said to ship more fresh-water fish than any other

Erie. Port Colborne, Ontario, on Lake Erie. The lake, which forms part of the boundary between Canada and the U.S.A., is connected by the Welland Canal with Lake Ontario. It is an important shipping waterway

port in the world. It leads in U.S. production of engines and boilers and also makes locomotives, stoves, pumps, furniture, wood-work, leather, and paper. The federal building and city hall are prominent. Founded on the site of the old French fort of Presque Isle, erected 1753, Erie has a city charter dating from 1851. In 1915 the city was inundated by a cloud-burst. Pop. 116,955.

**Erie Canal.** The largest artificial waterway in the U.S.A. Extending across New York state from Buffalo to Troy, it communicates between the Hudson river and Lake Erie. Begun in 1816 as a pioneer U.S. engineering feat, and completed in 1825, it was originally 363 m. long from Buffalo to Albany. The canal, which made possible the all-water transport of Pennsylvania's coal, iron, and petroleum and the Middle West's agricultural produce to the Atlantic, was responsible for the rise to commercial supremacy of the state and port of New York. Today petroleum products constitute the bulk of goods transported. The canal gives passage to vessels of 2,000-3,000 tons. It is 340 m. long, 150 ft. wide, 12 ft. deep, and has 34 locks. For five months in the year ice obstructs navigation.

**Erigena.** JOHANNES SCOTUS (c. 810-877). Scottish philosopher and theologian. He was a Scot born in Ireland, at the time called Greater Scotland, and his name Erigena means Irish-born. Summoned by Charles the Bald to Paris, he became teacher at the court school. Erigena attempted to combine the neo-Platonist theory of emanation with the Christian idea of the Creation and the doctrine of the Trinity, the result being a kind of pantheism, the view that all things are contained in God. De Divisione Naturae was his chief work.

**Erin.** Poetical name for Ireland. It was popularised by Thomas Moore's Irish Melodies, but is of much earlier origin. Philologists assume an old Celtic form, Iveriu or piveriu, probably meaning fertile (cf. Gr. *πῖον*, fat), in old Irish Eriū, in the declension of which Erin, Erinn, appear. The Greek name Iernē = Ivernē, the v being

preserved in the Latin Juvēna or Jubernā, of which Hibernia (q.v.) is another form.

**Erin go bragh.** Irish phrase meaning Ireland for Ever. Through its association with Ireland's demand for a freer and more independent government it became a party instead of an entirely national cry. It is widely used as an expression of national sentiment.

**Erinus.** Genus of alpine herbs of the family Scrophulariaceae, natives of W. Europe. The spoon-shaped leaves, which grow in a tuft, have their broad ends boldly cut into about five pointed teeth. The leafy stem ends in a cluster of rosy-purple or white flowers.

Erinus. Roots, foliage, and flower of *Erinus alpinus*

**Erinyes.** In Greek mythology, older name of the Eumenides (q.v.), or tragic furies.

**Eriocaulaceae** (Gr. *erion*, wool; *kaulos*, stalk). Family of rush-like perennial marsh herbs. Chiefly natives of the tropics. They have slender, spongy leaves, and minute flowers gathered into a head. These flowers are either male or female, the former having two or three stamens and a rudimentary ovary, the latter with developed ovary and short style, but no stamens. Pipe-wort (*Eriocaulon septangulare*), a N. American species, occurs in muddy lakes of W. Ireland.

Eriocaulaceae. 1. Leaf of a species of *Eriocaulon*. 2. Male flower. 3. Entire plant. 4. Head of flower

**Eriphylē.** In Greek legend, sister of Adrastus, king of Argos, and wife of Amphiarus. Before he joined the expedition of the Seven against Thebes, Amphiarus charged his son Alcmaeon to murder his mother as soon as he should hear of his father's death,

and in due course Alcmaeon obeyed his behest.

**Eris.** In Greek mythology, goddess of discord. Annoyed at not being invited with the other gods to the wedding-feast of Peleus and Thetis, she threw a golden apple into the midst of the feast inscribed "For the fairest." It was claimed by Hera, Athena, and Aphrodite, and the Trojan prince Paris had to judge. Because he chose Aphrodite, she rewarded him with possession of Helen of Greece, which led to the Trojan war.

**Eriskay.** Island in the Hebrides, Scotland, lying S. of South Uist. It is the spot at which Prince Charles Edward landed with seven companions from France, July 23, 1745; according to legend he planted a white convolvulus which will grow nowhere else. The Eriskay Love Lilt is one of the most familiar Hebridean songs.

**Erith.** Industrial town and borough of Kent, England. It is on the S. bank of the Thames, 14 m. E. of London, and is served by the electrified railway and London Transport. The town is divided into industrial and residential districts: the latter, to the S., consist of Abbey Wood, Belvedere, and Northumberland Heath. The industrial section, with a frontage of 4 m. on the river, does not intrude upon the amenities of the town.

Erith arms

Engineering works, cable and plastic manufacture, edible oil refining, chemical works, coal shipping, lighterage, building materials, stoneware, and asbestos works provide employment. The church of S. John the Baptist has some interesting brasses: parts of it date from the 12th and 13th centuries. The Royal Alfred Seamen's Home for disabled seamen is in the town. In the Middle Ages Erith was famed for its ship-building, and the first man-of-war was built here. A borough charter was granted in 1938. It suffered damage from the Luftwaffe during the Second Great War. Pop. est. 42,000.

**Eritrea.** Political division of East Africa. It is a coastal strip of coral formation on the Red Sea, running about 670 m. between the Anglo-Egyptian Sudan and French Somaliland, and bounded to S.W. by Abyssinia. The coast, with a tropical climate,

is often excessively hot and moist, but the uplands are cool; rain is adequate for agriculture and is supplemented by irrigation, while pasture abounds. Products include hides, butter, palm nuts, ostrich feathers, salt, gold. Pearl fishing is carried on at Massawa and in the Dahlak Archipelago. The principal towns have been connected by rly. and motor highway. Asmara is the capital and Massawa its port. The natives speak Tigre or Tigrine and include Christians and Muslims. Area 15,754 sq. m. Pop. est. 850,000, partly nomadic.

Massawa was occupied by Italy in 1885, and the surrounding territory was formed into the

definitely ceded to Russia by the treaty of Turkmanshai, 1828. It became chief town of a government in Transcaucasia, and in 1918 centre of an Armenian republic. Here are an Armenian university and national museum. Pop. 200,000.

**Erlangen.** Town of Bavaria, Germany. It is in Franconia, 15 m. N.N.W. of Nuremberg, just where the Schwabach joins the Regnitz. Its chief buildings are the town hall and the university (1743, a former palace), and there are a number of churches, schools, etc., but none is notable architecturally. Industries concern electric instruments, beer, paper, and textile goods, the last, to which the

1906. A ballet, *Les Cent Baisers*, was one of the most successful productions of the de Basil company's seasons at Covent Garden, 1935-36. A symphonic suite and a violin concerto gained reputation.

**Erlanger, JOSEPH** (b. 1874). American physiologist. He was born Jan. 5, 1874, at San Francisco, and studied at the universities of California and Johns Hopkins. At Johns Hopkins hospital, 1899-1900, he became instructor, assistant, and associate professor at the university, 1900-1906. He was professor at Wisconsin university 1906-10, and at Washington university, St. Louis, 1910-46. A member of the National Research Council, 1922-26, and of many learned societies, he was awarded the Nobel prize for physiology and medicine in 1944. Erlanger wrote (with H. S. Gasser) *Electrical Signs of Nervous Activity*, 1937; *Symposium on the Synapse*, 1939.

**Erlau.** Variant name of the city in Hungary better known as Eger. The red wine produced in the area is called Erlauer. See Eger.

**Erl-king** or **ERLKING**. Figure in German mythology. He personifies an evil spirit haunting forests and plotting mischief to passers-by, especially children. The word, meaning king of the alders (Ger. *Erle*), from the vapours that cling to these trees at night, is a mistranslation, and should properly be elf-king, its meaning in Scandinavian (Dan. *Ellerkonge*). The character was introduced to German folklore by Herder's translation of the Danish ballad, *Sir Olaf and the Erl-king's Daughter*, 1778-79. It is the subject of a famous ballad by Goethe, set to music by Schubert.

**Ermeland.** A level, sandy region, stretching inland from the Frisches Haff between Elbing and Königsberg (Kaliningrad). It covers about 1,700 sq. m. The name was borne by a district in Prussia before that country passed into the possession of the Teutonic Order. It was later the principality of a bishop, who was a member of the medieval empire. In 1466 it was added to Poland, but at the partition of the latter in 1772 it was seized by Prussia. It includes Olsztyn (Allenstein), capital of the new Polish district of Masuria. The dividing line between the part of E. Prussia incorporated in Lithuania and the part incorporated in Poland by the Polish-U.S.S.R. treaty of Aug., 1945, runs through the district. Pop. (pre-war) 270,000, mostly R.C. and largely Polish.

Erith, Kent. A view of the High Street of this borough on the south bank of the Thames. See text in facing page.

colony of Eritrea in 1889. Italian enterprise was checked after a disastrous defeat by Abyssinian forces at Adowa, March 1, 1896. By an Act of 1936 the territory became a state of Italian East Africa. For the Second Great War in Eritrea, see East Africa Campaign. At the conclusion of the fighting, the country came under a British military administration which carried out improvements in agriculture and forestry, education and justice. In 1942 Eritrea was developed as a U.S. base. *Consult* Short History of Eritrea, S. H. Longrigg, 1945.

**Erivan.** Capital of Armenia S.S.R. It stands on the Sanga, near the Turkish border, 40 m. N.E. of Ararat and 145 m. S. of Tbilisi. It is the seat of a bishopric and contains the remains of an old palace of the Persian viceroys. An active trade is carried on in leather, pottery, and cotton. After being alternately in the hands of Turks and Persians, Erivan was taken by the Russians in 1827, and

town owes much of its prosperity, having been introduced by immigrant Huguenots. The university was founded by Frederick, margrave of Baireuth; it has a large library, botanical garden, and hospital, in addition to laboratories, etc. Erlangen passed in the Middle Ages from one ruler to another. It was made a town in 1398, and until 1791 was in the margraviate of Baireuth; then it passed to Prussia and in 1810 to Bavaria. Pop. 32,348.

**Erlanger, FRÉDÉRIC, BARON D'** (1868-1943). A Franco-British composer. He was born in Paris, May 29, 1868, and studied music under Ehmann. In 1891 he became a naturalised British subject, joining his brother Émile in a firm of financiers. He died April 23, 1943. As a composer he was influenced by Bizet and Chabrier, and his compositions included operas, orchestral pieces, songs, and chamber music. The best-known operas were *Inez Mendo*, 1897, and *Tess of the d'Urbervilles*,

**Ermine.** Name given to the winter phase of the stoat, when the fur is white with the exception of the black tip of the tail. In Great Britain this change from the brown of summer takes place regularly in Scotland, and often in the N. of England; but further S. it is very rare. The ermine fur of commerce comes from more northern latitudes, chiefly from Alaska; but it is now in little favour, except for official robes. The name is a corruption of *Lat. Armenius (mus)*, i.e. Armenian (mouse), or of *Ger. Hermelin*, ermine, ermine-fur. (*See Stoat.*)

**Ermine in heraldry** is the principal fur. It is represented as silver or white powdered with sable spots, usually depicted like a small arrow head surmounted by three dots. There are four variants: ermines represented as black powdered with silver spots; erminettes or erminites, represented as black with silver spots between two red hairs; erminois, black with gold spots; and pean, gold with black spots.

**Ermine Street.** Early English name for an ancient British highway from London to Lincoln, and thence to York. Incorporated in part into the Romano-British road system, it passes through London via Kingsland and Stoke Newington to Royston, thence through Godmanchester, Castor, Ancaster to Lincoln. It appears in the laws of Edward the Confessor as one of four royal roads.

**Ernakulum.** Town of India, in Travancore and Cochin, formerly cap. of Cochin; the terminus of a rly. which connects the state with the main line of the Madras rly. The Raja's College here accommodates 700 students. Pop. 41,200.

**Erne** OR SEA EAGLE (*A.S. earn*, eagle). The white tailed sea eagle (*Haliaeetus albicilla*), the only member of its group still found in Great Britain. It is of brownish colour, has a white tail, and is about 3 ft. in length. It still breeds in the Hebrides, but is becoming rare.

**Erne.** River of Eire and N. Ireland. It issues from Lough Gownagh, in co. Longford, and flows mainly N. through Lough Oughter and both upper and lower Lough Erne until it falls into Donegal Bay near Ballyshannon. Its length is 70 m. Enniskillen is the chief town on its banks, and after leaving Longford it passes

through counties Cavan and Fermanagh. The hydro-electric scheme utilising the falls of the lower Erne in and above Ballyshannon (*q.v.*) supplements the Shannon scheme. Erne salmon fishing, except in the estuary, must suffer.

**Erne.** Name of two loughs or lakes of co. Fermanagh, N. Ireland. The upper lake is 13 m. long, and in one place 4 m. wide; the lower lake is 18 m. long, and from 2 to 5 m. broad. The river Erne passes through them, the distance between the two being 10 m. The lakes occupy hollows in the limestone, and have a very irregular shape; the upper portion is merely a collection of narrow ponds abutting on the river. In both, but especially in the upper lake, are numerous islands.

**Ernest.** Masculine Christian name, probably derived from the German *ernst*, serious. The French form is Ernest; Ital. and Span. Ernesto. Its introduction into Britain dates from the 18th century: the fifth son of George III was Ernest Augustus (*v.i.*). The feminine form is Ernestine.

**Ernest Augustus** (1771-1851). King of Hanover. The fifth son of George III of England, he was born at Kew, June 5, 1771. He entered the Hanoverian army and distinguished himself during the Napoleonic wars. In 1799 he was made duke of Cumberland and Teviotdale, and in the house of lords he acted with the more extreme Tories in opposing all kinds of reform especially Roman Catholic emancipation and the reform measure of 1832. In 1810 some excitement was caused by a murderous attack made on the duke by his valet; the latter was afterwards found dead, and some went so far as to accuse Ernest of his murder.

Until the birth of a daughter, Victoria, to his elder brother Edward, he was heir presumptive to the English throne. By the operation of the Salic law he (and not Victoria) succeeded to the throne of Hanover in 1837. There he reigned for fourteen years. He would not hear of anything in the nature of constitutional reform, but in spite of troubles caused by this unyielding attitude he was popular with his subjects. He died Nov. 18, 1851, and was succeeded by his son George. His wife was Frederica, daughter of Charles, duke of Mecklenburg-Strelitz.

**Ernie, ROWLAND EDMUND PROTHERO, BARON** (1852-1937). British politician and writer. Born Sept. 6, 1852, at Clifton-on-Teme, he was educated at Marlborough

and Balliol College, Oxford, becoming fellow of All Souls. He was admitted to the bar, and in 1894 was editor of *The Quarterly Review*. An authority on agriculture, he was appointed agent-in-chief to the duke of Bedford in 1899. In 1914 Oxford University chose Prothero as one of its members, and in 1916 he was included in the Coalition government as president of the board of Agriculture. He continued in office after the general election of 1918, and was made a peer. He wrote *The Pioneers and Progress of English Farming*, 1888; *English Farming, Past and Present*, 1912; but his most popular works are *Life and Correspondence of Dean Stanley*, 1893 (with G. G. Bradley); *The Psalms in Human Life*, 1903; *The Land and Its People*, 1925. He died July 1, 1937.

**Ernst, MAX** (b. 1891). German painter. Prominent among the early surrealists, he was one of the leaders of the movement. He worked in Paris during the 1920s, and was among the first of the group, which included Dali (*q.v.*), Tanguy, and Masson, to abandon abstract form for recognizable imagery. His work was banned by the Nazis in Germany. His book illustrations, executed for the *Éditions du Carrefour* in 1930, were among his popular works.

**Ernulf** OR ARNULF (1040-1124). English ecclesiastic. He was born in France and educated at Bec, under Lanfranc. Made prior of Canterbury by Anselm, he was abbot of Peterborough from 1107 to 1114, when he became bishop of Rochester. He was a great authority on canon law, and the author of the *Textus Roffensis*, preserved in the library of Rochester Cathedral, which comprises records of the cathedral, and other historical ecclesiastical, and legal documents. This collection contains the form of excommunication entitled *The Pope's Dreadful Curse*, quoted by Sterne in *Tristram Shandy* to show his veneration for the pious bishop who had ready for use "fit forms of swearing suitable to all cases."

**Erode.** Town of Madras, India. It is in the Coimbatore district, and was at one time a place of some importance. It suffered during successive invasions of the country in the 17th and 18th centuries. The town, which is the headquarters of the divisional officer, contains two old temples. Pop. 35,000, five-sixths Hindus.

**Eroica.** Popular name of the symphony No. 3 in E flat by Beethoven (op. 55). Completed in

Aug., 1804, it was intended originally as a tribute to Napoleon, but Beethoven's later revulsion against the conqueror caused him to modify the sub-title to "In memory of a great man," and Prince Lobkowitz received the dedication. The magnificent sweep of the first movement, and the profound, sombre slow movement have caused this work to be acclaimed among Beethoven's greatest.

**Eros** (Gr., love). In mythology, the Greek name for Cupid (*q.v.*). It is also the popular name for the aluminium figure surmounting the Shaftesbury memorial fountain designed by Alfred Gilbert (*q.v.*). Erected in Piccadilly Circus, London, this winged statue, 9 ft. in height, was unveiled in 1893. During the reconstruction of the tube rly. station under Piccadilly Circus, 1925-28, it was placed in the Embankment Gardens, and it was again removed from its site during the Second Great War, being replaced June, 1947. The sculptor intended the figure to symbolise the Christian virtue of charity.

**Eros**. One of the nearer minor planets, discovered in 1898. The importance of the asteroid is that it can approach within 14,000,000 m. of the earth. At such times observations of its distance can be made accurately, and thence, its orbit being known, the mean distance of the sun from the earth can be found, this quantity being the fundamental unit of distance used by astronomers (*see* Astronomical Unit). In 1930-31 Eros came within 16,200,000 m. and international cooperation made available nearly 3,000 photographs taken with 30 telescopes in 14 different countries. Sir Harold Spencer Jones in 1941 arrived at the value 93,003,000 m. for the sun's distance.

**Erosion** (Lat. *erosio*, eating away). The wearing down of the earth's surface through the action of the atmosphere, rain, rivers, ice, and the sea and its tides. Atmospheric erosion is either chemical or mechanical. Wind transports particles and polishes surfaces over which they are carried, *e.g.* in deserts. Sudden changes of temperature cause particles of rock to split off, subsequently to be removed by wind or water. Atmosphere acts chemically through rainfall, in causing decomposition of rocks. Disintegration of rocks being thus effected, the products are afterwards removed by running water, the water usually eroding the boundaries of its course by abrasive action of materials carried.

Erosion beneath the surface of the ground is chiefly chemical, and often results in formation of caves and caverns, especially in limestone districts. Glacial erosion takes place over large areas and on an extensive scale, ice being, under certain conditions, a powerful scouring agent. Marine erosion is in continuous progress along coasts, the sea often using debris broken from cliffs by waves as battering-rams for further destruction. The burrowing of animals, *e.g.* worms, and penetration of roots of plants assist also in disintegration of land surfaces. The tendency of all erosion is to level the land. *See* Coast; Glacier; Soil Erosion.

**Erosion**. Term used in metallurgy. Metal articles can be fabricated by first grinding the metal to a powder, pressing into shape in suitable moulds, and then baking. The pulverisation is sometimes referred to as erosion. The term is also used to describe effects which lead to corrosion of metals normally protected by surface films. These effects are due to the breakdown of cavities beneath the protective layer, leaving the metal exposed to corrosive agents.

**Erotic Literature** (Gr. *erōtikos*, amatory). Literature inspired by the theme of love. The name is generally applied to poetry, and latterly more especially to poetry of a warmly impassioned character. The classical erotic poets include Anacreon, Callimachus, Sappho, and Theocritus among the Greeks; Catullus, Horace, Ovid, and Tibullus among the Latins. The troubadours of the Middle Ages carried on the erotic tradition in France, and at the Renaissance this form of literature had a revival on the continent of Europe. In English literature it reached a high level in the lyrical work of poets of the 17th century, such as Donne, Cowley, Herrick, Waller, Lovelace, and Suckling. In the 19th century, more especially in the latter half, it had a recrudescence in the poems of Rossetti and Swinburne, and in France in the writings of Baudelaire and others.

**Er Ram**. Village of Palestine. It is situated on a hill on the Jerusalem-Nablus road. Identified as the ancient Ramah (*q.v.*) of Benjamin (1 Kings 15), it formed a kind of frontier castle between the N. and S. kingdoms of Palestine, and was repeopled after the return from captivity. It was taken by Allenby, Dec. 28, 1917, in the British advance after the capture of Jerusalem in the First Great War.

**Erratics** (Lat. *errare*, to wander). In geology, portions of rock of varying size which have been moved from their original home by natural agencies. They commonly consist of rock-fragments torn away by glaciers, and often bear scratches resulting from movement under great pressure. They occur in great profusion in glacial boulder-clays, and are often spread over high levels by glacial torrents. *See* Glacier; Rock.

**Errigal** OR ARIGAL. Mountain of Donegal, Eire, the highest point in Ulster. It is 5 m. S.E. of Gweedore and is 2,466 ft. high.

**Erroll**, EARL OF. Scottish title borne since 1452 by the family of Hay. William Hay, hereditary constable of Scotland, an honour given in 1315 to his forefather, Sir Gilbert, was made an earl in 1452. Francis, 9th earl, was active in the 16th century, being constantly in rebellion against James VI. He was then a Roman Catholic, and in league with Spain; in 1594 he led a small rising, after which his residence, Slains Castle, was destroyed. Later he became a Protestant.

A dispute as to whether Erroll or the earl marischal was the rightful constable was decided in favour of the former, and so the earls take precedence in Scotland just after the royal family. When the 13th earl died unmarried his sister succeeded to the title. The great-nephew who followed was a son of the earl of Kilmarnock who was executed for his share in the rising of 1745, but this did not affect his succession to the earldom of Erroll, and from him the later earls are descended. The 18th earl was made a peer of the U.K. as Baron Kilmarnock in 1831. Diana Denyse Hay (b. Jan. 5, 1926), since 1941 countess in her own right and 23rd holder of the title, married Capt. Iain Moncreiffe in 1946.

**Erromanga**. One of the S. group of the New Hebrides. It measures 30 m. long by 20 wide. The chief anchorage is Dillon's Bay; the chief product, copra. Here John Williams, the missionary, was killed and eaten by cannibals in 1839.

**Error**. False idea which is regarded as true; or the degree or extent to which a statement deviates from the actual. An example of the former is the belief, held for many centuries, that the sun revolves round the earth. An example of the latter is the statement that the population of England and Wales in 1931 was 40,000,000 to the nearest million,

the error in this figure being not more than plus or minus half a million. The word is used in the second sense particularly by scientists, statisticians, engineers, etc.

An error of the other type, commonly called a fallacy, is caused by an appearance of truth which is deceptive. Such an error may arise through faulty definition, misunderstanding, or wrong use of words, ambiguous statements, bad deduction, faulty observation, incorrect generalisation, confusion of cause and effect. Human history abounds in notable fallacies. Many of them are systematically dealt with in such books as Jevons's *Elementary Lessons in Logic*, Mill's *Logic*, Welton's *Manual of Logic and Groundwork of Logic*.

The advance of natural science has corrected many faulty observations and vastly improved our power to observe, and thus has tended to lessen the number of material errors; but little progress has been made towards the elimination of formal errors, *i.e.* those violating the rules of good reasoning. Terms are still used without adequate definition; we still "argue from the particular to the general," and "beg the question," mistake cause and effect, and presume where we cannot prove. We are prone to the fallacy of epithets: we believe we have proved our judgement of a person or act or thing when we have chosen a particularly strong adjective to describe it.

**ERROR IN APPROXIMATION.** In a statement such as 65,000 tons to the nearest thousand, or 0.036 inch to the nearest thousandth, the degree of approximation is stated. In the former we are told that the actual weight lies between 65,000—500 tons and 65,000+500 tons (the statement might be written 65,000±500 tons); in other words, the true weight lies between 64,500 and 65,500 tons. In the second statement we are told that the true length is 0.036±0.005 inch, *i.e.* it lies between 0.0355 and 0.0365 inch. The amount of error that is allowable in a statement depends on the circumstances. Thus, if we are considering the profit of a company which last year made £1,465,594 16s. 11d., it would probably suffice if we knew that the profit was £1.5 million to the nearest half-million pounds; if, on the other hand, we were considering the cost of generating electricity, say 0.1374d. a unit, we might be interested in the nearest ten-thousandth of a penny. The cook might weigh to the nearest

ounce; the research chemist to the hundred-thousandth part of a gramme.

The amount by which the statement of a quantity differs from the true quantity is called the *absolute error*. Thus, the absolute error in the statement of the company's profit as £1.5 millions was £34,405 3s. 1d. Generally the absolute error of an approximation is not more than half the unit of approximation.

**Error, WRIT OF.** Name of a writ of appeal to the king's bench in criminal cases, or to the court of exchequer chamber or the house of lords in civil cases. It was for errors appearing on the record, but it is now abolished in all cases.

**Ersatz** (Ger., equivalent, substitution). Term used in Germany to denote artificial substitutes for natural materials. The word came into use in the First Great War, when it was originally applied to coffee made from acorns and to sugar extracted from wood. During the Second Great War, the greater part of German commodities of everyday consumption, *e.g.* food, clothing, utensils, etc., were of ersatz materials or had an ersatz basis. Ersatz or substitute materials have been developed all over the industrial world and may be said to include plastics, buna, and rayon. See *Synthetic Chemistry*.

**Ersch, JOHANN SAMUEL** (1766–1828). German bibliographer. He was born at Grossglogau, Silesia, June 23, 1766, and studied at Halle. He was successively librarian, 1800, and professor, 1803, at Jena, and principal librarian, 1808, at Halle. His *Handbuch der deutschen Literatur seit der Mitte des 18ten Jahrhunderts, 1812–14*, laid the foundation of modern German bibliography. In 1818 he began, with J. G. Gruber, the famous *Allgemeine Encyclopädie der Wissenschaften und Künste*, which was not completed a century later. He died at Halle, Jan. 16, 1828.

**Erse.** Early Scottish variant of Irish. In the 14th–15th centuries the term was used of kings and caterans. In the 18th century it denoted Gaelic speech; at first Scottish Gaelic, and subsequently Irish Gaelic. It is no longer in current usage in this sense. In philology it sometimes designates the language-group embracing Gaelic and Manx, which is now usually called Goidelic, being brought to Britain by the Goidels, the precursors of the Brythons (*q.v.*). See *Gaelic Language and Literature*, Goidels; Ireland: Language and Literature.

**Erskine, THOMAS ERSKINE, 1ST BARON** (1750–1823). British lawyer. A younger son of the 10th

1st Baron Erskine,  
British lawyer  
After Hoppner

earl of Buchan. He was born in Edinburgh, Jan. 10, 1750. After a scanty education at Edinburgh and St. Andrews, he abandoned careers in both navy and army, and in 1778 was called

to the bar. Erskine's success was instantaneous. He made his name in his first case, and in 1781 added to his reputation when junior counsel for Lord George Gordon. In 1783 he was elected M.P. for Portsmouth, and after six years' absence he was again returned for that borough in 1790. He defended Paine, Tooke, and others who wrote in favour of the French Revolution. Having been attorney general and chancellor to the prince of Wales, he was lord chancellor in the Whig ministry of 1806–07. He was then raised to the peerage, and died Nov. 17, 1823. *Consult* Speeches, ed. J. Ridgway, with Memoir by Lord Brougham, 4 vols., 1847; *Lives of the Chancellors*, Lord Campbell, 4th ed. 1856–57.

Erskine's eldest brother, Henry (1746–1817), was also a distinguished advocate. Trained at St. Andrews and Edinburgh for the Scottish bar, he was lord advocate in 1783, and again in 1806–07. He died Oct. 8, 1817. Like his brother's, his reputation rests upon his stately and pleasing eloquence.

**Erskine, EBENEZER** (1680–1754). Scottish divine and founder of the Secession Church. Born at Dryburgh,

Ebenezer Erskine,  
Scottish divine

Berwickshire, June 22, 1680. He was educated at Edinburgh University. His first charge was at Portmोक Kinross-shire, whence he moved to a church at Stirling. There he came into collision with his ecclesiastical superiors, and the matter came to a head when, in 1732, he declared that parishes should choose their own ministers. This led to his suspension, but with some associates he founded a separate presbytery, which developed into the Secession Church.

In this Erskine remained until 1748, when the section opposed to him secured his removal from the ministry. He died at Stirling, June 2, 1754. His *Life and Diary* appeared in 1840. See Presbyterianism; Secession Church.

**Erskine, JOHN**, of DUN (1509-91). Scottish reformer. He was educated at King's College, Aberdeen, travelled on the Continent, and in 1534 returned with a French scholar, who introduced the study of Greek into Scotland. His enthusiasm was equally divided between the new learning and the new faith. He was an intimate friend of John Knox, and his influence was always exerted in the direction of moderation. He was moderator of the general assembly and in 1579 was appointed a member of the king's council.

**Eruptive Rocks.** Rocks which have been either extruded at the surface of the earth or have consolidated beneath the surface under pressure of overlying rock-masses. Those extruded (effusive rocks), as in volcanic eruptions, are of the type of lava and are found near volcanoes, active or extinct; they frequently exhibit flow-structure, indicating rapid consolidation. Basalts and rhyolites are examples.

Rocks consolidated beneath the surface (intrusive rocks) are of two kinds: very deep-seated (plutonic) and less deep-seated (hypabyssal). Plutonic rocks are usually coarsely crystalline, never glassy or with vapour cavities; hypabyssal rocks are often coarsely crystalline, but show great variation in structure. Intrusive rocks occur as areas of great extent and irregular shape (batholiths), as spreading sheets forced up from below between other strata (laccoliths and sills), as filling the pipes of old volcanoes (necks), as occupying more or less vertical fissures (dykes), or as branching injections (veins). See *Geology*; *Rock*.

**Ervine, ST. JOHN GREER** (b. 1883). Northern Irish dramatist and dramatic critic. Born at Belfast, Dec. 28, 1883, he became interested in the theatre at an early age. His first play, *Mixed Marriage*, was produced in 1911 at The Abbey Theatre, Dublin (of which he was manager in 1915). Of forceful disposition, he was a rugged individualist, and his most successful plays included *Jane Clegg*, 1913; *The Ship*, 1922; *The First Mrs. Fraser* (adapted from his novel of the same name), 1929; *Anthony and Anna*, 1935; *Robert's Wife*, 1937. He wrote novels, studies of Carson and Parnell,

lives of General Booth and Viscount Craigavon, and books on theatre craft, e.g. *The Organized Theatre*, *The Theatre in My Time*. An able controversialist on many subjects, he was for many years dramatic critic to the *Morning Post* and the *Observer*.

**Erymanthus** (mod. Olonos). Mountain of Arcadia, ancient Greece. The loftiest peak in the Kalliphonia range, it is associated with the story of Hercules and the Erymanthian boar which haunted this region and was slain by the hero. Alt. 7,296 ft.

**Erysipelas** (Gr. *erythros*, red; *pella*, skin). Acute contagious disease due to infection by the micro-organism *Streptococcus pyogenes*. Infection occurs through some injury to the surface of the skin, which may be quite trivial, such as a cut while shaving. It was formerly believed that the disease could arise without a wound, the so-called "idiopathic" form, but it is now recognized that in every case there is some lesion, however small. The skin rapidly becomes swollen and red, the inflammation advancing with a more or less well-defined margin and dying away behind this. The face is most frequently involved, and the swelling may cause the eyes to close. The temperature rises to 103° F. or more, and delirium may occur.

The duration of the disease is variable, but generally it lasts from one to three weeks. Death in healthy adults is rare, but in aged, debilitated persons and chronic alcoholics the outlook is not so good. Recently delivered women exhibit an increased liability to the disease. Treatment is by the sulphamide and streptomycin group of drugs and by the use of antistreptococcal serum. Ichthyol has been found to be a useful local application, and belladonna or opium may be used to relieve pain. The patient must be isolated.

**Erythema** (Gr. from *erythraînein*, to make red). Redness of the skin owing to dilation of the small blood-vessels. The condition may be localised, when it may be due to simple inflammation, burning, or irritation by chemical substances, or it may be more or less present over the whole body, when it is usually a symptom of infectious fever, e.g. scarlet fever or measles; or of poisoning by unsound food or certain drugs, particularly belladonna, or is a manifestation of disease of the skin.

**Erythrite** (Gr. *erythros*, red). Sweet-tasting carbohydrate alcohol known under various synonyms

e.g. erythritol, erythrol, erythroglucin, erythromannite, lichen sugar, phycite, tetrahydroxybutane. First prepared by Stenhouse in 1848 from several species of lichen such as orchella weed (*Roccella tinctoria*), it occurs in the free state or combined with orsellinic acid, or may be made synthetically. It crystallises in large transparent prisms, with a melting point of 126° C.

**Erythrite** or **COBALT BLOOM**. A cobalt mineral, hydrous cobalt arsenate,  $\text{Co}_3\text{As}_2\text{O}_8 \cdot 8\text{H}_2\text{O}$ , peach-red in colour and occurring in monoclinic prismatic crystals, often in globular or earthy incrustations. It is of secondary origin, formed from primary cobalt minerals in the upper and oxidised portions of deposits. See *Cobalt*.

**Eryx** (mod. Monte San Giuliano). Mountain of Sicily near Drepanum (Trapani). It was crowned by a famous temple of Aphrodite, who was locally called Erycina. The temple derived its revenue from 17 Sicilian towns belonging to it. On the W. slope of the mountain is the decayed town of Eryx. Its old Roman walls still exist beside the ruins of the temple. The mountain is 2,465 ft. high.

**Erzberger, MATTHIAS** (1875-1921). German politician. Born at Buttenhausen, Sept. 20, 1875, and educated at Freiburg, he devoted himself to the study of political economy. Interested in the Christian Socialist movement, in 1897 he was a delegate at the international conference at Zürich. He entered the Reichstag in 1903, and came into prominence in 1917 when, as a member of the Catholic or Centre party, he made a speech accusing ministers of misrepresenting the military situation, and demanding the reform of the Prussian franchise and a statement of the peace aims of Germany. In 1918 Erzberger was secretary of state when Prince Max of Baden was imperial chancellor, and in 1919 was minister of finance and vice-premier, an honest and far-seeing politician. He resigned in Feb., 1920, and was assassinated on Aug. 26 of the following year.

**Erzerum** or **ERZURUM**. Town of Asiatic Turkey and capital of a vilayet of the same name. It lies in a wide plain at an alt. of 6,250 ft. above sea level, 120 m. S.E. of its port Trabzon, 150 m. W. of Mt. Ararat, and is an important commercial town and military position. It is walled and its streets are narrow and crooked. It has few fine buildings, the chief being the Armenian and Greek churches.

Erzerum. The mountain city of Armenia, once a frontier fortress of the Ottoman Empire. To the right is the medieval citadel

Erzerum is the seat of an Armenian bishop. Leather goods provide the industries. Pop. 52,534; vilayet, 371,394.

Its main importance came from its position strategically with respect to Russia. Under the Turks, who occupied it in the 16th century, it was made into a fortress and was the headquarters of an army corps. It was taken by the Russians in 1829 and again in 1878. During the First Great War it was brilliantly captured by the Russians in Feb., 1916, but during the winter of 1917-18 it was abandoned by the Bolshevik government, and was reoccupied by the Turks in March, 1918, in spite of strong resistance by the local Armenians. Erzerum was the scene of massacres of Armenians in 1895 and again in 1915.

**Erzgebirge or Ore Mountains.** Mountain range of Central Europe, partly in Saxony and partly in Bohemia, stretching for about 90 m. from the Elbe to the Elstergebirge. The highest peaks are in the centre, the Keilberg being over 4,000 ft. high. Only a little lower are the Fichtelberg and the Spitz-

resorts in the mountains which are visited both for health and pleasure, much of the scenery being very fine. The hills are densely wooded and the district is well served by railways.

**Erzingan or ERZINJAN.** Town of Asiatic Turkey, the medieval Arsingia. This formerly important military centre of the Turks lies on the W. Euphrates (Kara Su) about 75 m. W. of Erzerum, and is the principal town of a vilayet. During the First Great War it was the headquarters of a Turkish army corps, and as a military base was second in importance only to Erzerum. It was taken by the Russians in July, 1916. Many of its Armenian inhabitants were massacred in 1915. Silk and cotton are manufactured. The town lies at an alt. of 3,900 ft. above sea level. Pop. of vilayet, 158,498.

**Esarhaddon.** Assyrian king, who reigned 680-668 B.C.

**Esau.** Son of Isaac and elder brother of Jacob, whose great rival he became after the younger brother had secured by a trick the privileges of primogeniture (Gen. 25 and 27). Esau became a hunting man, married wives of Hittite nationality, and founded a tribe which occupied the mountains S. of the Dead Sea. In his later days he was on friendly terms with Jacob, but his descendants were always hated and despised by the Jews. See Jacob.

**Esbjerg.** Seaport of Denmark, in Ribe co., Jutland. It stands on the North Sea, opposite the island of Fanø, 56 m. by rly. W. of Fredericia, and is the principal port on the W. Jutland coast. The harbour was built in 1868-74 and is state subsidised. Its exports to Great Britain mainly consist of bacon, beef, cattle, and dairy produce. The fishing and manufacturing industries are important. Pop. 33,155.

**Escalade** (Lat. *scala*, ladder). Medieval method of attacking a fortification. The walls were climbed by scaling ladders or by a staircase or ramp of faggots placed against them.

**Escalator.** A moving inclined continuous stairway, with handrails which move in the same direction and at the same speed as the

Escalator. Diagrammatic view of an escalator as used at underground stations and in department stores  
By courtesy of Waygood-Otis, Ltd.

berg. On the south the range has a precipitous face, but on the north, or Saxon side, it slopes more gradually to the plain. The range, as the name suggests, is rich in minerals, silver, lead, tin, copper, iron, and some gold and uranium being found here. There are holiday

ducting campaigns against Cilicia, Arabia, and Elam, he sacked Sidon, 676, and Memphis, 670. At Shamaal he set up a stela with his portrait in relief, and erected palaces at Nineveh and Calah. His son Ashurbanipal succeeded him. See Sinjerli.

stairs or steps. These steps are carried between two main chains, and each step is provided with four rollers on separate tracks. At the upper and lower landings the tracks are so disposed that the stair formation of the steps on the incline is gradually changed to a flat platform formation, level with the landing. The tread of each step is provided with a series of cleats, which engage with combs at the upper and lower landings.

Escalators are driven by electric motors through suitable gear reduction units, and have brakes by which they may be held stationary when not in use. There are safety devices for stopping the escalator

in the event of excessive speed or accidental reversal. Escalators are of particular advantage where large numbers of persons have to be transported between two levels, e.g. at underground railway stations or in department stores.

**Escallonia.** Genus of evergreen shrubs belonging to the family Saxifragaceae, natives of S.

Escallonia. Foliage and flowers of *Escallonia macrantha*

America. The undivided, leathery leaves are covered with resinous glands which render them somewhat sticky. The tubular white, pink, or red flowers are disposed in small clusters at the ends of branches.

*E. rubra* and *E. macrantha* are much grown in the S. of England near the sea as garden hedges. The shrub is named after Escallon, a Spanish traveller.

**Escanaba.** City of Michigan, U.S.A. The co. seat of Delta co., it is on an arm of Green Bay, Lake Michigan, and lies 116 m. N.N.E. of Green Bay, Wis. It has a rly. station and airport. There are docks for shipping the iron ore of the district, also rly. repair shops. Trade is in fish and charcoal; manufactures include furniture and lumber products. Escanaba was settled in 1846 and made a city in 1883. Pop. 14,830.

**Escape.** Play by John Galsworthy. Produced at the Ambassadors' Theatre, London, Aug. 12, 1926, it shows in a prologue and nine "episodes" the reactions of various people encountered by a convict escaping from Dartmoor in the few hours before he is captured. The prologue establishes initial sympathy for the convict, Matt Denant, a part created by Nicholas Hannen. Sir Gerald du Maurier played the part in a film version, 1931.

**Escapement.** That part of a clock, watch, or chronometer which controls and regulates the motive force, produced by weight or spring, so that correct time may be indicated on the dial. An escapement has two tasks to perform: to allow the teeth of a wheel to escape, or pass a given point, one at a time, so that the motive force is allowed to trickle through in carefully measured and

pre-determined periods of time; and to give impulse to pendulum or balance, so that constant motion will be maintained so long as the motive force continues to operate. Hundreds of escapements have been invented, of which about six have stood the test of time.

The verge escapement was the first of all but is now quite obsolete. Its inventor is unknown, but it was in use for clocks by the 14th century and continued until the middle of the 17th; for watches 100 years longer. In clocks the escape or crown wheel is mounted on the fastest moving arbor. The verge is a vertical arbor, suspended by a cord from a suitable cock and pivoted at its lower end in a bearing. Two pallets project from the verge at right angles to each other, in line with the teeth at the top and bottom of the crown wheel respectively. Higher up on the verge is a horizontal bar, the balance, with a weight at each end, the moving of which nearer to or farther away from the centre makes the balance swing faster or slower. The action of the escapement is simple. The balance is oscillated in one direction, when one of the pallets, which is holding up the rotation of the crown wheel by engaging one of its teeth, is gradually turned on its axis until the tooth it is holding is allowed to escape. By this time the other pallet, set at right angles to the first, has moved into position to catch the next tooth of the crown wheel nearest to it.

Ignoring the virtually obsolete cylinder and duplex escapements, we come to the chronometer escapement. Invented independently by Arnold and Earnshaw about 1782; the Earnshaw version is the better. The balance is almost entirely "free" from interference by the train, except while receiving impulse on alternate vibrations. The most general use is for marine time-keeping. The working of three forms of escapement is shown in the diagrams in this page. The chronometer escapement is shown in Fig. 1. A tooth of the escape wheel A is shown at rest on the locking pallet D. B is the impulse roller, E the foot of the detent. The discharging pallet, shown in

dotted lines, comes in contact with a gold spring J, which, in turn, presses on the end of detent H, forcing it back and bending a spring F, so releasing the escape wheel. A tooth falls on the pallet C, the escape wheel communicates an impulse to the balance, and as soon as the pallet has turned sufficiently to allow the escape wheel tooth to drop off, the tooth in front is caught on the locking pallet D, the detent G having meanwhile sprung back into place immediately on being freed from the discharging pallet.

The lever escapement, invented by Thomas Mudge about 1765, is used in almost all good watches today. The balance actuates a lever by means of a roller, which engages in a notch in one end. As the balance swings the roller carries the lever to one side; one of the pallets allows a tooth of the escape wheel to pass, at the same time giving impulse, while the other holds the wheel up again. The lever escapement generally in use is shown in Fig. 2. The escape wheel A has pointed teeth working into two pallets C C, which have pieces of ruby sunk into their working faces. The pallets are fixed to a lever B, which has a notch at one end engaging with a small pin E set into a roller D, on the axis of the balance wheel. In the figure the impulse pin has just entered the notch of the lever and is

Escapement. 1. Chronometer escapement. 2. Lever escapement. 3. Graham's dead-beat escapement. For descriptions see text

about to unlock the pallet. Energy is imparted to the impulse pin by the balance spring. The movements of the lever are kept within their proper limits by means of pins placed in suitable positions.

**RECOIL ESCAPEMENT.** Invented by Dr. Robert Hooke (1635-1703), this is the most important contribution to timekeeping by pendulum clocks. The pendulum was first applied to the verge escapement, which was mounted horizontally instead of vertically, and this gave much more accurate timekeeping, since the swing of the pendulum was more accurate than that of the foliot which it superseded. Hooke realized that timekeeping by pendulum clocks could never be really good unless the pendulum arc could be much less than the 45-50° required with the verge escapement. He accomplished the anchor escapement, the arc of which could be made as small as 1-2°. The anchor escapement is still fitted to moderately priced pendulum clocks.

**DEAD BEAT ESCAPEMENT.** George Graham (1673-1751) invented this mechanism, which is so fashioned as to allow the escape wheel to drop dead, without recoil, on to the pallet which arrests its further movement. This escapement is expensive and delicate, and is largely used in turret clocks and for regulators. The dead-beat escapement is shown in Fig. 3. A is the escape wheel, B B the pallets. (See page 3135.)

**GRAVITY ESCAPEMENT.** For large public clocks this is now generally employed. With the recoil and dead beat escapements additional weight can cause erratic timekeeping, and when a number of pairs of heavy hands have to be driven, considerable weight is necessary. Wind also can have a serious effect on the hands. In 1854 Sir Edmund Denison (later Lord Grimthorpe) applied "double three-legged escapement" to the clock familiarly known as Big Ben. The principle of the gravity escapement is that the pendulum in its swing unlocks the pallets, while the weight or motive force causes them to be lifted so as to impart impulse. The escape wheel comprises two three-toothed wheels mounted in different planes, while the pallets are two gravity arms mounted above the escape wheel and having studs on their lower ends which bear on the pendulum. Each gravity arm has a projection which engages one of three pins between the double escape wheel, and after one of the pallets has followed the pendulum to its zero point, thus by its weight giving impulse, it is lifted by the motive force turning the escape wheel, and by the pin engaging the projection

on the gravity arm. When the pendulum swings on its return journey it lifts this gravity arm still farther, thus unlocking the escapement, while the other gravity arm is then lifted. The amount of power on the train has no relation to the impulse, which remains as constant as possible.

**Escarpment.** In geology, an asymmetrical ridge formed by gently dipping hard beds which lie between softer strata. The less resistant material is eroded away and the hard rock is left projecting. The precipitous edge of the hard beds is called the scarp-face (*ss*). The gently inclined surface

Escarpment. Diagram illustrating the formation of two escarpments. The lettering is explained in the text

which owes its inclination to the dip of the top of the beds is the dip-slope (*dd*). Valleys or gorges occupied by rivers which cut through escarpments are referred to as water-gaps (*Wg*). Marked notches in the ridge through which past streams, now diverted, may once have flowed are wind-gaps (*W*). With increase in the dip of the beds the dip-slope becomes steeper until it equals the inclination of the scarp-face; the symmetrical ridge so formed is a hog's back. Extensive uplands of escarpment form are known as cuestas. Interbedded soft strata are marked X on the diagram. The steep edges of flat tablelands are sometimes referred to as escarpments. Examples in England are the Cotswold Hills overlooking the Severn; Wenlock Edge; the N. and S. Downs; and the Chilterns. Escarpment-like ridges may be formed by faulting, as in New Zealand and Western U.S.A., where parallel faults have broken the rocks into elongated blocks which have been tilted. Each block is thus bounded by a steep fault-scarp face and a gentle rear- or dip-slope. Mountains formed this way are usually termed block-mountains. See Fault.

**Escaut Line.** Defence line of the Second Great War hastily established on the W. bank of the river Escaut or Schelde (*q.v.*), following the German breakthrough at Maastricht in May, 1940. With its right flank on Ghent and its left on Tournai, the

line was held by the British and Belgian armies from May 11 until May 23, when the German capture of Abbeville so disrupted Allied communications that the line was abandoned and the B.E.F. fell back on the Lys. See British Expeditionary Force.

**Eschatology** (Gr. *eschatos*, last; *logos*, discourse). Term used for that branch of theology which deals with the four last things: death, judgement, the life after death, and the return of Christ to the earth. All ancient religions and some philosophies paid considerable attention to such a doctrine, the teaching of the ancient Egypt-

tians on life after death being especially detailed. The Bible contains little on the subject. The earlier books of the O.T. appear to take for granted that personality will survive death, and gradually unfold the idea of rewards and punishments after death. The teaching of Christ and His apostles emphasised these truths, but added little to our knowledge. Such passages as the parable of the rich man and Lazarus and the descriptions in the book of Revelation are couched in the language of Oriental imagery, and were not intended to be taken literally.

The general teaching of the Christian Church on the subject has been marked by great reserve, with the exception of the Church of Rome in the Middle Ages, when the doctrine of purgatory was developed in detail. The present attitude of theologians is one of opposition to speculation on the subject. See Immortality; Survival.

**Escheat** (Lat. *excidere*, to fall out). Term used in law for the reversion of land to its ultimate owner because there is no other heir. It is a relic of feudal times when land was granted by the king or other lord on the condition that in certain contingencies it escheated or came back to him. Land also escheated when the holder was attainted, the theory being that his blood being thus corrupt, his heirs could not inherit. This, however, was abolished in England in 1870. The majority of escheats fell to the crown. Escheat through failure of heirs was abolished in 1925,

though land like other property may pass to the crown as *bona vacantia* on the death of its owner. See Feudalism.

**Eschscholtz Bay.** Inlet of Alaska. Arm of Kotzebue Sound, Bering Strait, near the Arctic Circle, its name commemorates J. F. Eschscholtz, Russian naturalist.

**Eschscholtzia.** Botanical name for the genus containing the perennial herb Californian poppy (*q.v.*).

**Eschwege.** Town of Germany. It stands on the Werra, 38 m. E.S.E. of Kassel, in the Land of North Rhine-Westphalia. The old buildings include a 14th century castle, restored in 1581, and the tower of an 11th century monastery. The industries include weaving and tanning. The town was part of Hesse from 1264 until taken by Prussia after the war of 1866. Pop. 13,700.

**Eschweiler.** Town of Germany, in North Rhine-Westphalia. It is on the Inde, 8 m. E.N.E. of Aix-la-Chapelle, and stands on a large coalfield. The chief industries were the manufacture of iron, steel, and zinc goods, engineering, brewing, and tanning. Captured by American troops after three days' hard fighting, on Nov. 22, 1944, it was lost again in the Ardennes counter-offensive, to be recaptured by the U.S. 3rd army on Jan. 22, 1945. Pop. pre-war 33,090.

**Escobar y Mendoza, ANTONIO** (1589-1669). Spanish philosopher. Born at Valladolid, he entered the Society of Jesus and gained fame as a popular preacher. In his *Summula Casuum Conscientiae*, 1627, he formulated the maxim that the end, if pure, always

justifies the means, even when the actions may be immoral or illegal. This statement was satirised by such writers as Pascal, Molière, La Fontaine, and Boileau. In France indeed Escobar's name gave rise to the term *escobardeerie* for moral laxity. He died July 4, 1669, at Valladolid.

**Escombe, HARRY** (1838-99). South African politician. Born July 25, 1838, and educated in London, he emigrated to the Cape in 1859 and joined the commercial staff of the Natal Mercury. In 1872 he was elected to the legislative council of Natal. He fought through the Zulu (1879) and Transvaal (1881) wars, and defended Dinizulu successfully against the charge of rebellion. In 1893 he was made attorney-general and devoted himself to developing the commercial resources of the colony. Elected premier in 1897, he came to London for the queen's diamond jubilee. He died Dec. 27, 1899. His collected speeches appeared 1903.

**Escott, THOMAS HAY SWEET** (1844-1924). A British author. Born at Taunton, he was educated at Queen's College, Oxford. Lecturer in logic and deputy-professor of classical literature at King's College, London, 1866-73, he edited the *Fortnightly Review*, 1882-86, and was for many years leader writer on the *Standard*. His books include *England: its People, Polity, and Pursuits*, 1870; *Social Transformations of the Victorian Age*, 1897; *The Story of British Diplomacy*, 1908; *Masters of English Journalism*, 1911; *Great Victorians*, 1916; *National and International Links*, 1922. He died June 14, 1924.

**Escrow.** Deed delivered by the person executing it to some third person on the terms expressed either in writing or by word of mouth that the deed is not to be delivered to the other party to it or become effective unless some condition is fulfilled—*e.g.* that the purchaser of land conveyed by the deed shall have paid the purchase money. A deed cannot be delivered as an escrow to the other party to the deed or to his agent.

**Escudo** (Port., shield). Silver coin, monetary unit of Portuguese currency since May 22, 1911. Divided into 100 centavos, it replaced the old milreis gold piece. In 1950 the official exchange rate was 80½ escudos to the £1 sterling. There are coins of 10, 5, and 2½ escudos. The shield with the national arms is on the obverse. In Spain, a silver escudo, equal to 10 reals, was used 1864-68.

**Escuintla.** City of Guatemala, 50 m. S.E. of Guatemala City and reached by rly. or motor road. In a fertile tropical valley, it produces grain and fruit. At Concepción, 2 m. distant, is an airport. Pop. 47,400.

**Escorial** (Span. *El Escorial*). Palace and monastery of Spain, situated 31 m. by rly. N.W. of Madrid, on a spur of the Guadarrama mts. It was designed for Philip II of Spain by Juan Bautista de Toledo, the first stone being laid April 23, 1563. His pupil, Juan de Herrera, carried on the work, which was completed Sept. 13, 1584. Philip dedicated the building to S. Lorenzo in commemoration of his victory over the French on that saint's day, Aug. 10, 1557. Intending it to be

Escorial. Spanish palace and monastery, covering nearly 400,000 sq. ft., seen from the north-west. In the centre is the great church, and the palace, college, and convent occupy parts of the surrounding buildings

a retreat in which he could meditate upon his own end, he ordered that the structure should be of the plainest character.

It is built of grey granite, in the severest Doric style. The plan is that of an immense rectangle, with a comparatively small rectangular wing, embodying the Palace of the Infantas, projecting beyond the E. side. The façades are pierced by rows of small rectangular windows, each row marking a storey. At each of the four angles of the main structure is a tower with pyramidal spire; there are two church towers 230 ft. in height, with the great dome of the church crowning the whole. The main entrance, in the centre of the W. front, is severely Doric, in keeping with the façade. The door itself is 20 ft. high by 10 ft. wide; above it is a colossal statue of S. Lorenzo, the work of the sculptor Monegro. The head, hands, and feet of this statue are wrought in white marble, but the rest of the figure is granite. This entrance leads into a vestibule 75 ft. wide, flanked on the right hand by the convent, including library and refectory, and on the left by the college.

The central space is occupied by the church, the plan of which was based on the original one of S. Peter's, Rome. The dome and lantern are carried on four enormous piers, from which spring the arches of the three naves. Below the high altar is the famous Pantheon of the kings and queens of Spain, beginning with Charles V. The decoration of this octagonal chamber, consisting of precious marble linings, dates from 1654. There are 26 sepulchral urns of dark marble. Distributed over the church are paintings by Tintoretto, Titian, El Greco, Zurbaran, and Ribera in the sacristy, and the masterpieces of Coello in the chapels.

On the N. side is the palace, in the N.E. corner of which were the apartments of Philip himself. In the room in which he died was a panel, by opening which the king could look down upon the high altar of the church. Other apartments of the palace were added to and embellished by later monarchs. There are tapestries after Goya and Teniers. Philip II was the founder of the Escorial library. Don Diego de Mendoza, the Inquisition, and Augustin, archbishop of Tarragona, were other donors, the collection being further increased by confiscated libraries, and by the rule that a

copy of every book published in Spain should be presented to it.

The Hermits of S. Jerome were the first tenants of the monastery, which was stormed in 1808 by French troops; only part of the looted treasure being restored at the peace of 1814. In 1885 Augustinians occupied the monastery.

The Escorial was not damaged in any way during the Spanish civil war of 1936-39.

**Escutcheon** (old Fr. *escuchon*, Lat. *scutum*, shield). In heraldry, term used to describe a shield blazoned with armorial bearings or other insignia. See Shield.

**Esdraelon**, PLAIN OF. District of Palestine. It is sometimes called the plain of Jezreel, a term which applies more specifically to its eastern extension towards the Jordan. An historic tract of country, it has been the scene of many battles, from Gideon's victory over the Midianites to the actions fought by Allenby's cavalry in his conquest of the Holy Land during the First Great War. It lies S.E. of Haifa, between Mt. Carmel and the MOUNTAINS OF GILBOA, in N. Palestine,

Literature in the O.T. Apocrypha. 1 Esdras was used by Josephus, and may have been composed in the first century B.C. 2 Esdras was probably written in the reign of Domitian (A.D. 81-96). The author appears to have witnessed the destruction of Jerusalem in A.D. 70 (chap. 3); and in the Eagle Vision the eagle seems to represent Rome.

**Eserine Sulphate**. Sulphate of an alkaloid extracted from *Physostigma venenosum*, the Calabar bean. It produces contraction of the pupils, and in minute doses is useful in various affections of the eye. In large doses it is poisonous.

**Esh**. Village and parish of Durham, England. It is 5 m. W. of Durham, and is a mining centre. Near here, at Ushaw, is the R.C. college of S. Cuthbert, the successor of the one at Douai. It has a collection of pictures and antiquities, while its chapel was designed by Pugin. S. Michael's is the chief church of Esh. Pop. 1,100.

**Esher**. Urban district of Surrey, England, a residential suburb of London. Esher parish stands

Esher, Surrey. The main Portsmouth road looking towards Guildford. In the centre of the picture is the old Bear Hotel, set back from the highway

and is the Armageddon of the Apocalypse. Watered by the Kishon, the plain is very fertile.

**Esdras**, THE BOOKS OF. Several works bear the title Esdras. One of these (O.T. Apocrypha) contains substantially the same materials as the Biblical books known as Ezra, Nehemiah, and 2 Chronicles. In the Septuagint and in the Latin and Syriac versions this is called 1 Esdras; but in Latin bibles since the time of Jerome, 3 Esdras (the O.T. books of Ezra and Nehemiah being reckoned as 1 and 2 Esdras). Modern scholars prefer to call it "Greek Esdras." The other work in the O.T. Apocrypha is commonly called 2 Esdras, but sometimes 4 Esdras. It contains seven visions, and is the only specimen of Apocalyptic

on the Portsmouth Road near the little river Mole. Pleasantly situated, it is 15 m. S.W. of London by electric rly. Esher Place beside the Mole, built by William of Waynflete in 1460, and now represented by a tower (ruined, then restored), was the residence of Wolsey after his fall in 1529. One mile S. is Claremont (q.v.). The urban district includes Claygate, Cobham, E. and W. Molesey, Hinchley Wood, Stoke D'Abernon, Oxshott, Thames Ditton, and Long Ditton. Pop. est. 47,900.

**Esher**, WILLIAM BALIOL BRETT, 1ST VISCOUNT (1817-99). British judge. The son of a clergyman, he was born Aug. 13, 1817, and went from Westminster School to Caius College, Cambridge. In 1840 he became a barrister, and he entered

the house of commons as Conservative M.P. for Helston in 1866, a tie at this election ending in the house allowing both candidates to sit. In 1868 Brett was made solicitor-general, but very soon he left political life to become a judge of the court of common pleas. In 1876 he was promoted to be a lord justice, and in 1883 to be master of the rolls. He retired in 1897, and died May 24, 1899. In 1885 Brett was made Baron Esher and in 1897 a viscount.

**Esher, REGINALD BALIOL BRETT, 2ND VISCOUNT** (1852-1930). British politician. Born

2nd Viscount Esher  
British politician

in London, June 30, 1852, he was the son of the judge created Viscount Esher (v.s.). Educated at Eton and Trinity College, Cambridge, he was Liberal M.P. for Pen-

ryn and Falmouth 1880-85. He was secretary to the office of works 1895-1902, and enjoyed the confidence of both Victoria and Edward VII, under whom he was deputy-governor of Windsor Castle. Esher took a great interest in the Territorial Force, and was on the committee of imperial defence. His publications include *Ionious*, 1923; *Cloud-Capped Towers*, 1927; and, with A. C. Benson, he edited the *Letters of Queen Victoria*, 1907. Dying Jan. 22, 1930, he was succeeded by his son Oliver (b. 1881). Another son, Maurice V. Brett, published his *Journals and Letters*, 1934.

**Eshowe.** Town of Zululand, Natal. It is 40 m. S. of Ulundi, and there are asbestos mines in the neighbourhood. It was besieged for a time by the Zulus during the Zulu War of 1879. Here Cetywayo died in 1884. Pop. 52,929.

**Esk.** River of Great Britain. Formed by the confluence of the Black Esk and White Esk, which meet in Eskdalemuir, it flows for 35 m. through Dumfriesshire and Cumberland to the Solway Firth, about 5 m. below Longtown.

**Esk.** River of Cumberland, England. It rises between Scafell Pike and Rossett Crag and flows about 15 m. generally S.W. through Eskdale to reach the Irish Sea at Ravenglass. The Forestry Commission in 1945 proposed to form a national park in Eskdale.

**Esk.** River of the N. Riding of Yorkshire, England. Rising to the

N. of Burton Head, it flows N. and then generally E. across Cleveland, through beautiful woodland scenery, for some 20 m., entering the North Sea between high cliffs at Whitby.

**Esk.** River of Midlothian, Scotland. It is formed by the junction of the N. Esk and S. Esk in Dalkeith Park, flowing thence to the Firth of Forth at Musselburgh.

**Esk, NORTH.** River of Kincardineshire and Angus, Scotland. It is formed by the junction of the Lee and Mark, which unite at Invermark, and flows S.E. for 29 m. to the North Sea,  $4\frac{1}{2}$  m. N.N.E. of Montrose.

**Esk, SOUTH.** River of Angus, Scotland. It rises in the Grampian Mts. above Glen Clova, and flows 49 m. S.E. and E. to the North Sea at Montrose.

**Esker** (Irish *eskar*). Long, winding ridge of coarse gravel and sand. Formed by torrents of water released from glaciers, eskers are situated in areas formerly occupied by ice-sheets.

**Eskestuna.** Town of Sweden, in the prov. of Södermanland. It stands on the Hjelmars river, between the Mälars and Hjelmars lakes, 65 m. by rly. W. of Stockholm. Known as the Sheffield of Sweden, it has iron-foundries, steel works, a royal arms factory, and a technical school. It is celebrated for its cutlery and damascened work. Named after S. Eskil (d. 1181), the English apostle in Södermanland, its 12th century monastery was destroyed by fire in 1680. Pop. 45,245, the ninth town in Sweden.

**Eskimo** (Abenaki, raw flesh-eater). Primitive race inhabiting Arctic America. Numbering perhaps 30,000, they have a geographical range of 5,000 m., the widest of any aboriginal race in the world. The Danish form Eskimo has displaced the French Esquimaux. The Hudson Bay "husky," used of man and dog, is a colloquial variant. The native name is Innuvit (men). Long-headed, broad-faced, lank-haired, and of a yellowish brown colour, they may have originated in prehistoric Europe. Besides their seal-food, they still hunt musk-ox and reindeer. Their bone arrow-heads, harpoons, shaft-straighteners, and ornaments, their stone lamps and ivory engravings—almost reaching picture-writing—support this view, which, however, has recently been contested in favour of relationships more definitely mongoloid. That they crossed by the Bering Strait is undisputed, so that a pre-American

habitat in N. Siberia is a reasonable inference. The claim that they extended at one time to the Scandinavian, and even to the N. coasts of Britain, is less fully established. Their one-man skin canoes (kayak), transport boats (umiak), summer tents of skin, winter huts of turf stone, migrant snow-houses (igloo), harpoon floats, dog sledges, cairn-burials, all show intelligent adaptation to adverse conditions.

The language-stock, with its many dialects, attests a long ancestry, anterior to their American advent. Their animism embraces a crude magic, governed by medicine-men (angakok), akin to African witch-doctors rather than Siberian shamans. Their communal life recognizes no national chiefs; tribal warfare is unknown. Their ample folklore points to a belief of some tribes in a woman of the sea, perhaps Scandinavian, of others in a moon-god. The Aleuts of the Aleutian Islands are a self-contained branch of the race, exhibiting traces of Asiatic rather than American Indian contact. A tribe of blond Eskimo was discovered by Stefansson during his 1909-11 expedition on Coronation Bluff, far in the Arctic Zone. See *Aborigines*.

**Bibliography.** The Central Eskimo, F. Boas, 1888; The People of the Polar North, K. Rasmussen, compiled from the Danish by G. Herring, 1908; The Labrador Eskimo, E. W. Hawkes 1916; Eskimo-Land Speaks, W. van Valin, 1945.

**Eskimo Dog.** Breed of dogs kept by the Eskimos of Arctic America. They are little more than domesticated wolves of the region. The practice of crossing

Eskimo man in  
hunting dress

Eskimo Dog. Specimen of the  
breed, closely akin to the wolf

the females with wild wolves tends to check those modifications which domestication produces. The Eskimo dog has a sharp muzzle, upright ears, rough coat, and a bushy tail. Though usually of the colour of the wolf, black-and-white specimens are not uncommon. Like the wolf, it does not bark, but howls. The dogs are fed on frozen fish, but in spring often find birds and eggs. Their usual drink is snow. They are employed for sledge drawing, about eight being yoked together. When the going is good a dog will draw on an average over 300 lb. for 35 m. in a day. See Dog colour plate.

**Eskishehr** or **ESKISEHIR** (Turk., old city). Fifth town of Asiatic Turkey, the ancient Dorylaeum. This capital of a vilayet with the same name, with its rich deposits of meerschaum and trade in pipes in that material, stands on the Pursak Su. It is the junction at which the main rly. from the Bosphorus divides into two, one branch going E. to Ankara and the other S.W. to connect on the W. with the Izmir rly. and on the E. with the Bagdad rly. The town has sulphur springs (122° F.). The battle of Dorylaeum, July 1, 1097, was a notable victory for the Crusaders over the Turks. Pop., town, 80,096; vilayet, 206,794.

**Esla**. River of Spain. It rises on the S. slopes of the mts. of Asturias, in the N. part of the prov. of Leon, and flows a generally S.S.W. course to discharge its waters into the Douro, 16 m. W. of Zamora. It has a length of 120 m.

**Eslava**, MIGUEL HILARION (1807-78). Spanish composer. Born near Pampeluna, Oct. 21, 1807, he became master of the choir in Ossuña cathedral in 1828. He moved to Seville in 1832, and was appointed *maestro* at the cathedral, and to a similar position at the court of Isabella in 1844. He died at Madrid, July 23, 1878. He wrote three operas, *El Solitario*, 1841; *Las Treguas de Toleda*, 1842; *Pedro el Cruel*, 1843; and about 150 masses and pieces of ecclesiastical music.

**Esmerch**, JOHANNES FRIEDRICH AUGUST VON (1823-1908). German surgeon. Born Jan. 9, 1823, at Tönning, Schleswig-Holstein, he served in the wars of 1848 and 1864, and, in the Franco-Prussian war, 1870-71, was surgeon-general to the army. He specialised in hospital management and military surgery. He invented an indiarubber bandage for field work and temporary dressing. He died at Kiel, Feb. 23, 1908.

**Esmeraldas**. Maritime dept. of N.W. Ecuador, lying S. of Colombia. The surface is broken and hilly, but there are the open pasture valleys of the Esmeraldas, Cayapas, and other rivers. The hills are heavily forested, yielding many kinds of timber, also tobacco. Although the mineral resources have not been largely exploited, gold and platinum are found. Area, 5,464 sq. m. Pop. 58,950. Esmeraldas, the capital, is a Pacific port at the mouth of the Esmeraldas, 96 m. N.W. of Quito. It manufactures tobacco and exports rubber, cacao, sugar, fruit, and cattle. Pop. 4,000.

**Esmond**, HENRY. Central character in Thackeray's novel of the same name. Its full title is *The History of Henry Esmond*, a colonel in the Service of Her Majesty Queen Anne, Written by Himself. Published in 1852, it is a masterly presentation of early 18th century life and manners; the illusion as to its having been written by a man of the very time with which it deals is brilliantly sustained. The hero tells his own story from boyhood. It not only includes an account of the campaigns of Marlborough, but introduces the finely conceived character of the wayward Beatrix, most imperious of mistresses, true to her period and fascinating for all time.

**Esmond**, HENRY VERNON (1869-1922). Stage and pen name of Henry Vernon Jack, British dramatist and actor. He was born at Hampton Court, Nov. 3, 1869, was educated privately, and went on the stage in 1885. He was the author of many plays, some of which enjoyed considerable popularity: *Bogey*, 1895; *One Summer's Day*, 1897; *The Wilderness*, 1901; *Under the Greenwood Tree*, 1907; *A Young Man's Fancy*, 1912; above all, *Eliza Comes to Stay*, 1913 (previously called *Sandy and His Eliza*); *The Dangerous Age*, 1914. He died April 17, 1922.

**Esneh** or **ESNA**. Town of Egypt. It is on the left bank of the Nile, 36 m. by rly. above Luxor. It is identical with the *Tesnet* of ancient Egypt, but was called *Latopolis* by the Greeks, after the locally venerated *latos* fish. The chief object of interest is the temple of Khnum, which was embellished by Roman emperors from Titus to Decius (251). A subterranean Coptic church was identified here in 1895. The barrage at Esneh ensures irrigation for a large tract of land.

**Espagnols-sur-Mer** (Fr., Spaniards on the sea). Name given

to a sea fight that took place off Winchelsea between the English and the Castilians, Aug. 29, 1350. The two peoples were not actually at war, but the Castilians had helped the French in the war then raging. Moreover, acts of piracy had been committed on both sides.

The sequel was an attack on a Castilian fleet of armed merchantmen as it was returning from the Netherlands to Spain. Under the command of Edward III the English fleet was assembled at Winchelsea, and there the Castilians, nothing loth, joined battle with them. This was rather an encounter of soldiers than of sailors. Crossbowmen on the Castilian ships did much execution, and as the English and Castilian ships lay side by side, the crews fought hand to hand. In the cog *Thomas*, King Edward and his nobles took a gallant part, and this ship was sunk just as the royal party had boarded an enemy vessel. Forty or fifty ships were engaged on either side, the Castilians being the larger. Night, rather than a decision, put an end to the combat, which is described by Froissart.

**Espalier** (Fr.). Shape or form of fruit-tree which has been trained from its earliest or budded

Espalier. Pear tree trained to grow in this way upon a trellis

stage. An espalier consists of a main root stem, the original stock, from which fruit branches in tiers extend horizontally right and left, one above another. During the year after budding, when the side-shoots make their appearance, all should be removed except three, which should be grouped close together. One of these shoots is trained upwards to form a continuation of the main stem, and the remaining couple are coaxed by sticks and strings to grow right and left, parallel with the surface of the ground. When the main stem produces three more buds suitably situated the process is repeated at a distance of about one foot above the original tier. The

word seems to have originally denoted the trellis-work on which the trees were trained.

**Espartero**, BALDOMERO (1792-1879). Spanish soldier and statesman. Born Feb. 27, 1792, at Granada, Ciudad Real, of humble parentage, he fought against Napoleon in Spain, and afterwards against the rebels in S. America. Again in Spain, he obtained several successes against the Carlists, and in 1839 concluded the treaty of Vergara which ended the wars. Turning to politics, he became prime minister, and during 1841-43 was regent, but he fell from power and passed the next few years as an exile in England. Pardoned, he returned to Spain in 1848, and during 1854-56 was again premier. In 1868 he was put forward as a candidate for the throne, and later was made prince of Vergara. He died Jan. 9, 1879.

B. Espartero,  
Spanish soldier

until Esperanto was known and used to some extent in most civilized countries.

There are textbooks in some 80 languages, and 60 Esperanto periodicals are published. There is a flourishing literature, both original and translated: the catalogue of the British Esperanto Association library has over 10,000 entries. Among international language schemes Esperanto leads the field in the number of adherents, practical use, and extent of literature. This is partly because, on an unchanging basis, it is free to develop in any way shown by life and experience to be desirable. Esperanto is easily learned; every rule is without exception, the spelling is phonetic, and the vocabulary (consisting of the commonest European roots) surprisingly small. In structure, the language is not inflected, but agglutinative, which helps to account for its success in countries like Japan.

The following are the terminations of words: -o, noun; -a, adjective; -j (*pron.* like English y) plural; -n, objective (accusative); -e, adverb; -i, infinitive; -u, imperative; -as, present tense; -is, past; -os, future; with similar terminations for active and passive participles. 35 affixes are employed to form derivatives: e.g. -il, instrument (*haki*, hew, *hakilo*, axe); -ist, habitual occupation (*boto*, boot; *botisto*, boot-maker). Compounds are formed by combining roots: *domo*, house, *besto*, animal, *dombesto*, domestic animal. There is a table of correlative words—demonstrative, indefinite, universal, negative, and relative.

International congresses have been held yearly (except in wartime) since 1905. Control is by an international language committee of 100. National societies exist in most lands for local propaganda. All unite for common purposes in a central International Esperanto League (headquarters in 1947 at Heronsgate, Rickmansworth, Herts).

Esperanto is taught in schools and colleges, for its own sake, as a means of acquiring a better knowledge of grammar, and as an approach to the study of other languages. In England demonstration lessons are given in a hundred schools yearly. It has been used in international radio, though not by the B.B.C. It has government support in various countries, e.g. in Brazil. The headquarters for the British Empire is The British Esperanto Association, Inc., 140,

Holland Park Avenue, London, W.11. Consult *The Language Problem*, E. D. Durrant, 1943.

**Esperanza**, LA. Town of Honduras, capital of the dept. of Intibuca. It stands on a plateau at an alt. of nearly 5,000 ft. above sea level, 45 m. W.N.W. of Tegucigalpa. The Indian city of Intibuca is adjacent.

**Espinal**. Town of Colombia, in the dept. of Tolima. It stands at an alt. of 1,020 ft., 25 m. N. of Purificación, and 75 m. S.W. of Bogotá. It is the centre of an agricultural district, producing coffee, cocoa, and tobacco, and manufactures pottery.

**Espionage** (Fr. *espion*, spy). Clandestine collection of information. Espionage may be of a private character to obtain information regarding the conduct of an individual or the progress of a business transaction, such transactions generally being in the hands of a private detective. Political espionage is frequently practised by governments to keep them informed of the activities of their political opponents and to acquaint them with the state of public opinion. A network of secret police and internal espionage is essential to dictatorships for the suppression of criticism or acts threatening the stability of the regime.

The term most commonly refers to the organized employment of secret agents by governments to obtain information concerning other countries, particularly relating to military strength and war potential, which cannot be obtained by open methods. Espionage is conducted by three types of spy: the person who spies for his country from patriotic motives; the traitor who sells his country's secrets for political reasons or for monetary gain; and the person of doubtful character and any nationality who is ready to undertake anything in order to earn money rapidly.

Spies caught in wartime are tried by civil or military courts and generally sentenced to death. In peace heavy penalties of fine and imprisonment are imposed. Attempts have been made at international conferences, notably at Brussels in 1874 and The Hague in 1907, to arrive at a proper definition of spying and a uniform code of rules for its suppression. Conferences drew up a scale of procedure for the trial and punishment of spies, but not all countries accepted the recommendations or observed them in war.

**Esparto Grass** (*Stipa tenacissima*). Tall perennial grass of the family Gramineae. It is a native of S. Europe and N. Africa, where it grows in rocky soil. Its leaves are rolled in from the edges, so that they appear threadlike. Being tough and wiry, it is used in the manufacture of ropes, mats, and a durable kind of paper. For the latter purpose many thousands of tons of the grass were before the Second Great War imported into Great Britain annually. As a crop it yields about 10 tons per acre. See Paper.

Esparto Grass

**Esperance**. Harbour of W. Australia. It is situated on the S. coast, 220 m. N.E. of Albany. Gold from Coolgardie is shipped from here.

**Esperanto** (Span. *esperanza*, hope). International auxiliary language originated by Dr. L. L. Zamenhof of Warsaw (1859-1917), and developed by 60 years' worldwide use. The first book was published in 1887. In the first 30 years Esperanto met with indifference, criticism, and active opposition arising mainly from ignorance of the language and its aims. Then came steady progress,

Military espionage is almost as old as warfare; instances occur in the Bible and spies are mentioned by classical authors such as Xenophon and Caesar. Espionage became highly organized in the 17th century in England under Cromwell and in France under Richelieu. Frederick the Great employed spies, and Napoleon's system reached great efficiency under General Savary. Under the direction of Stieber, the 19th century Prussian spy organization prepared the way for the campaigns preceding the establishment of the German Empire. Its work facilitated the triumphal march of the Prussians to Sadowa in 1866, and at the outbreak of the war with France in 1870 the Germans had 30,000 spies behind the French lines. Japanese victory over Russia in 1905 was due in great measure to the large number of Chinese spies working for Japan in Manchuria.

Espionage was practised on a large scale by all belligerents in the First Great War. The Germans were helped by the large numbers of their nationals settled in foreign countries, the eastern departments of France being riddled with German agents. Neutral countries became clearing centres for spies employed by all belligerents. One of the most notable spies employed by Germany was the Javanese woman, Mata Hari, who was caught by the French and shot at Vincennes. Carl Lody, a German ex-officer caught spying in England, was shot. At the outbreak of the Second Great War, Germany had an even more intricate network of espionage operating throughout the world, often working in cooperation with Fifth Column (*q.v.*) organizations. Great Britain during the war sentenced to death 16 spies: four each British, German, and Belgian, three Dutch, and one Portuguese.

**Espirito Santo.** Maritime state of S.E. Brazil. It is bounded N. by Bahia, W. by Minas Geraes, E. by the Atlantic, and S. by Rio de Janeiro. Hilly in the interior and on the W., where run the Serra dos Aimores and the Serra do Mar, elsewhere it is level, and in parts marshy. Well watered by the Rio Doce and its tributaries, it produces coffee, sugar, cocoa, tobacco, rice, and salt; its forests yield valuable timber and drugs. The Parahyba do Sul flows along the S. boundary. The mining resources of this region are not yet tapped, but deposits of iron ore are known to exist. Three rlys. serve the state.

The capital is Vitoria, on the bay of Espirito Santo. The first Portuguese settlement was made in 1535. Area 17,308 sq. m. Pop. est. 851,000.

**Espirito Santo.** Largest and westernmost of the New Hebrides, Pacific Ocean, in lat. 15° S., long. 167° E. It is 65 m. long by 20 m. wide, and mountainous, attaining an altitude of over 5,000 ft. Maize, coconuts, millet, coffee, and bananas are grown. Trade is mostly with Sydney. The island was an Allied naval base in the Second Great War. Area, 1,850 sq. m.

**Esprit des Lois, DE L'.** Title of a great work by Montesquieu. It is divided into 31 books, each of which contains a number of short chapters, some only a few lines in length, and made a big quarto volume. Published anonymously at Geneva in 1748, it has been many times reprinted. It is a comprehensive survey of the nature of laws and government "almost unique in its entire freedom at once from doctrinairism, from visionary enthusiasm, from egotism, and from an undue spirit of system." Its contents may be expressed by its sub-title, "the relation which laws should have to the constitution of every government, to manners, climate, religion, commerce, etc."

**Espronceda, JOSÉ DE** (1808-42). Spanish poet. Born March 25, 1808, near Almedralejo, Estremadura, he was educated at the college of S. Matthew, Madrid, and before the age of 15 was imprisoned as a member of a revolutionary secret society. On returning to the capital he found himself suspect, and after a further spell of incarceration escaped to England. In London he studied Shakespeare, Milton, and Byron (by whom he was most markedly influenced), and while there wrote his fine ode *A la Patria* (1829). In 1830 he was in Paris, fighting in the brief revolution there. On the amnesty after the death of Ferdinand, 1833, he returned to Spain and entered the queen's bodyguard, but was cashiered for writing a political song. Journalism, novel-writing, and various revolutionary movements occupied him for a few years, and in 1841 he became secretary of the embassy at the Hague. In 1842 he returned to take his seat in the cortes as deputy for Almeria. He died May 23, 1842.

Showing early gifts as a poet, he gained a leading position among 19th century Spanish writers, and his influence on his successors was

marked. His best work was of a lyrical and self-revealing character, as is seen in the Don Juan-like narrative, *The Student of Salamanca*, and the Faust-like *The Devil-World*. See Spain: Literature; consult also History of Spanish Literature, J. Fitzmaurice-Kelly, 1898.

**Esquiline Hill** (*Mons Esquilinus*). The highest of the "seven hills" on and around which ancient Rome was built. Lying between the Caelian and the Viminal, in the original city it was regarded as including the Oppian, Cispian, and Fagatal. On the Esquiline were the Colosseum (*q.v.*), on the site of the Golden House of Nero, and the *thermae*, or warm baths, of Titus and Trajan. See Rome.

**Esquimalt.** Port of British Columbia, Canada. It is on Vancouver Island, 3 m. from Victoria. It has a magnificent harbour and is the Pacific coast headquarters of the Canadian navy, with one of the largest dry docks in the world. There is a dockyard and other naval establishments. The town is served by rlys. The industries include shipbuilding and oyster culture. Pop. 3,128.

**Esquire** (old Fr. *escuyer*, shield-bearer). Title of honour. The word, originally denoting one who bore the shield for a knight, became a title of honour below the rank of knight. Among those legally esquires are sons of peers, the eldest sons of baronets and knights, justices of the peace, and barristers. All men except those possessing a title by status or rank are in practice addressed in writing as esquire (abbreviated Esq.). An American magazine of this name was first published in Chicago in 1933.

**Essad, AHMET, PASHA** (1863-1920). Albanian soldier and politician. Descended from the Top-tani family, hereditary claimants to the Albanian kingship, Essad entered the Albanian army, served in Macedonia and Albania on the side of Turkey, and was rewarded for services against Greece, 1897, with the title of pasha. The assassin of Essad's brother, hired by Abdul Hamid, was slain by Essad, but soon after the sultan made him commander of *gendarmérie* at Janina.

In 1908 Essad headed the depuration which announced to Abdul his deposition, and in the Balkan war of 1912 heroically defended Soutari against the Greeks. During the short reign of Prince William of Wied as mpret, Essad was the real ruler of Albania and

attempted an abortive *coup d'état*, was arrested but released, and after the mp̄ret's departure made himself head of the provisional government, Oct. 5, 1914.

In Jan., 1916, he sided with the Allies. In Feb. the Austrians overran Albania, and Essad escaped to Salonica. His connexion with the Serbians, whom he had aided in their 1915 retreat, made him distasteful to the Italians who occupied Albania after the Austrian retreat, 1918, and he was not allowed to return there. He lived for some months in Paris, and was murdered by an Albanian student, June 13, 1920. *See* Albania.

**Es Salt.** Village of Transjordan. Identified as the ancient Ramoth (Deut. iv, 43; Josh. xx, 8), it is 15 m. N.E. of the crossing of the Jordan at El Ghoraniyeh, 20 N.E. of the N. end of the Dead Sea. Situated at an elevation of 2,740 ft. above the sea, it is the capital of the Kadā (division) of El-Belkā. Wine and raisins are produced in the district. The inhabitants are two-thirds Moslems, the rest Greeks, Protestants, and Roman Catholics. During the First Great War it was a depot of the Turks, who when they retired from it, April 1, 1918, brought away some thousands of Jewish, Syrian, and Armenian refugees. On April 30 Allenby resumed operations E. of the Jordan, and Australian mounted troops entered Es Salt. It was evacuated May 3, when Allenby withdrew his whole force to the Jordan crossings. *See* Palestine, Conquest of.

**Essay** (Fr. *essai*, attempt; Lat. *exigere*, to examine). Literary composition, generally in prose, of a short and informal character. The origin of the word is the same as that of assay, for at first it was taken as indicating a testing or trying of a subject. The word has, however, at different times been applied to a great variety of compositions, embracing at once the sententious brevities of Bacon and the fullness of such a philosophical work as that of Locke, On the Human Understanding. It is also applied to certain of the didactic poems of Pope.

Montaigne (16th century) is generally regarded as the originator of the modern essay, as he was the first to employ the word as title for his pleasantly discursive and personal writings; yet, as Bacon, the earliest notable master of the English essay, wrote, "the word is late, but the thing is ancient." Bacon's Essays, 1597, are mainly a succession of pithy maxims, and differ greatly from the essay as it was evolved during the succeeding centuries; for it was rather from

the Frenchman than from their countryman that the English essayists derived. Ignoring its use as something of an apologetic prefix to philosophical and historical studies, and its employment in poetry by Pope and some of his imitators, the history of the essay in English literature may be followed in a record of some of its exponents.

Abraham Cowley, the first English author to write in the easy, familiar, personal style of Montaigne, though he frequently rounded off his essay with a poem on its theme, or wrote the essay as little more than introduction to a poem, may be called the father of the familiar essay in English. It was with Richard Steele and Joseph Addison that the essay established itself as a popular form of literary composition. Their personal studies in essay form in *The Tatler* and *The Spectator* are regarded as adumbrating the English novel; as two laughing philosophers, with their genial comment on men and affairs in periodical essays, they established a form of the composition which continued throughout the 18th century.

In the hands of Daniel Defoe early in that century, the periodical essay received that particular bent out of which developed the newspaper leader. Towards the middle of the century the periodical essay was revived in *The True Patriot*, *The Rambler*, *The Covent Garden Journal*, *The Adventurer*, *The Idler*, *The Bee*, *The Citizen of the World* and many more, and found its most notable writers in Henry Fielding, Samuel Johnson, and Oliver Goldsmith. These various works were brought together in *British Essayists*, with prefaces by A. Chalmers, 45 vols., 1817.

With the 19th century the essay branched more definitely into two main kinds, both already, but less distinctly, differentiated, the familiar and the critical essay. Of the writers of the former kind the greatest exemplar is Charles Lamb, whose *Essays of Elia*, 1823, *Last Essays of Elia*, 1833, and uncollected essays may be said to have influenced many of his successors up to the present day. At the same period William Hazlitt was writer of essays of a more robust character, and Leigh Hunt was master of a dainty, graceful essay style, less charmingly individual than that of Lamb. The critical essay received a stimulus from the establishment of the quarterly reviews and the rapid growth of the magazines, Francis Jeffrey, Sydney Smith, and Thomas Babington Macaulay being among its most notable exponents.

Bulwer Lytton, W. M. Thackeray, J. A. Froude, Matthew Arnold, all favoured the essay form at times, but names that come more readily to the mind today in thinking of English essayists are R. L. Stevenson, Austin Dobson, Augustine Birrell, Alice Meynell, A. C. Benson, E. V. Lucas, Hilaire Belloc, G. K. Chesterton, Robert Lynd, A. A. Milne, J. B. Priestley, Aldous Huxley, and notably that charming exponent of the form, Violet Paget, famous as "Vernon Lee." Among later English writers who are essayists rather than literary critics, George Orwell is outstanding. In America, Ralph Waldo Emerson has been the most eminent essayist, though Oliver Wendell Holmes, James Russell Lowell, Hamilton Wright Mabie, Agnes Repplier, Paul Elmer More, should be mentioned. H. L. Mencken and many other of his contemporaries have practised the essay with distinction.

**Essay on Man**, AN. Moral poem by Alexander Pope. It takes the form of four epistles to Lord Bolingbroke, who is supposed to have suggested the theme, and was published anonymously in 1732-34. Though it has been objected that the author was hampered by the metaphysical nature of his subject, and gives no consistent scheme of beliefs, the Essay will always be remembered for the many terse sentences it has added to the great body of familiar quotations.

**Essays and Reviews.** Volume by seven writers, six of them clergymen of the Church of England. On its publication in 1860, its rationalistic tendencies aroused a storm of criticism. Two of the clergymen—Williams and Wilson—were suspended by the ecclesiastical courts, but the suspension was revised on appeal to the Privy Council, when, as it was said, Lord Chancellor Westbury "dismissed eternal punishment with costs." The contents of the volume were: *The Education of the World*, Frederick Temple; *Bunsen's Biblical Researches*, Rowland Williams; *On the Study of the Evidences of Christianity*, Baden-Powell; *The National Church*, H. B. Wilson; *The Mosaic Cosmogony*, C. W. Goodwin; *Tendencies of Religious Thought in England, 1688-1750*, Mark Pattison; and *The Interpretation of Scripture*, Benjamin Jowett.

**Essays of Elia.** Volume of familiar papers on various themes by Charles Lamb, published in volume form in 1823 after appearance in *The London Magazine*, and supplemented in 1833 by the *Last Essays of Elia*. These essays, varying from grave to gay, pervaded

with delightful fancy and rich in humour and tenderness, reveal much of the life and character of the author. They not only include the best of Lamb's work, but stand alone and unchallenged as the supreme collection of familiar essays in the English language. *Pron.* Ellia. See Lamb, Charles.

**Essen.** City of Germany. It lies 20 m. N.E. of Düsseldorf, and is the main centre of the Ruhr

Essen arms

industrial area. Seat of the original Krupp armament plants (demilitarised in 1946), of Germany's chiefmining companies, and of nearly 7,000 other industrial enterprises with, together, some 200,000 workers and employees, Essen's growth was phenomenal: from 57,000 in 1880 to 659,871 in 1939. During the Second Great War the city was almost destroyed by bombing. It was a principal rly. and canal shipping centre, and, around the old and the industrial towns, had developed spacious suburbs. Villa Hügel, the Krupp mansion, was famous; and there existed remarkable remnants of the old town, such as the minster church, built in 852 (which largely survived the bombing), and in the suburb of Werden a Benedictine church also of the 9th century.

Modern buildings of merit included the stock exchange, Folkwang museum, banking and business palaces, schools, etc., and model settlements and welfare institutions. Essen arose as a Benedictine nunnery in the 10th century, was first mentioned as a town in 1003, and, under a princess-abbess, was protected by the counts, later dukes, of Jülich-Cleves-Berg. Inherited by Brandenburg electors, it was secularised 1803, became Prussian in 1814, and the centre of French Ruhr occupation in 1923. Taken by troops of the U.S. 9th army, April 9, 1945, it was included in the British zone of occupation in Germany. See Krupp.

**Essen, HANS HENRIK, COUNT** (1755-1824). Swedish soldier and statesman. Born in West Gothland, Sept. 26, 1755, and educated at Uppsala, he entered the army. He became a favourite of Gustavus III, whom he accompanied in the war against Russia, 1788-90, and whose assassination he witnessed in 1792. In 1795 he was appointed governor of Stockholm. From 1800

to 1807 he was governor-general of Pomerania and distinguished himself by a stubborn defence of Stralsund against the French. In 1810 he negotiated a peace with France by which Pomerania was restored to Sweden and in 1811 was promoted field-marshal. In 1813 he commanded the successful expedition against Norway, and was governor there, 1814-16. He died at Uddewalla, June 28, 1824.

**Essence** (Lat. *esse*, to be). The sum of the permanent, constitutive qualities which make an existing thing what it is. The name quintessence (fifth essence) was given by Aristotle to ether, the other four being fire, water, earth, air. Essence is now used to denote the best and purest part of anything. As a theological term, essence or substance (*ousia*) is used of that which is common to the three Persons of the Trinity, in contrast

**Essenes.** Ancient Jewish sect. It sought to combine the ascetic practices of the Jewish religion with various Oriental tenets and rites. Probably an offshoot of the older sect of the Chasidim or Assideans, it would appear to have originated in the days of the Maccabees (2nd century B.C.). The Essenes believed in one God and in eternal predestination. While maintaining the immortality of the soul, they denied the resurrection of the body; and they held a Greek view of future rewards and punishments. Strongly opposed to an official priesthood, they refused to take part in the Temple sacrifices, but held ceremonial feasts with prayer in their own houses. They led very austere lives, some living in community under a kind of monastic rule, while others lived apart in contemplative solitude. Community

Essen. This important industrial city of Germany was severely damaged in the Second Great War by Allied bombing. Among factories put out of action were the Krupp works, of which a section is shown in this air view

with *hypostasis* (person), which refers to the special characteristics of each Person.

**Essence.** Strong flavouring used in puddings, cakes, and sweets. It is made by extracting or distilling the volatile oil from plants, seeds, or kernels, such as vanilla, coriander, musk, anise, nutmeg, peppermint, and coffee. Ratafia is prepared from bitter almonds and other kernels and orange peel. Essence of rennet is made from the stomach of the calf, and when poured into milk produces curds. Beef essence or extract is used in the making of gravies, and also as a stimulant for invalids. See Essential Oils.

of good was practised, and the time was divided between prayer, study of the sacred books, and agriculture.

Later, becoming tainted with the Gnostic tenets of the essential evil of matter and the dualistic origin of the universe, they abstained from flesh, wine, and marriage. They paid peculiar reverence to certain angels, and sometimes practised a form of sun worship. Strongly opposed by orthodox Jews, though favoured by the Herods, they were cruelly persecuted by the Romans. They had a settlement near the Dead Sea; Josephus estimated the stricter Essenes of his day at

about 4,000. The sect died out before the 3rd century. *Pron.* Es-seenz. See Jews.

**Essential Oils.** These oils, sometimes known as volatile oils, almost exclusively of vegetable origin, possess in concentrated form the odour of the plant parts from which they are derived. Oils in this group are readily obtained by distillation or other means from the flower petals, macerated leaves, grasses, stems, and fruit rind of members of the great botanical families Coniferae, Compositae, Labiatae, Lauraceae, and others. The most important and familiar oils in this group are those of peppermint, eucalyptus, cinnamon, clove, lavender, camphor, citronella, and turpentine. The main centres of production are the south of France, countries bordering the Mediterranean Sea, S.E. Europe, French African colonies, East Indies, India and Ceylon, and, for pine oils, Russia, the U.S.A., and Canada.

#### Sources of Important Oils

Different oils concentrate in different parts of plants, which thus serve as raw materials. From the rind of the fruits of various citrus plants, lime, lemon, bergamot, and orange, oils are obtained; from berries are derived juniper and pimento oils; from flowers, lavender oil. Ripe seeds of species of culinary herbs are the source of the food flavouring oils of celery, caraway, marjoram, sage, thyme, fennel, and anise. The needles and cones of various conifers—firs, pines, larches, and spruce—yield pine-needle oils. Eucalyptus oils are derived from the leaves and terminal branches of the many species known to Australians as blue gums, which comprise in their 300 species 75 p.c. of the vegetation of Australia. Orris and ginger are produced from rhizomes; clove oil from immature flower buds; angelica and vetivert oils from roots; the whole dried plant is used for peppermint oil; of the camphor tree every part is utilised in making camphor and camphor oil.

Essential oils and other naturally occurring perfumery raw materials are now obtained from crops so widely scattered over the world that new crops become available every month of the year. Thus in March the violet, clove, and Bourbon geranium are available; in Sept., aniseed, jasmine, Ceylon citronella, English lavender, English and American peppermint, spearmint, French geranium.

Chemically, essential oils consist largely of hydro-aromatic

hydrocarbons, known as terpenes, and are of the empirical composition  $C_{10}H_{16}$ ; associated with these terpenes are their many alcoholic, aldehydic, ketonic, and ester derivatives, and it is to these secondary constituents that an oil frequently owes its aroma. Practically all essential oils are liquids, of boiling point around 160°–180° C., generally insoluble in water but freely soluble in alcohol, ether, and other common organic solvents, and in fats and fatty oils.

Some essential oils are obtained by solvent extraction of the raw material, but the commonest method is to make use of the property of volatility in steam common to all. Dry, chopped up, or macerated raw material—grasses, berries, leaves, bark, etc.—is placed in stills and steam passed through the mass. The still may hold tons of material; reduced pressure may be resorted to, and the steam which passes through is condensed and subsequently the oil separated from the resultant water mixture. The oil yield varies from less than 1 p.c. of the raw materials treated for pine-needles and many grasses, to 17 p.c. for bay leaves.

#### Methods of Extraction

Oils of the citrus group are best obtained by expression, usually in small hand-operated presses, from the fruit rind. West Indian lime oil, however, is generally distilled from the rind of the fruit. For jasmine, orange flowers, tuberose, and some other flower oils, enfleurage is preferred in the south of France: here the flower essence is absorbed by a thin coating of fat on which the flowers are placed. American, French, and Russian pine oils are obtained as an exudation from the bark of the tree, such oils on distillation yielding turpentine and a solid residue of colophony or rosin, the last being used in the soap, varnish, and paper-making industries.

However obtained, many of these oils, notably the floral ones, are used in general perfumery purposes, soap, and cosmetics. Eucalyptus and juniper have medicinal and pharmaceutical applications. Anise and caraway are used in cordials and liqueurs, while lemon, lime, orange, peppermint, and anise find application in flavouring. Some essential oils have germicidal properties, e.g. oil of thyme, eucalyptus, and pine-needle oils, the latter often in antiseptic sprays and inhalants. Some species of eucalyptus and

pine oils help in the modern froth-floatation method of treating mineral ores.

#### Uses of Essential Oils

A word must be said about essential oils as the raw materials for the manufacture of chemical substances important in the perfumery and flavouring industries. Safrol, present in oil of camphor and notably in oil of sassafras, can be converted by a series of operations into heliotropin, a white crystalline substance with an odour of the heliotrope flower. Citral, present to the extent of 75 p.c. and upwards in lemongrass oil, and also in small amounts in oil of lemon, can be converted into a class of substances known as ionones, which when diluted have the odour of violets and impart freshness, delicacy, and volatility to perfumes. From some pine oils can be obtained the terpene hydrocarbon pinene, which, by a series of chemical operations is converted into synthetic camphor. Turpentine, a thinner in the paint industry, can be converted into terpineol, a substance used in almost every compounded perfume and valued because of its stability and its pronounced lilac odour. Terpinolene, also derived as a by-product from turpentine, is used to make disinfectants, especially those of the spray type. Clove oil contains upwards of 85 p.c. of eugenol, to which the oil owes its odour. Large amounts of eugenol extracted from clove oil are converted into the crystalline flavouring material vanillin, which formerly could be obtained only from vanilla beans. The principal essential oils, and plant sources from which they are derived are the subjects of specific articles. See Fixed Oils; consult also The Essential Oils, H. Finckemore, 1926; The Volatile Oils, E. Gildemeister, 1926.

H. M. Langton, B.Sc., F.R.I.C.

**Essential Work Orders.** The regulations issued by the minister of Labour on March 7, 1941, to prevent loss of production, through unnecessary changes of job by workers in certain undertakings scheduled as being engaged on work essential to the prosecution of the Second Great War. In a scheduled undertaking the management's right to dismiss employees, and employees' right to leave their employment, became subject to the written permission of a national service officer. Employees could be discharged only for serious misconduct, and any

employees absenting themselves without leave or reasonable excuse, or being persistently late, could be reported to an officer. At first these orders applied chiefly to industries directly engaged in making munitions, but later amendments extended control to all industries, and workers could be directed to specific industries. The orders were gradually relaxed after the war, and by 1950 the last (applying to agriculture and coal-mining) were abolished.

**Essequibo.** Settlement and river of British Guiana, S. America. The settlement extends to the Venezuelan frontier and borders on the Atlantic Ocean for 120 m. It contains locust trees, iron wood, ebony, greenheart, and other hardwood trees. It was the subject of rival claims, settled by the arbitration treaty of Feb. 2, 1897, between Great Britain and Venezuela.

The river rises near the equator, among the mountains on the Brazilian border, and flows N., entering the Atlantic near Georgetown through a long estuary, from 15 m. to 20 m. wide, containing several islands. Its length is about 600 m., only 40 m. being navigable to vessels of deep draught, owing to cataracts; its mouth is impeded by sand bars. The largest river of the colony, it receives important tributaries, e.g. the Rupununi, Masaruni, Cuyuni, and the Pólaro.

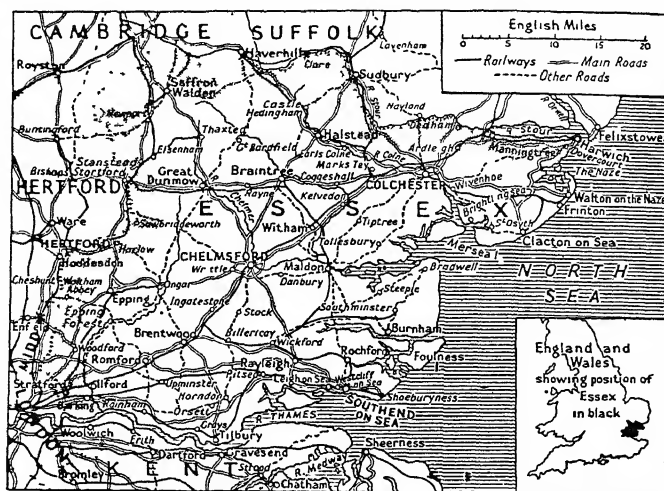

**Essex.** Agricultural and maritime county of S.E. England. It is bounded S. by the Thames, E. and S.E. by the North Sea, N. by Suffolk and Cambridgeshire, and W. by Hertfordshire and Middlesex. Its area is 1,530½ sq. m. Some 90 m. of seaboard, indented by

Essex arms

several estuaries, is marked by low-lying islands: Canvey, Foulness, Wallasea, Mersea, etc. The chief rivers are the Thames, Lea, Stour, Colne, Chelmer, Blackwater, Crouch, and Roding. While the coastal region is flat and marshy, there is comparatively high ground in the N.W. and centre, the highest points being reached at High Beech, Epping Forest (q.v.); Danbury, between Chelmsford and Maldon; and in the Langdon Hills.

The forest of Essex, known after the early part of the 14th century as the forest of Waltham, has dwindled to the present day Epping Forest, a public possession since 1882. Chelmsford is the co. town and seat of a bishop; Col-

Essex. Map of this deeply indented county, showing its relation to the London area

chester, Maldon, Saffron Walden, Romford, and Braintree are other towns, with Barking, Dagenham, Ilford, East and West Ham, in the London area. Harwich is the chief port. Southend-on-Sea, Clacton-on-Sea, Frinton-on-Sea, Walton-on-the-Naze, and Dovercourt are popular holiday resorts. Eight members are returned to parliament for the county, and 16 for individual boroughs.

The county, described by Norden in 1594 as "fatte, fruteful, and full of profitable things," produces wheat, barley, and fruit. Apart from brewing (Romford) and engineering (Colchester), the manufacturing industries are largely confined to the metropolitan area, in which is the bulk of the population. The Crouch, Blackwater, and Colne have oyster beds; the Colchester oyster feast, an annual event (Oct. 20), dates from early times. There is a gunpowder factory at Waltham Abbey, and the Tilbury Docks and Victoria Docks (Plaistow) are on the Thames. Yachts and pleasure boats are built at Burnham-on-Crouch, a popular yachting centre.

In the 1st century B.C. Essex was the home of the British tribe of the Trinobantes. Later the kingdom of the East Saxons, it became the scene of many conflicts between Saxons and Danes. William of Normandy laid a heavy hand upon it. In the 12th century it gave its name to an earldom created by Stephen in favour of Geoffrey de Mandeville. From the 7th until the middle of the 19th century it was ecclesiastically attached to the see of London. It was next linked first to

Rochester and then to St. Albans. In 1914 the see of Chelmsford was founded. There are bishops suffragan of Colchester and Barking.

The county is rich in prehistoric, Roman, Anglo-Saxon, medieval, and monastic remains. It has many notable churches and some fine old houses, Audley End among them, while the remains of Norman castles, e.g. Colchester and Hedingham, and the fragment at Hadleigh, bear witness to the Norman occupation. The timberwork and thatching are notable. Essex is generally the driest county of England. An earthquake on April 23, 1884, damaged 1,200 houses between Colchester and the Blackwater. Pop. 1,755,459.

**LITERARY ASSOCIATIONS.** In Chigwell is the gabled King's Head Inn described as The Maypole in Dickens's *Barnaby Rudge*. The Rose Inn at Peldon and the marshes figure in Baring-Gould's *Mehalah*. Miss Braddon laid the scene of Lady Audley's Secret at Ingatstone. John Locke, philosopher, spent ten years and was buried at High Laver. John Ray, botanist, was born and died at Black Notley; Thomas Tusser, author of *Five Hundred Points of Good Husbandry*, 1573, was born at Rivenhall; Sydney Smith at Woodford, Isaac Taylor at Ongar; Francis Quarles near Romford. Dr. William Harvey was buried at Hempstead near Saffron Walden. More recently S. L. Bensusan wrote a series of tales and short stories about the marshlands. H. G. Wells lived for some years at Easton and described it as *Matchings Easy* in *Mr. Britling Sees It Through*; while

Arnold Bennett, residing at Thorpe-Soken, introduced Frinton in Mr. Prohack. The Victoria History of the co. was completed in 1907.

**Essex, EARL OF.** English title now held by the family of Capell. There were earls of Essex soon after

Walter Devereux,  
1st Earl of Essex  
From a portrait in  
the collection of  
Baron Bagot

the Norman Conquest, including Geoffrey de Mandeville (d. 1144). His sons followed him, after which the earldom came to the Bohuns. This family became extinct in 1373, when the title passed to

Thomas of Woodstock, duke of Gloucester, who had married one of the heiresses of the Bohuns. Henry Bourchier, a grandson of Gloucester, was the next earl, but his family died out in 1540. Thomas Cromwell was earl of Essex in 1540, and William Parr, marquess of Northampton, in 1543, but in both cases the title died with the holder.

The family of Devereux was related to the Bourchiers, and probably for this reason Walter Devereux (1541-76) was made earl of Essex in 1572. He married a daughter of Sir Francis Knollys, and spent three years in unsuccessful efforts to colonise Ulster, whither he went with a small army in 1573. He was succeeded by his son, the favourite of Queen Elizabeth, and with the death of the latter's son Robert, in 1646, the title became extinct.

In 1661 Arthur Capell was made earl of Essex. He was succeeded in 1683 by his son Algernon, and the title is still held by his descendants. In 1916 Algernon (b. 1884) became the 8th earl. The eldest son is known as Viscount Malden.

**Essex, ROBERT DEVEREUX, 2ND EARL OF (1566-1601).** English soldier and courtier. Eldest son of

Robert Devereux,  
2nd Earl of Essex  
After Hilliard

the 1st earl, he was born at Netherwood, Herefordshire, Nov. 19, 1566, educated at Trinity College, Cambridge, succeeded his father in 1576, and was general of horse under his stepfather Leicester in the Netherlands, 1585-86, being knighted for gallantry at Zutphen.

He continued Leicester's court feud with the party in which the Cecils and Raleigh were prominent, but became a favourite of the queen, though his lack of self-control led to quarrels, and his marriage with the widow of Sir Philip Sidney especially angered her.

Essex took part in Drake's expedition to Portugal, 1589, commanded an expedition to Normandy, 1591, secured the conviction of Roderigo Lopez for conspiracy against the queen's life, 1594, distinguished himself at the capture of Cadiz, 1596, lost favour by the failure of the Islands, or Cadiz Voyage, 1597, but was master of ordnance, earl marshal, informal foreign secretary to the queen, and chancellor of Cambridge. In 1599 he was appointed governor-general of Ireland, and, returning without leave from his attempt to suppress the rebellion of O'Neil, earl of Tyrone, with whom he was accused of making a dishonourable treaty, he was dismissed from office and imprisoned from Oct., 1599, to Aug., 1600.

Thwarted in his efforts to regain influence at court, and broken in health, he was implicated with Southampton and others in an attempt to secure the dismissal of the queen's advisers. He attempted a rising in London, was arraigned, and beheaded Feb. 25, 1601. Bacon, whom he had befriended, appeared against him on his return from Ireland, and with Raleigh was largely responsible for carrying out the death sentence, to which Elizabeth reluctantly consented. The story that the queen gave Essex a ring, the return of which would have ensured his pardon, is generally discredited, though what was described as the identical ring was sold at Christie's, May 19, 1911, for £3,412. Essex was fearless but headstrong, generous, a popular favourite, but utterly lacking in statesmanship. He was a writer of sonnets and masques.

**Bibliography.** Lives and Letters of the Devereux, Earls of Essex, W. B. Devereux, 1853; Bacon and Essex, E. A. Abbott, 1877; Elizabeth and Essex, G. L. Strachey, 1928; Life and Death, G. B. Harrison, 1937; The Unhappy Favourite, J. Banks, 1939.

**Essex, ROBERT DEVEREUX, 3RD EARL OF (1591-1646).** English soldier. Son of the favourite of Queen Elizabeth, he was restored in 1604 to the title his father had lost, James I being then on the throne. He was chosen as one of the companions of Henry, prince of Wales. In 1620 Essex went with a force

to recover the Palatinate for the elector Frederick, and in 1625 with the fleet that sailed to capture Cadiz.

In 1639 he held a command in the army sent by Charles I against rebel Scots in the first Bishops' War, after which there was an estrangement between him and the king. On the outbreak of the Civil War Essex took the side of the parliamentarians, and was appointed general of their forces. The earl led the army at Edgehill, relieved Gloucester, and fought the first battle of Newbury. He proved his incapacity when, after leading his army into Cornwall, he left it to surrender at Lostwithiel, himself escaping by boat. He resigned when the self-denying ordinance was passed in 1645, and died Sept. 14, 1646.

**Essexite.** Crystalline igneous rock named after Essex co., Mass., U.S.A. Akin to gabbro, which it resembles, but richer in soda and potash than the normal types, it contains purple or green varieties of augite, lime feldspar (labradorite), potash feldspar, and a little analcite or nepheline. Soda-hornblende, olivine, or biotite may also be present.

**Essex Regiment.** Regiment of the British army. Formerly the 44th Foot raised in 1741, it was

Essex Regiment  
badge

given the title of the East Essex Regiment in 1782. In 1881 the unit was amalgamated with the 56th Foot and received its present title. The regi-

ment took part in the siege of Gibraltar (1779-83), gaining the Castle and Key and the word Gibraltar on its colours. It fought in the West Indies and the American War of Independence, and served with Wellington throughout the Peninsular War. The Essex were at Waterloo, and served in the China War, the Crimea, the Indian Mutiny, the Nile Campaign (1884-85) and the South African War. They raised 31 battalions for service in the First Great War, earning the battle honours Le Cateau; Marne, 1914; Loos; Somme, 1916; '18; Arras, 1917, '18; Cambrai, 1917, '18; Selle; Gallipoli, 1915, '16;

Robert Devereux,  
3rd Earl of Essex  
After Walker

and Gaza. During the Second Great War, the Essex fought in the battle of France (1940), with the 8th army in Africa and Italy, and took part in the invasion of the Continent and the subsequent campaign in France and Germany. The regimental depot is at Warley.

**Es Sinn, ATTACK ON.** British operations, Jan.-May, 1916. After his retreat from Ctesiphon, Mesopotamia (now Iraq), General Townshend was closely invested by the Turks at Kut-el-Amara, Dec. 3, 1915, and a relief force was organized under General Aylmer. To reach Kut the Indo-British forces had to storm several positions on the Tigris. The British base camp was Imam Ali Gherbi; and the final objective was the strong entrenched position of Es Sinn, 7 m. E. of Kut. Delayed by adverse weather, Aylmer was unable to make any considerable movement until March 8, when he attempted a flanking movement by attacking the Dujailar redoubt at the S. end of the Es Sinn position. On April 4 the Hannah position was carried, by which time the Felahieh position had been won.

Townshend was in serious need of food and supplies, and great efforts were made by the relieving force. On April 17 the British achieved a small success at Beit Aiessa, but the Es Sinn positions could be neither turned nor carried. On April 24 a desperate effort was made to break the blockade of Kut, and get supplies to Townshend. The steamer Julnar reached Magasis, behind Es Sinn, where it was captured by the Turks. Townshend surrendered on April 25, but the Turks failed to follow up their success, and the situation developed into a stalemate until autumn. Consult My Campaign in Mesopotamia, C. Townshend, 1920.

**Esslingen.** Town of Germany, in Württemberg. It stands on the Neckar, 7 m. E.S.E. of Stuttgart. Its chief interest is historical. The old town, around which are the modern suburbs, is still girt with its walls and towers, while above is the ruined castle. The public buildings include the church of S. Dionysius, dating in part from the 11th century; the 14th century church of Our Lady, a Gothic building restored in the 19th century, and containing some beautiful stained glass and a fine tower; the 13th century Gothic church of S. Paul; a hospital, and several schools. There are two town halls: the older one, dating from 1430, is now a school, and has a wonderful clock; the newer one was formerly

a palace. The industries include large engineering works, railway shops, electrical, textile, leather, toy, and furniture factories and a trade in wine. Esslingen, a town since 886, was a free city from 1209 until 1803, when it was taken into Württemberg. Pop. 43,089.

**Est, CANAL DEL'.** Canal of N.E. France. It extends from the Meuse, near Givet in Ardennes, to Portesur-Saône in Haute-Saône, and has connexion with the Marne and Rhône Canal at Void. Portions of the Meuse and Moselle are included in the canal system, which has a length of 286 m.

**Estaires.** Town of France, in the dept. of Nord. It is on the river Lys, 13 m. W. of Lille, and was prominent in the First Great War. The Allies occupied it early in Oct., 1914, and in the German offensive against the Channel ports of April, 1918, it was the scene of spirited fighting. At the Estaires drawbridge the British held the enemy until the great steel and concrete structure was blown up. Occupied by the Germans, April 11, it was recovered by the Allies early in Sept. See Ypres, Battles of.

**Estate.** Originally a condition, or rank, the idea expressed by the modern word state. It is chiefly used, however, for landed and other property, and all property is by English law classed as either real estate or personal estate. By the word alone is meant landed property, generally a considerable amount under a single ownership and all contiguous. An estate may be of various kinds, freehold, leasehold, or (until 1926) copyhold. See Land Laws; Real Property.

**Estate Agent.** One who acts for another in the management or sale of landed or house property. He lets and collects the rents of estates, farms, houses, cottages, etc., and generally represents the landlord in dealing with tenants. He should have a knowledge of agriculture, bookkeeping, surveying, valuing, forestry, drainage, building construction and repair, and the laws concerning the relations of landlord and tenant.

**Estate Duties.** Name given in the United Kingdom to the duties paid on the estates of deceased persons. They date from 1894,

before which time there were death duties of various kinds, including legacy, probate, and succession

Esslingen. His one town of Württemberg. Gothic church of Our Lady, left, and the Town church, right

duties. In 1894 two new principles were introduced. Real property, hitherto exempt from charges of this kind, was made to pay at the same rate as personal property, and the duties were levied on a graduated scale. This scale varied from 1 p.c. on estates between £100 and £500 to 8 p.c. on estates over £1,000,000. From 1894 until 1946 the rates rose rapidly. The Finance Act, 1946, while increasing still further the rate on estates over £12,500, followed a new policy by exempting all estates not over £2,000 and reducing the rates on estates up to £12,500. The Finance Act, 1949, which abolished legacy and succession duty, left the rates of estate duty unchanged on estates under £17,500, but increased the rates on estates over that amount up to 80 per cent on estates over £1,000,000.

**Estates.** Word used for "an organized collection, made by representation or otherwise, of the several orders, states, or conditions of men who are recognized as possessing political power." Its interest is now solely historical, although we still speak of the estates of the realm. In France, Germany, and some other European countries the same idea is translated by the word states, and so we have the states-general of France and the Dutch Republic.

The idea of estates began about the 13th century with the growth of the representative system, and they are found in Spain and France, as well as in England and Scotland. In France the various provinces, e.g. Brittany and Langue-doc, had their local estates, and in Spain the various kingdoms had theirs. The German countries had also their estates who met in a landtag or diet. It is usual to assume

the number of estates as three, but this is purely accidental. In Sweden and Aragon there were four estates. In England the merchants and lawyers might easily have formed a separate estate, but they did not, and so we have the three estates of lords spiritual, lords temporal, and commons, sitting, however, in two houses. In Scotland the lesser barons formed a separate estate, not sitting, as they did in England, with the representatives of the towns. The sovereign is sometimes referred to as an estate of the realm, and the press is known, a tribute to its power, as the fourth estate, a phrase said to be due to Burke. *See* Diet; Landtag; Parliament; Representation.

**Estcourt.** Town and district of Natal. The town stands at an elevation of 3,830 ft., on the rly. from Pietermaritzburg to Ladysmith, 76 m. N.W. of the former. It was the scene of important operations during the S. African War. At Weenen, 28 m. N.E., parties of Boers were massacred by Zulus in 1838. Pop. dist., 58,483.

**Este** (anc. *Ateste*). A city of Italy, in the prov. of Padua. It stands on the slopes of the Euganean Hills, 20 m. by rly. S.W. of Padua. It is enclosed by medieval walls, has a ruined castle, a cathedral, and two other churches, one with a leaning bell-tower. The National Museum is rich in prehistoric, lacustrine, and sepulchral relics, besides Greco-Roman antiquities. The manufactures include pottery, ropes, and iron goods. A Roman town, it became the seat of the Este family in the 10th century, and in 1405 it surrendered to Venice. Pop. 11,704.

**Este.** Name of a noble Italian family founded by Oberto II (c. 1015), margrave of Casalmaggiore. His grandson, Azzo II, became duke of Milan, and his sons, Guelph and Fulco, founded the German and Italian branches of the family respectively. From the former the Hanoverian sovereigns of Great Britain are descended.

From the latter came the Italian family which held the lordships of Ferrara, Modena, and Reggio, the emperor Frederick III making Barco d'Este (d. 1471) duke of Modena and Reggio in 1452, and Pope Paul II creating him duke of Ferrara in 1471. His brother, Ercole I (1431-1505), was father of Beatrice

(1475-97), duchess of Milan, one of the most beautiful women of the Italian renaissance.

Alfonso I (1486-1534), who married Lucrezia Borgia as his second wife, he being her third husband, was a statesman and a soldier. His son, Cardinal Ippolito (1509-72), built the magnificent Villa d'Este at Tivoli (the whole upper storey of which, on one side of the courtyard, was demolished by a bomb dropped from an Allied aeroplane in 1944). Alfonso II (1533-97) kept a luxurious court, where he detained the poet Tasso, who was in love with his sister Eleanora. Alfonso IV (1634-62) was father of Maria Beatrice, queen of James II of England. The Italian branch of the family ended with Ercole III (1727-1803), who was dispossessed of the duchy of Modena by the treaty of Campoformio in 1797, and whose only daughter, Maria Beatrice, married

Este. The Villa d'Este at Tivoli, near Rome, built by Cardinal Ippolito d'Este in 1549

Archduke Ferdinand, third son of Francis I of Austria. His son Francis IV (1779-1846) was made duke of Modena by the congress of Vienna in 1814, but his son Francis V (1819-75) was dispossessed by the incorporation of the duchy in the kingdom of Italy in 1859. *See* Modena. *Pron.* Es-ty.

**Ester.** Substance formed by the union of alcohols and acids with the elimination of water. Gmelin first used the term ester to distinguish this class of compounds from simple and mixed "ethers." An ether is an oxide of the alcohol radical analogous to metallic oxides, whereas in esters both an alcohol radical and an acid radical are present. Esters are prepared (1) by the direct action of an acid upon an alcohol; (2) by the action of an acid chloride or the anhydride of an acid upon an alcohol; or (3) by treating the salt of an acid with an alkyl halide, *e.g.* methyl acetate may be prepared by treating silver acetate with methyl iodide. The esters are usually

neutral and colourless substances with a fragrant smell. Many occur in plants, forming the constituent to which the scent is due. They are sometimes manufactured as substitutes for natural perfumes and flavours.

**Esterhazy,** MARIE CHARLES FERDINAND WAIZIN, COUNT (1847-1923). French soldier. He served in the regiment of Papal Zouaves, became a major in the French army, and accused Captain Dreyfus of writing the famous *bordereau*, or document, containing military secrets, said to have been communicated to the German military authorities. The opinion grew that Esterhazy had himself forged the *bordereau* in an imitation of Dreyfus's handwriting, and that he had supplied information to Germany. He was compelled to leave France when the truth became known, and later confessed the forgery. He died in England. *See* Dreyfus Case.

**Esterhazy de Galantha.** Family of Hungarian noblemen. Dating back to the early 13th century, in the 17th they became princes of the German empire. They were prominent supporters of the house of Hapsburg and have included several notable men. Among these were Paul IV (1635-1713), a leading general in the wars against the Turks; Nikolaus Joseph (1714-90), general, diplomatist, and a patron of art, literature, and music; and Nikolaus IV (1765-1833), founder of a famous collection of pictures at Vienna, who declined Napoleon's offer of the crown of Hungary and supported the national Hungarian movement.

**Estevan.** Town in the extreme S. of Saskatchewan, Canada. On the Souris river, it is 145 m. S.E. of Moosejaw by C.N.R. and C.P.R. The centre of a farming and coal-mining district, it has grain elevators, a creamery, a flour mill and a government plant for coal briquettes. Pop. 2,774.

**Esther,** BOOK OF. O.T. book so named after the chief character in the story. When Vashti, the consort of the Persian king Ahashverôsh (Xerxes), was deposed, Esther, the adopted daughter of Mordecai, a Jewish exile, was chosen in her place. She was thus enabled to frustrate the plots of

Count Esterhazy, French soldier

Haman (*q.v.*), a powerful enemy of her people. Haman had cast lots (*purim*) to destroy the Jews, and the real purpose of the book seems to be to explain the origin of the Jewish festival Purim (called in 2 Maccabees, 15, v. 36, the Day of Mordecai). The book of Esther would seem to have been written between 300 B.C. and the Christian era.

**Estimate.** Statement in which is given the anticipated cost or price of specified work. The statement is prepared by the contractor who offers to carry out the work, and submitted for consideration to the person for whom the work is to be undertaken. Estimates are frequently given by builders, painters, or contractors for projected repairs on a relatively small scale. They do not form a legal contract, although in practice the price charged when the work is completed is usually that stated in the estimate. For more extensive operations, tenders setting out the work in detail, and often specifying the quality of materials to be used, are prepared; the tender accepted is usually embodied in a legal contract.

Estimates of national expenditure are submitted annually before the end of March by various government depts. for consideration by parliament. They give the anticipated expenditure of the depts. during the financial year beginning April. Civil depts. submit their estimates through the Treasury, by which they are carefully considered and often adjusted before reaching parliament; but defence depts. submit their estimates without the intervention of the Treasury. Parliamentary control over national expenditure is thus safeguarded and the presentation before the budget speech early in April affords an opportunity for amendment, if necessary, before the inclusion of the estimates in the budget itself.

Civil expenditure is set out under the following headings: central government and finance, foreign and imperial services; justice, police, and prisons; education; health, labour, and insurance, trade and industry, including agriculture and fisheries, roads, and civil aviation; common services, which covers the expenses of the ministry of Works; war pensions; block grants to local authorities; and the expenditure of the ministries of Supply, Food, Transport, etc. Separate headings

show the cost of administering the inland revenue and customs and excise depts. and the post office.

**Estoile** (old Fr., star). In heraldry, a star, usually represented as having wavy rays. If there are six rays or more, only the alternate rays are wavy. An estoile with a number of long rays springing from it at an angle, or with a long tail, is called a comet. See Mullet.

**Eston.** Urban district of the North Riding of Yorkshire, England. It is 5 m. E. of Middlesbrough by railway. It has ironstone mines, steel works of Dorman, Long, and Co. Ltd., a shipyard, large commercial docks, and contains part of a chemical works belonging to I.C.I. Ltd. Pop. 31,142. The Eston breakwater projects from the E. bank of the Tees estuary.

**Estonia.** Republic of the Soviet Union since 1940. It is bounded N. by the Gulf of Finland, E. by the Leningrad region of

industry. Dairy farming prospers and butter is the leading export. Oil-shale of high quality is plentiful. Manufactures include iron, steel, machinery, cement, cotton, paper, wood pulp, and spirits. Estonia carries on a large transit trade, the seaport of which is Tallinn, the capital, connected by railway with Leningrad. Other towns are Narva and Tartu (*q.v.*). Arensburg and Haapsalu are famed for their curative mud baths.

In religion the Estonians are Lutherans, except about 15 p.c. who belong to the Greek Orthodox Church. The standard of education is high, with few illiterates. Secondary education is provided by numerous grammar schools and lyceums. Tartu (Dorpat) university, established by Gustavus Adolphus in 1632, was reopened in 1919 as an Estonian university. Its technical faculty was made an independent university at Tallinn in 1936. Estonia is rich in folklore, the

Estonia. Map of the Baltic state which in 1940 became the 16th Soviet republic

R.S.F.S.R., S. by Latvia and Gulf of Riga, and W. by the Baltic. Its area is 18,353 sq. m. and in 1940 its estimated pop. was 1,120,000. Except in the S.E., which is hilly, the mainland lies low, it is intersected by rivers and streams, and much of it is swampy. There are many lakes, and about half of Lake Peipus lies within it. About 21 p.c. is forest. The climate is warm in summer and cold in winter. Huu (Dago), Saare (Oesel), and other islands belong to Estonia.

Agriculture, which is the chief occupation, is conducted scientifically, with the result that good crops, particularly flax, are raised from a naturally poor soil, and there is a flourishing livestock

chief records of which are *Monumenta Estoniae Antiquae*, and the MS. collection of Jacob Hurt, containing songs, tales, proverbs, and other folklore items. After F. R. Kreutzwald published the national epic *Kalevipoeg* in 1861, a new Estonian literature developed in the 19th century, the best-known writers being Otto Masing, Lydia Koldula, Mihkel Weski, and Johan Liiv.

**HISTORY.** The early history of the country is obscure, but early in the 13th century it was conquered by Danes and Germans. The Danes founded Reval (Tallinn) in 1219, and later divided the land between themselves and the Germans, finally selling their

part of it in 1346 to the Teutonic Knights who joined it up with Livonia. After the dissolution of the Teutonic Order in 1560, N. Estonia passed to Sweden. S. Estonia remained under Poland till 1629, when the whole of Estonia became a Swedish province with Livonia, which was ceded to Russia in 1721. German influence was always strong owing to the presence of the Baltic Barons, the descendants of the Teutonic Knights, and of numerous German settlers (Balts), who called the country *Estland* or *Esthland* and its natives the *Ests*. Only after the Russian revolution and the Estonian war of liberation was this dominant German influence crushed.

By decree of the Russian provisional government on April 12, 1917, the prov. of Estonia was united with the N. part of the prov. of Livonia and formed into a new autonomous prov. under a national council or diet. This council was elected by universal suffrage. After the seizure of the supreme power in Russia by Lenin, Estonia, like Finland, decided to become independent. She was about to hold a constituent assembly when the Bolsheviks intervened, and summarily dissolved the national council. During the Brest-Litovsk negotiations, the Germans, to compel Lenin to come to terms, took Tallinn, Feb. 25, 1918, and, marching through Estonia and Livonia, captured Dvinsk and Pskov.

#### After the Brest-Litovsk Treaty

By the Brest-Litovsk treaty the Bolsheviks undertook to evacuate those territories, which were to be policed by the Germans until the state organization of both provinces was restored. As this would have virtually meant the complete Germanisation of these regions, the people, 90 p.c. of whom were pure Estonians, made emphatic protests to the Allies, and Great Britain, France, and Italy recognized their national council. But the Germans remained masters of the country, and it was not till Nov. 11 that the Estonians recovered power. Next the Bolsheviks began an invasion which carried them to within 15 m. of Tallinn. Finland came to the aid of Estonia with 5,000 rifles, and on Dec. 12 a British fleet entered the capital in support with arms and munitions. Meanwhile Estonia had organized her army under a former Russian staff officer, and by Feb. 24, 1919, her soil was free of the invaders.

Longing for peace, the new state accepted proposals for a conference made by the Soviet government. This took place at Pskov on Sept. 19, but the Estonian delegates made it a condition that Bolshevik peace proposals were to be submitted to all the Baltic states together, to which the Soviet representatives agreed. After difficult and interrupted negotiations, peace was finally made Feb. 2, 1920, the independence of Estonia being recognized by the Soviet government.

#### Russia's Demand for Bases

In the autumn of 1939 Russia made demands on Estonia for naval and air bases, and on Sept. 25 the two states signed a mutual assistance pact. Russian aeroplanes, warships, and troops occupied strategic points on Oesel and Dagó and in the town of Baltiski. In June, 1940, Russia demanded a change of government and free passage for Soviet troops; and in Aug. Estonia became the 16th Soviet republic.

When Germany attacked Russia in June, 1941, one thrust was made through Lithuania, Latvia, and Estonia to Leningrad. German forces advanced on both sides of Lake Peipus to cut off the Russians in Estonia and directly threaten Leningrad. Tallinn was evacuated at the end of August, leaving Estonia, apart from Oesel, in German occupation. In 1944 Russian armies began to exert heavy pressure against the Germans in Estonia, reaching Lake Peipus and the Narva river early in Feb. Tallinn was liberated on Sept. 22 and Pernaú the following day. By Sept. 29, Estonia had been freed from the invaders, except the islands of Dagó, freed Oct. 3, and Oesel, cleared of the enemy Nov. 24. *Consult* Estonia, J. A. Jackson, 1941.

**Estoppel** (old Fr. *estoper*, late Lat. *stuppeare*, to stuff with tow, *stuppa*). Doctrine of English law. Broadly, it means that in certain circumstances a party will not be allowed to show the truth in his own favour, when he has, by some act or deed or negligence, led the other party to believe that something else is the truth. Estoppel is (1) by deed; (2) *in pais*, or by act; (3) by negligence. (1) If A makes a deed of conveyance of Whiteacre to B on March 1, reciting in it that he (A) is the owner, and in fact he is not, but on some subsequent day he becomes the owner, the estate at once passes to B, because A will not be allowed to come and say that on March 1 he had no right to con-

vay. Generally speaking, every statement made by a man in a deed estops him from denying the truth of it. (2) If A does an act or makes a statement which causes B to alter his position, A is not allowed afterwards to aver against B anything to contradict the act or statement. Thus, if A takes lease of a house from B, he cannot afterwards say that B is not the owner thereof and refuse to pay his rent. (3) If A by his negligence causes B to alter his position, he is not allowed to dispute the correctness of B's action so as to take advantage of his own negligence.

**Estournelles de Constant**, PAUL HENRI BENJAMIN, BARON D' (1852-1924). French politician. He was born at La Flèche, Sarthe, Nov. 22, 1852. Councillor of the French embassy in London, 1890-95, then deputy for Sarthe until 1904, he represented France at The Hague peace conferences of 1899 and 1907. A member of the international court of arbitration, 1909, he received the Nobel peace prize the same year. After the First Great War he was appointed director-general of the French museums and art galleries, and strove for a Franco-German democratic rapprochement. He published a number of books on European and general peace problems. He died at Bordeaux, May 15, 1924.

**Estovers** or **BOTES**. Certain furnishings of wood that a tenant is allowed to cut and use for the purpose of his holding. They include *firebote*, or wood for firing, *ploughbote*, to mend his plough; *housebote*, to repair his house; and *hedgebote*, to maintain his fences. Estovers are usually, if not always, enforceable by the custom of a manor, and are rights indefeasibly attached to the lands that form part of that manor; that is to say, they are not personal rights, but must be claimed in the character of holder of the lands. Estovers is old Fr., necessities; *bote* is mid. Eng., advantage. *See* Lopping.

**Estray** (old Fr. *estramer*, to stray, wander from the street, Lat. *strata*). Term used in law for a strayed animal. An ancient law of England says that if valuable tame animals are found wandering at large they are to belong to the sovereign. But in most cases the sovereign long ago granted the right in them to the lord of the manor where they might be found. They must be "proclaimed" in the nearest church and two market towns, and, if not claimed in a year and a day, are irredeemably lost to the owner. *See* Pound.

**Estreat** (old Fr. *estrait*, extract). Term used in English law, meaning to forfeit something, generally a sum of money, by way of enforcing an obligation to the crown. It usually occurs in the case of recognizances, where a person has agreed to do or not to do something in face of a court under penalty of paying so much if he does not fulfil the obligation. Thus, A. B. will enter into a recognizance to keep the peace for six months under penalty of £50. If he breaks the peace within that time his recognizance may be estreated, and the like happens if X. Y. goes bail in £50 that A. B. should appear and stand his trial. The bail will be estreated if A. B. does not duly appear. Estreat is enforced by levying a distress upon the property of the person liable. The original meaning of the word is a copy or extract of an original record or document.

**Estrées**, GABRIELLE D' (1573-99). Mistress of Henry IV of France. Daughter of Marquis Antoine d'Estrées, she met Henry at Coeuvres in 1590. Impressed by her beauty, the king caused her to be divorced from her husband, Nicholas d'Amerval, Sieur de Liancourt, and in 1592 he fetched her to Paris, where she bore him several children. He created her marquise de Monceaux and duchesse de Beaufort, and was so infatuated that, had she not died suddenly at Paris, April 10, 1599, he would have divorced Marguerite de Valois and made her his queen. *Consult Life* (in French), A. Desclozeaux, 1889. *Pron.* Estray.

**Estrella**, SERRA DA. Range of mountains of Portugal, in the prov. of Beira. Lying midway between the Tagus and the Douro rivers, virtually forming the watershed between the Mondego and the Zézere, it reaches its highest point in Malhão, 6,540 ft. A verdure-clad range, it commands extensive views, and runs, from S.W. to N.E., a distance of 75 m.

**Estremadura**. Province of W. Portugal, S. of Beira. It is divided into the districts of Leiria, Santarém, Lisbon, and Setúbal. Its otherwise regular coast-line is broken by the estuaries of the Tagus and the Sado rivers. N. of the Tagus it is hilly; to the S. it is low-lying with marshy land. Some parts are fertile, others barren; barely half is under cultivation. In the Tagus valley wine, oil, and fruit are produced. The manufactures are of little importance, but cork, salt, soda, and fish are exported, and herbs are grown

on the sandy plains. Area, 6,937 sq. m. Pop. 2,114,658.

**Estremadura** OR EXTREMADURA. Territorial division of S.W. Spain, co-extensive with the provinces of Cáceres and Badajoz. An arid plateau, denuded of its forests, lacking water, and depopulated by emigration to S. America, it is largely barren, heath-covered waste or undulating pastureland, feeding huge droves of migratory sheep and pigs. Principal rivers are the Tagus and Guadiana. The soil is naturally fertile, but agriculture is hindered by drought and locusts. Wine, olive oil, cork, figs, and almonds are produced, and oak and chestnut woods afford food for swine. Minerals exist but mining is backward. There was heavy fighting on the Estremadura front late in 1938 at the end of the civil war. Area 16,054 sq. m. Pop. 1,303,784.

**Estuarine Deposits**. Accumulations of sediment transported by a river and laid down near its mouth. They depend on grade of sediment, strength of current, and depth of river. Frequently the dropping of sediment, caused by the checking of the stream by the sea, forms a barrier across the mouth, and lagoon conditions are established inside. In former geological periods such conditions have resulted in deposits marked by comparatively limited extent, usually sandy facies, and accompanied by characteristic vegetation and animal remains (shellfish, etc.), e.g. inferior oolite beds of Yorkshire.

**Estuary** (Lat. *aestus*, tide). Arm of the sea into which a river flows. As a rule an estuary consists of the drowned lower portion of a valley. Where the land slopes gently down below sea level and the shores are wider apart nearer the open sea the estuary is a *ria*, or drowned river valley; the indentations of S.W. Eire belong to this type. The indentations of the Norwegian coast, the fjords, are steep-sided, deep estuaries which are shallow near the entrance; they are due in part to glacier action. On some coasts estuaries arise from the emergence above the water of sand banks, which transform a bay into a lagoon filled with river water. Such estuaries are the *haffs* of the S. shores of the Baltic. British estuaries are notably more extensive than the rivers which now flow into them; thus inconformity indicates submergence. Estuaries tend to be filled up with alluvium, the Dee estuary being

thus almost useless for navigation. *See* Coast; River.

**Eszék** OR OSIJEK. Town in the N. of Yugoslavia. It is on the right bank of the Drave, 125 m. by rly. N.W. of Belgrade, and is the first important town above the confluence with the Danube. Here one rly. crosses the Drave from the N. and four lines radiate S. of the river to various centres in Slavonia. As the capital of Slavonia, Eszék is a busy trading centre and is strongly fortified. Silk factories and flour mills derive their motive power from the river. Pop. 40,337.

**Esztergom** OR GRAN. City of Hungary, on the right bank of the Danube, 38 m. by rly. N.W. of Budapest. It is the eccles. capital, having been the birthplace of S. Stephen, king of Hungary. The cathedral (1821-70) was said to be the finest building of its kind in Hungary. The centre of an agricultural and vine-growing district, it is noted for its thermal springs. Below the town the Danube flows in a contracted valley and makes its great bend to the south.

At Esztergom was the river bridge for road traffic from Budapest to the Little Alföld. In the Second Great War it was entered by Marshal Tolbukhin's forces on Dec. 26, 1944, during the Russian offensive resulting in the investment of Budapest. The Germans made desperate efforts to relieve Budapest, and the Russians were compelled to evacuate Esztergom on Jan. 7, 1945. They did not retake it until March 25. Pop. 17,360.

**Etah**. District and town in India, in the Agra division of the United Provinces. The area of the district is 1,719 sq. m. Sixty p.c. of the land is cultivated, among the chief crops being wheat, barley, maize, grain, cotton, sugar-cane, and indigo. The headquarters of the district are situated in the town of Etah, which dates from the 14th century. Pop. of dist., 984,760.

**Etah**. Settlement on the coast of Greenland. In Prudhoe Land on Smith Sound, it is inhabited by Eskimos.

**Étampes**. Town of France, in the dept. of Seine-et-Oise. It stands on the Juine, 38 m. by rly. S.S.W. of Paris, and has a number of small industries, including flour-milling, but is chiefly a market for agricultural produce. In the Middle Ages it was comparatively more important, and its old buildings included the churches of Notre Dame, S. Basil, S. Gilles, and S. Martin;

and the 16th century hôtel de ville. Francis I made one of his mistresses duchess of Étampes. Here also was a house once occupied by Diana of Poitiers. Étampes, included after June, 1940, in German-occupied France, was liberated by U.S. troops Aug. 22, 1944. Pop. 10,425.

**Étang** (Lat. *stagnum*). French word for a shallow sheet of water somewhat similar to a lagoon. These are frequent in the S.W. part of France, bordering the Bay of Biscay. One of the largest is the Étang de Berre, in the dept. of Bouches-du-Rhône. It has communication by the Passe de Martigues, a narrow channel, with the Gulf of Foz and the Mediterranean. Its area is about 81 sq. m., and its average depth is 20 ft. It is noted for its eel fisheries and salt works.

**Étaples.** Town of France, in the dept. of Pas-de-Calais. It stands on the estuary of the Canche, 17 m. S. of Boulogne, and near the coast. It is the railway terminus for Paris-Plage, and is a fishing centre. In early days it was a flourishing port, and here, in 1492, England and France made a treaty. The First Great War created a temporary Étaples of wider dimensions, as an important British military base and training station. It expanded N. along the main road to Boulogne, a city of hospitals in that direction. On May 19, 1918, the Germans made a night air raid on its hospitals, causing about 300 casualties. The British war cemetery on the Camiers road, visible from the main Boulogne-Paris rly., contains 11,000 graves. See Cemetery plate, facing p. 1889. In the Second Great War Étaples was captured by the Germans during their rapid advance on Boulogne, which they entered on May 23, 1940. The town was liberated by units of the 1st Canadian army on Sept. 4, 1944.

**Etawah.** District and town of India, in the Allahabad division of the United Provinces. The district has an area of 1,669 sq. m. Fifty p.c. of it is under cultivation, the chief crops being wheat, gram, millet, and barley; cotton is also grown. Etawah town is on the Jumna and on the East Indian rly., 60 m. S.E. of Agra. It contains a mosque and a number of Hindu temples. Trade consists largely in ghi, gram, cotton, and oilseeds. Pop. dist., 883,264, 90 p.c. Hindus; town, 53,114.

**Etching** (Ger. *ätzen*, to corrode). Method of engraving on metal either by biting with an acid a

design drawn through a ground specially laid on the metal, or by drawing with a needle directly on the metal. Of several metals used for this purpose, among them iron, zinc, and pewter, copper is by far the most common.

In etching by acid, the plate is covered with a coating of wax or other resinous substance, and to this ground are transferred the details of a drawing by laying upon it the paper upon which the design has already been made in black pencil or red chalk and

posed long enough to complete the erosion. The duration of the bath will depend upon the elaborateness of the drawing.

Soft ground etching resembles pencil drawing or lithography in its final result. The etching ground is made by mixing ordinary etching ground with about half its weight in tallow or other fat. It is laid upon the plate and blackened with smoke as for ordinary etching. A piece of thin paper is then strained over the surface of the plate, and upon this the draw-

Etching. Rembrandt with the Sabre, an etching by Rembrandt, dated 1634. Only four first impressions of this exist, one being sold in 1893 for £2,000

passing it through a hand press. The drawing is then traced with a steel needle through the wax down and into the copper, and when it is finished the plate is submitted to the action of nitric or other acid. The parts that are to come light and sketchy are exposed for a certain time to the mordant and then "stopped out" with a suitable varnish to prevent further action of the acid in these passages; the parts which contain more work and are to be darker are exposed for a further period, and when sufficiently eaten are, in turn, stopped out; the parts which contain the heavy shadows and blacks are then ex-

posed long enough to complete the erosion. The back of the paper, where the pencil point has travelled over its surface, sticks to the ground, and when the paper is removed part of the ground comes with it, leaving the lines that have been drawn marked on the ground with a grain corresponding to the grain of the paper used.

In the dry-point method of etching, the artist draws his subject with a hard, sharp steel point upon a perfectly clean, unscratched, flawless copper plate. Dry point was also employed to some extent to define the general features of a drawing that was to be finally treated by the method of line

engraving, and, on the other hand, the graver was occasionally borrowed to open up work or strengthen an effect which the unaided needle could not satisfactorily accomplish.

Etching dates from the time of Albert Dürer (1471–1528), who dry-pointed several plates in 1512 and 1518, but found it an unsympathetic medium, and abandoned etching in favour of engraving. Iron, the metal used in early experiments, did not lend itself to subtle or delicate effects. Van Dyck's instinct for form led him to what is now regarded as the secret of etching—economy of line, and dramatic contrasts in force and precision. No practitioner, however, has ever rivalled the productions of Rembrandt. His plates reveal broad yet drastic treatment; some of the finest examples include the *Ecce Homo*, and the *Three Crosses*. His landscape etchings stand apart as supreme examples of simplicity in their mastery of detail; in his numerous portraits he shows great variety of costume and character.

The greatest etcher in England during the 17th century was Hollar (1607–77), a native of Prague, who spent the greater part of his life in Britain. Of the Italians the most brilliant were Annibale Carracci, Barbieri, and Caletti, but greater was Ribera (1588–1652), a Spaniard who worked in Naples. Goya (1746–1828) stands supreme in the art of etching. In the *Caprichos*, *Proverbios*, and *Desastros de la Guerra*, he used aquatint (*q.v.*) for the backgrounds—a medium which instead of line deals with broad masses, and which was frequently used by English artists of the early 19th century to repro-

duce water-colour drawings. Goya repeatedly used an etched line as guide and basis for tonal work.

The revival of etching in England during the latter half of the

papers, decreasing successively in fineness, and polishing on cloth with fine abrasives. This leaves a smooth surface, free from scratches, similar to that shown in Fig. 1, a

Etching: preparation of specimens for microscopical examination. The same wrought iron unetched (Fig. 1, left) and etched (Fig. 2, right).  $\times 120$

19th century was due to the influence of Whistler (1834–1903), F. Seymour Haden (1818–1910), and Legros (1837–1911). The tradition was carried on by a number of brilliant technicians, D. Y. Cameron (1865–1945), Muirhead Bone (b. 1876), William Strang (1858–1921), James McBey (b. 1883), Joseph Pennell (1860–1926), and F. Brangwyn (b. 1867).

**Bibliography.** About Etching, F. S. Haden, 1878; Etching and Engraving, W. Strang and H. W. Singer, 1897; Etchers and Etching, J. Pennell, 1920; History of Engraving and Etching, A. M. Hind, 1922; The Art of Etching, G. S. Lumsden, 1925; History of British and American Etching, J. Laver, 1928.

**Etching.** A metallurgical process. Before a specimen sample of a metal can usefully be examined under a microscope, it must be carefully prepared. This involves rough shaping and grinding, fine grinding with emery

wrought iron. All that can be seen is a smooth surface with some patches of black slag, which have been forged into the iron. In order to see the crystalline structure of the metal beneath, the flowed, smooth surface must be removed by the action of acids or alkalis, or individual particles of varying composition must be revealed by differential staining. In Fig. 2, which is the same sample as before but etched in a 2 p.c. solution of nitric acid in alcohol, the boundaries of the crystals are clearly seen as dark lines separating the crystals themselves.

**Etesian Winds** (Gr. *etēsios*, yearly). The prevailing northerly winds blowing in summer in the Mediterranean region. They blow very strongly up the Nile valley, and are of great value to the dahabiyehs, to help them up the river against the current.

**Ethandun.** Name given to the great victory of Alfred of Wessex against the Danes under Guthrum in early May, 878. As a result, the Danes accepted a division of territory and Christian baptism. Edington, Wilts, is suggested as the site. See Alfred.

**Ethane.** Colourless gas ( $\text{CH}_3\text{—CH}_3$  or  $\text{C}_2\text{H}_6$ ), boiling at  $-84^\circ\text{C}$ . It is soluble in alcohol and nearly insoluble in water, and is prepared by the electrolysis of sodium or potassium acetate, or by passing a mixture of hydrogen and acetylene over finely divided nickel. It burns with a faintly luminous flame.

**Ethel.** Anglo-Saxon word meaning noble, formerly spelt aethel. It is found as a prefix to Anglo-Saxon names for both sexes, e.g. Ethelfrith and Ethelflaeda. Today it is a feminine Christian name.

Etching. The Pool of London, a typical etching by J. M. Whistler, dated 1859

**Ethelbald.** King of Wessex from 858 to 860. The second son of Ethelwulf, he assisted that king in the battle of Ockley against the Danes in 851. He married his stepmother, Judith, daughter of Charles the Bald. He was buried at Sherborne.

**Ethelbert** (c. 552-616). King of Kent, son of Eormenric, and a descendant of Hengist. He became king about 560 and was defeated by the W. Saxons, 568. In 597 his over-lordship is said to have extended over all the English kings as far N. as the Humber. His wife was a Christian—Bertha, daughter of the Frank king of Paris, Charibert—and in 597 Ethelbert was baptized by S. Augustine. He issued in 600 a code of laws known as *dooms* (*q.v.*), one of the earliest documents in English. He died Feb. 24, 616.

Another Ethelbert was king of Wessex and Kent. Third son of Ethelwulf, he succeeded his brother Ethelbald in 860 and had a difficult reign largely occupied with fighting against the Danes. He died in 866 and was buried at Sherborne.

**Etheldreda, SAINT** (c. 630-679). Abbess of Ely, often called S. Audrey. The third daughter of

Etheldreda. Her shrine in Ely cathedral to which place she was translated in 1106

King Anna of E. Anglia, she was born at Exning in Suffolk. Married first to Tonbert, an E. Anglian prince, secondly to King Egfrid of Northumbria, she shunned the married state and became a nun at Coldingham. About 672 she founded a monastery on her own estate at Ely and died June 23, 679. Ely Cathedral marks the site of her grave, and the church in Ely Place, Holborn, is dedicated to her.

**Ethelfleda** (d. 918). Eldest daughter of Alfred the Great, known as the Lady of the Mercians. Brought up at Alfred's court, she married Ethelred, earl of Mercia.

After her husband's death, 911, she became sole ruler of Mercia, which she secured against attack by building numerous fortresses. In 916 she ended the incursions of the Welsh by taking Brecknock and capturing the king's wife. She died at Tamworth, June 12, 918, and was buried at Gloucester.

**Ethelfrith** (d. 617). King of Northumbria. He was the son of Ethelric, king of Bernicia, whom he succeeded about 593. He married the daughter of Ella, king of Deira, and drove out his son Edwin. In 603 he defeated the Scots at Daegsastan, and about 613 the Welsh at Chester. He was defeated on the banks of the Idle by Edwin's protector Raedwald, king of E. Anglia, and was slain in the battle.

**Ethelred I** (d. 871). King of Wessex and Kent. Son of Ethelwulf, king of Wessex, and elder brother of Alfred the Great, he succeeded his brother Ethelbert in 866. In his reign the northern kingdoms were in the hands of the Danes, against whom in 871 Ethelred and Alfred fought six battles, the most notable being the English victory at Aescesdun, or Ashdown. The white horse at Uffington, Berks, is traditionally supposed to commemorate this success. A pious ruler, Ethelred made a pilgrimage to Rome, possibly in the hope of averting the Danish peril, and died of wounds received in battle, April 23, 871. He was buried at Wimborne.

**Ethelred II** (c. 968-1016). King of the English. Son of Edgar by his second wife Aelfthryth, he was known as the Unready or the Redeless from his inability to discern good rede or counsel. He succeeded his stepbrother Edward the Martyr in 978 and was crowned by Dunstan at Kingston. In constant conflict with the Danes, he instituted the *danegeld*, for raising tribute to buy them off. The king seems to have been incompetent rather than vicious, but could be capable of cruelty, and in 1002 a general massacre of Danes was carried out on S. Brice's day, Nov. 12, by Ethelred's command. This led to further invasions, higher *danegeld*, and eventually to the recognition of Sweyn, king of Denmark, as king of England. Ethelred fled to Normandy, 1014, but reigned again after Sweyn's death. His wife was Emma, daughter of Richard, duke of Normandy; and his son Edmund Ironside. He died April 23, 1016.

**Ethelwulf** (d. 858). King of Wessex. Son of Egbert and father of Alfred the Great, he succeeded

his father in 839, Athelstan being made king of Kent. The Danes wintered in England for the first time in his reign. In 851 he routed them at Aclea, perhaps Ockley. He went on pilgrimage to Rome in 855 with his son Alfred and brought back his second wife, Judith, daughter of Charles the Bald. On his return he made over Wessex to his son Ethelbald, who in his absence had seized Kent, which Ethelwulf retained for his own rule. He was buried at Winchester.

**Ether** (Gr. *aithēr*). In physics, according to the older theory, a tenuous, elastic medium supposed to permeate space and to fill the interstices between the particles in all forms of matter. By this theory the ether is considered to be the medium through which light waves and other electro-magnetic waves are propagated. In fact, the theoretical ether was invented to account for the wave propagation of light. The early, mechanical, theory was gradually abandoned after the publication of the electro-magnetic theory of light by James Clerk-Maxwell in 1864 and the discovery of the Hertzian waves by H. R. Hertz in 1888. A number of variant explanations were then put forward having an electrical basis for the ether.

Experiments to determine the velocity of light brought incidental problems concerned with the existence of this subtle, elastic, all-pervading medium of propagation. In 1881 Michelson and Morley made the first historic experiment on these lines, with a negative result; later repetitions brought the same result, with the exception of one carried out by D. C. Miller in 1925 at Mt. Wilson Observatory. Briefly the aim of the experiments was to find out if the velocity of a light beam projected in the direction of the imagined ether stream—*i.e.* in the direction of the earth's motion—was the same as that of a light beam projected in a direction at right angles to that of the ether stream. The two beams were sent out and reflected back to the point of propagation; here, by means of an interferometer, any difference in the time of the journey to and fro would have been disclosed by an aberration—an optical effect—but, as stated, the result showed no such aberration in almost all the experiments. These experiments called in question the very existence of the theoretical ether.

In 1905 Albert Einstein published his special theory of relativity, and ten years later his

general theory. The failure of the Michelson-Morley experiments and similar later ones to show a difference in the velocities or propagation times of the two light beams sent out at right angles offered a confirmation of Einstein's theories, which dispensed with the ether and held that a light beam, whether sent out from a stationary system or a moving system, would have the same velocity. *See* Einstein, A.; Light; Michelson-Morley Experiment; Relativity.

**Ether.** In chemistry, the term denoting a large group of carbon compounds, the molecule of which contains an atom of oxygen attached to two groups such as  $\text{CH}_3$ ,  $\text{C}_2\text{H}_5$ ,  $\text{C}_3\text{H}_7$ , etc. If the ether contains two similar groups it is called a simple ether; if it contains two different groups it is called

a mixed ether; thus  $\text{O} \begin{array}{l} \diagup \text{CH}_3 \\ \diagdown \text{CH}_3 \end{array}$

(dimethyl ether) is a simple ether but  $\text{O} \begin{array}{l} \diagup \text{CH}_3 \\ \diagdown \text{C}_2\text{H}_5 \end{array}$  (methyl ethyl ether)

is a mixed ether. The ether well known as an anaesthetic is diethyl

ether  $\text{O} \begin{array}{l} \diagup \text{C}_2\text{H}_5 \\ \diagdown \text{C}_2\text{H}_5 \end{array}$ ; it is a colourless

liquid boiling at  $34.5^\circ \text{C}$ . and has a characteristic smell; when used as an anaesthetic it is usually mixed with chloroform and alcohol; it is manufactured by cautiously heating a mixture of alcohol and sulphuric acid to a temperature of about  $140^\circ \text{C}$ .

In medicine, ether was much used as a digestive and cardiac stimulant, but today is less prescribed than other allied preparations. Ether evaporates rapidly, producing great cold, and a spray directed against the skin results in local anaesthesia permitting of the painless performance of certain surgical procedures. Its most valuable use is as a general anaesthetic, either alone or combined with chloroform. Though less directly dangerous than chloroform, it is an irritant to the respiratory passages and should not be used in cases where lung trouble might be expected to follow the anaesthetic.

**Etherege**, SIR GEORGE (1634-91). English dramatist. Of an Oxfordshire family, he studied law, but gave his time mainly to the life of a man of fashion. In 1664 his first comedy, *The Comical Revenge*, or *Love in a Tub*, was produced at the Duke's Theatre, and from that time its author's name and fame were assured. A second,

*She Would if She Could*, and then a third, *The Man of Mode*, followed, each a distinct success. *Etherege* was knighted, and in 1685 James II sent him to represent England at Ratisbon (Regensburg). From 1688 he lived mainly in Paris, where he died. *Etherege* may be described as the originator of the modern comedy of social life. His knowledge of the life of his time was complete, and his portraiture of its gallants, ladies, and their surroundings perfect.

**Ethical Society.** A society founded for the culture of morality apart from theology. Its members profess freedom from all religious

creeds, but opposition to none. The movement began in the U.S.A., largely through Felix Adler, who founded the New York Ethical Society, in 1877. It spread to England, Stanton Coit (*q.v.*) and Moncure D. Conway (*q.v.*) doing much for its advancement. South Place Ethical Society, which met formerly at South Place, London Wall, and later built Conway Hall, W.C.1, and the W. London Ethical Church, Bayswater, W., is the principal London society. The more important English ethical societies are federated in a union, the offices of which are at 4a, Inverness Place, W.2.

## ETHICS: THE SCIENCE OF MORALITY

Lord Lindsay of Birker, Master of Balliol College, Oxford

*Further information on philosophy, of which Ethics is a branch, will be found in the articles Metaphysics; Philosophy; Psychology. See also biographies of Aristotle; Green; Hegel; Kant; Plato, and other philosophers*

Ethics is the inquiry into human conduct in so far as conduct is right or wrong, or has moral value. The term good is used to denote that which possesses such value, and thus ethics is sometimes described as consisting of an inquiry into the meaning of good. It is to be distinguished from anthropology or sociology, sciences which do not exclusively refer to moral values, being mainly descriptive or scientific, while ethics is essentially reflective or philosophic. "How is human life organized and carried on?" is the question of sociology and allied sciences. "What is the aim of human life, and what the chief end of man's activities?" is the question which ethics has to answer. Starting with men's moral judgements of right and wrong, of good and bad, it asks what they imply as to man's nature, in what relation they stand to scientific and aesthetic judgements, and how and in what sense they are objective.

### Man's Choice of Action

The fundamental conception of ethics is that of value. It assumes that man is not an animal with certain fixed wants, whose different actions are merely different ways of satisfying the same fundamental needs, but that, over and above his simple physiological requirements, man has other wants, changeable and changing, between which he chooses. This act of choosing between different wants, or the preference of one satisfaction to another, is valuation.

From this valuation or appraisal of wants must be distinguished the actual steps which have to be taken to satisfy these

wants, or the discovery of means towards the ends which man has approved. Generally speaking, this may be called the sphere of economic activity, whether technical, if occupied with the adaptation of the material world to man's peculiar wants, or economic in the strict sense, if occupied with men's relations so far as they will produce most efficiently what man wants. Economic activity, then, unlike ethics, takes for granted the end of man's efforts and deals solely with the means to attain that end. It is not immoral; simply non-moral.

Some have denied that this distinction between these aspects of human conduct exists. Naturalistic ethics tries to show that man's conduct can in all respects be explained by the working of certain evolutionary laws and forces. Behaviour, it is argued, has not changed owing to any change in the conception of the end to be attained, but, being directed always to the one end of the survival and continuance of the human species, has altered only with changes in human environment. Were this conception true, ethics would become only a part of biological science. Looking more closely, however, at the struggle for survival, it is plain that both degeneracy and progress have been produced. The survival of the fittest means strictly the struggle of the fittest to survive, and the judgement that the results of the process are some good and some bad, cannot be got from the process itself, but from ethical reflection upon it. Adaptation to environment must certainly be taken into account in a history of ethics,

but no less must ethics make allowance for those variations in the ultimate standard of life for which men are prepared to struggle. The attempt to explain history by assuming that men's aims are always the same will not fit the facts.

This distinction between technical activity and conduct was first elaborated in Greek moral philosophy. The ethics of Plato deal with the good of the individual, the good of society, and the relations existing between them. Thus, in *The Republic*, he sought chiefly to determine the nature of justice as such, and the means of attaining justice in the relations of men, i.e. in society. He showed that life could be regarded as divided between a number of skilled processes or arts.

#### Plato and Ethics

Conduct, however, was not one of these, but was concerned rather with the relations between the ends of all these human processes and the relation of these ends to life itself. All the arts and activities of life he regarded as subordinate to the one purpose of life as a whole, which he called the good. This idea of the good is at once the eternal object of all human speculation, and a practical ideal capable of human attainment, such as justice or temperance. Ethics, then, was an inquiry into the good which all men sought, but the nature of which none properly understood. Greek thought sometimes regarded the good as attainable by the harmonious adjustment of human desires to one another, making pleasure, or the satisfaction of the greatest possible number of desires, the *summum bonum*, or highest good. But Plato showed that such a harmony was impossible without the recognition that certain activities or wants of the soul were higher than others. Thus, though Plato still regarded ethics as a matter of knowledge, he made clear that knowledge of the good was different from skill and involved certain emotional elements, was not in fact purely a matter of reason.

Aristotle elaborated the distinction between knowledge and moral insight, dwelling especially on the nature of the deliberate choice or will of man in his search after the good life. Here he insisted that both emotional and intellectual elements must be recognized, and pointed out that in an art the end existed outside the means, calling therefore for knowledge, while in conduct the end lay within the act itself, a recognition of moral insight.

Greek moral philosophy, however, preoccupied with the notion of the supreme good, remained intellectualistic, as may be seen in its difficulty in explaining that outstanding fact in human conduct, moral conflict and the weakness of the will. Characteristic also was the Greek identification of ethics with politics. The relations of men with each other were conceived as analogous to those of the different desires within the individual, a manifold to be reconciled within the harmony or unity of the good life, that is, according to Aristotle, the complete exercise of man's rational functions which differentiate him from the rest of creation. Other important schools of Greek ethical thought were those of the Cyrenaics and Epicureans, who interpreted morality in hedonistic terms, and those of the Cynics and Stoics, who held rational virtue to be an end in itself.

In modern times the greatest influence has been the growth of the natural sciences with their view of nature as one deterministic system. This assumption made a sharp contrast with the Christian, and especially the Protestant, insistence on the absolute worth of the individual, and so has focussed ethical inquiry on the problem of the freedom of the will.

#### Immanuel Kant

The modern point of view is represented better by Immanuel Kant than by anyone else. He regarded the outstanding fact of conduct as the contrast between what *is* and what *ought to be*, and emphasised the impossibility of deriving the latter from the former. However much we may learn of the influence of heredity and environment upon human action, the statement that an action is wrong implies that it ought not to have been done, and therefore need not have been done. Here is the contrast with the deterministic conceptions of modern science. The possibility of alternatives of action is as fundamental for human conduct as determinism for the natural sciences.

How the two are to be reconciled is a matter for metaphysics. Ethics is content to show that conduct implies a definite principle of action, not inconsistent with man's heredity or environment, but different and underivable from such influences. The judgement of value, then, so closely bound up with conduct, is seen to tell us something about the nature of man.

How its underivable and immediate character is consistent with the change and development of ethical judgements in history; how ethical

progress takes place in the developed moral insight of individuals; how ethical progress finds expression in a system of social rights and obligations; how moral judgements imply something more than the mere results of human reasoning, and yet may have an objectivity different from, but as real as, that of scientific judgements—these are the questions with which ethics is concerned.

Mackenzie, 5th ed. 1915; *Civilization and Ethics*, A. Schweitzer, 3rd ed. 1946.

**ETHIOPIA** OR **AETHIOPIA** (Gr. *Aithiopia*). In ancient geography, name given by the Greeks to the whole of Africa from the Red Sea to the Atlantic, in a narrower sense to the territory comprised in the modern Nubia, Sennar, Kordofan, and part of Abyssinia. The name, derived according to Greek popular etymology from *aithēn*, to burn, and *ōps*, face, was originally applied to all countries inhabited by persons of dark-brown or black colour, the result of the heat of the sun. In the Homeric poems the Ethiopians are described as dwelling on the uttermost confines of the earth, a pious and blameless people, often visited by the gods. According to Herodotus, they were divided into the straight-haired Ethiopians of the E. and the curly-haired Ethiopians of the W.

From the earliest times the history of the country was intimately connected with that of Egypt, which was more than once under the rule of Ethiopian kings. The first Ethiopian kingdom was that of Napata (mod. Merawi), founded about the 11th century B.C. After the invasion of the country by Cambyses in 524 B.C. the capital was removed to Meroë (Assur, near Shendi) in the S., and a new kingdom arose which lasted until about the beginning of the Christian era, chiefly ruled by princesses called Candace, probably not a name but a title like Abgar and Pharaoh. The Romans made expeditions into the country, in one of which (24 B.C.) the Ethiopians suffered a severe defeat; but the conquered territory was abandoned by order of Augustus. The name Ethiopia is also given to a Christian kingdom established in the Abyssinian highlands, with capital Axumis (mod. Axum). This was the origin of the empire of Abyssinia, the official title of which is still Ethiopia.

The inhabitants of Ethiopia were of Semitic origin, and spoke a language called Geez, which showed greater affinities with the Arabic of the Sabaeans in S. Arabia than with classical Arabic. The alphabet was perhaps of Phoenician origin. There was an Ethiopic version of the Bible, including various apocryphal books added to both the O.T. and the N.T. Geez was superseded by Amharic as the official language, but continued to be used in the churches and in literature. It is now represented by two dialects, Tigre and Tigrai. See Abyssinia.

**Ethmoid Bone** (Gr. *ethmos*, strainer, sieve; *eidos*, form). Bone which projects downwards from the frontal bones of the head. It enters into the formation of the floor of the cranium, the orbits or eye-sockets, and the deeper parts

Ethmoid Bone. Left, front view of the bone; right, side view

of the nose. Roughly cuboid in shape, it is of a spongy, porous consistency, a very complicated structure, and contains a number of small cavities.

**Ethnography** (Gr. *ethnos*, nation; *graphein*, to write). Branch of ethnology (*v.i.*), which comprises the study and description of various social groups, in reference to their distinctive material characteristics.

## ETHNOLOGY: STUDY OF PEOPLES' LIVES

H. J. Fleure, D.Sc., F.R.S. Author of *The Negro and His Characteristics*

*The different ways in which peoples in various parts of the world, and at varying stages of development, conduct their society are studied in ethnology. Cognate subjects are Anthropology; Family; Tribe. See also articles on American Indian; Celt; Slav; and other human groups*

Ethnology is the science which studies the lives of the peoples. The modes of life among mankind have developed, with many diversifications, from a general original dependence on the collection of food—nuts, fruits, some leaves, probably small animals, honey, manna, shore animals, fish, etc. Hardly any peoples, if any at all, have remained at this primal stage. In the Old Stone Age, probably hundreds of thousands of years ago, man learned to stand erect and to preserve, if not at first to make, fire. With these advances he became a hunter, making pitfalls and later developing spears and arrows for action at a distance; the women and children and those unable to run with the hunters meanwhile went on collecting.

The surviving hunter-collectors include the Australian aborigines, some Bushmen of S.W. Africa, pigmies of the African equatorial forest, the people of the Andamans, forest people of a few spots in India, Malaya, and some of the islands off S.E. Asia. The Eskimo are functionally akin to these groups as are several groups of American Indians, but probably their case is more complex. This mode of life requires usually more than 1 sq. m. per person, and groups are typically small with little differentiation of rank or function, but with joint action

by a number of men who collectively resent intrusions of other groups into the territories over which they habitually range. Present day hunter-collectors are but lingering groups, usually in unfavourable environments (desert or damp hot forest), remnants of an old order that has nearly passed away, usually wandering considerably, though the Eskimo may make durable winter houses of stone and return to them, and some S.W. Africans have a group of huts arranged around a dancing floor or ceremonial space. There may be some council of heads of families, some scheme of initiation of, at any rate, the boys into the work of hunting, and into marriage, which may be polygynous if a man is prosperous enough. Customary taboos affect the choice of a wife and are often said to be aimed at avoidance of very close inbreeding, though this is not always very accurately secured.

### In the Old Stone Age

The hunting-collecting mode of life was characteristic of the Old Stone Age, late in which, perhaps less than 100,000 years ago, desert areas increased in N. Africa and S.W. Asia, and peoples there were driven to the neighbourhoods of the Nile, Euphrates, etc., where the care of seed-yielding grasses (cereals) evolved among the women as a supplement to collecting—

here we have the basis of the story of Eve. Cultivation probably began before 5,000 B.C. Use of stone for hoeing brought forth the idea of rubbing stones to shape them, and soon of cracking them and softening some (metallic ores) in the fire. Thus a Neolithic, cultivating phase evolved as a preliminary to the dawn of metallurgy. Cultivation with the hoe, chiefly by women and enslaved men, was supplemented by spade cultivation, more particularly as work for men, and by ditch digging on the flood plains of the rivers as they became cleared of bush. Thus cultivation brought an increasingly settled life, and among the early cultivated plants were spelt-wheat, emmer-wheat, barley, millets, and probably some fleshy roots and bulbs as well as perhaps some beans.

To Africa south of the Sahara there spread the cultivation of millets, beans, and some roots, supplemented later by banana-growing, introduced from Asia, but few flood plains were available and cultivation has typically been in bush clearings which become exhausted after a few years and need time to recover. The group of cultivators resents the intrusion of other groups into an area it is using or is likely to use; and usually the elders, or a chief, may hold the land and give permission to members of the group to clear and use a patch, or a patch for each wife if the man has more than one. Individual or negotiable property in land is outside most African peoples' native experience.

### Domestication of Animals

In Egypt, Mesopotamia, and some other parts of Asia cultivators early learned to domesticate animals, first the dog, then the calf, lamb, pony, and so on, and through the young their mothers also, and gradually the goat, pig, dromedary, and Asiatic elephant as well as, more or less, the cat. The male young of cattle, sheep, etc. made difficulties in the herds until men learned to castrate the surplus and to make them help in farm work, especially in ploughing—work in which the females also were and still are used.

Plough agriculture spread from S.W. Asia and Egypt over Asia and Europe, but very little into Africa. There the native grasses grow rank and coarse, poor in vitamin C, and cattle are of poor quality, often kept as a medium of exchange, especially for acquiring a wife from another group or

sub-group (this is said to be for "lobola," i.e. compensation of the woman's original group for the loss of her work when she goes into her husband's group).

Absence of ploughs, of manuring, of care of the soil, of working animals, as well as of towns, written records, institutional priest-hoods, is a feature of Africa, S. of the Sahara, with an exception to the general rule in a few cases in W. Africa. The concept of a state is little developed, save in Uganda and here and there in W. Africa. The concept of a spiritual power indwelling in a particular object, called a fetish, is widespread and should be contrasted with the idea of the sanctity of a class of objects or living things (a kind of tree or animal) found in many other regions. The village in Africa occasionally lasts for a generation or less, the people moving to a new site; the arrangement of dwellings and storehouses, etc. in the village may follow custom elaborately. Defeated and broken groups take refuge in the hot, wet forests, often at the cost of their animals, which die there from tsetse and other pests.

African food was revolutionised after contacts with America following the discovery of that continent by Europeans. Maize, manioc, sweet potato, tomato, were among the chief additions to the African menu, but varieties of yam and bean may have come in, too. In the last hundred years Europeans have penetrated everywhere in Africa, and the old order, already undermined by Arab and European slave traders, faced with a final crisis, must make adjustments (acculturation) and come into the world of commerce.

#### Hoe and Stick Agriculture

Though plough agriculture had spread to Java and the Philippines, and here and there beyond, before Europeans dominated the Pacific lands, the older agriculture of hoe and digging stick remained in the farther islands of Indonesia, Papua, Melanesia, and Polynesia, where yams, sago, taro, coconut, are all sources of food, along with pig and shore animals and fish. Cannibalism was partly ceremonial (to secure vital essence) and partly a means of keeping population within limits. Boat construction, little practised in Africa, was very highly developed by the Polynesians, who made voyages to Hawaii and New Zealand. It was accompanied by

skill in wood carving, in making tapa cloth (by hammering vegetable tissues together), and in several arts, some of which have been lost.

European intrusion brought disease and general decline of the old life, probably much accentuated by further penetrations during the war of 1941-45; and some groups, especially in Melanesia, are said to be dying out. The Maori of New Zealand, after a phase of decline, have adapted themselves remarkably and are increasing, having survived, not only their move to New Zealand some six centuries ago, when they had to give up a good deal of their former agriculture and find new foods, but the settlement of Europeans in their islands. Maori art (especially in wood) reveals a high quality. A social hierarchy is more developed in Melanesia and Polynesia than in many parts of Africa S. of the Sahara and Abyssinia, and Pacific methods of expressing relationship and marriage rules are subjects of study of great importance to the understanding of social structure.

#### Complexities of a Mixed Population

Some cultivators of the Melanesian islands are perhaps survivors of the root and tuber phase of cultivation, but the passage of Polynesians along the N. of Papua and through the Melanesian islands from Indonesia out into the Pacific has greatly influenced the life of the region. Polynesian skill in stone grinding (making Neolithic implements) is a marked feature, and inter-insular exchanges of goods are notable. It seems that many old types of skill have disappeared among small isolated groups. Indian infiltration (chiefly from S. India) in Fiji; Japanese, Chinese, and others in the Sandwich Is.; S. Arabian and Chinese in Indonesia; Dutch following Portuguese, especially in Java and Sumatra, but also in Indonesia generally; Spanish in the Philippines; British here and there, and notably (especially Scots) in New Zealand; and American in the Sandwich Is. and Samoa make the present population of the Pacific very complex socially as well as physically.

The Americas received drifts of population from N.E. Asia from late interglacial phases onwards into the Neolithic phase, but the crops and animals of farmers from the Old World did not survive the transit. Many of the pre-Columbian peoples of America

were restricted to a life of hunting and collecting or fishing, but nevertheless possessed Neolithic tools and weapons, skill in grass weaving and often in decorated pottery and modelling which in the Old World seem associated with agricultural life. In America man found food plants, notably maize, manioc, sweet potato, potato, tomato, and plantain-banana as well as varieties of palms, and America thus attained a considerable degree of equipment and settled life, with cities, calendars, states, etc., in the case of Mexico and Peru. In Peru the llama was domesticated, the only animal apart from the dog and the turkey to be tamed by man in America. It is just possible that some small groups may have drifted to America across the Pacific, but theories of pre-Columbian American life based on this supposition have on the whole failed to make themselves acceptable to expert opinion.

The Eskimo of the Arctic north are a unique case of highly specialised adaptation to a region where cultivation and herding are impossible; their skills far exceed those of most other hunter-collectors. The Eskimo and the pre-Columbian peoples of America N. of Mexico have been greatly reduced in numbers by European intrusion. In Mexico and Central and S. America, intermixture between Europeans and the earlier peoples has been much more general, and a large element of the latter survives, though their old social organization has been displaced by a system based on that of Spain and Portugal in the 16th and 17th centuries.

#### Introduction of Slave Labour

The introduction of negro slaves into Brazil, the W. Indies, and the U.S.A., and of Indian plantation labour into Guiana and Trinidad, has added further complications. Pre-Columbian forms of society survive only among relatively few groups, and then probably not unmodified, in British Columbia, the arid regions of S.W. U.S.A. and some spots in Central and S. America, notably on the plateaux of Brazil. A form of metallurgy had developed in pre-Columbian America, in Peru, more than elsewhere.

The region of traditional plough agriculture in the Old World comprises Europe, N. Africa, and most of Asia, in the damp areas (monsoon lands) of which rice is a leading crop. In the plough region there has been a sequence

of technical evolution from stone to copper and bronze and then to iron and steel and power machinery, with rise of cities, development of social hierarchies, spread of the horse as a factor of power, founding of priesthoods and growth of judicial and administrative systems, introduction of coinage as a vital factor in exchange, literacy and written records, organized war and conquest, all of which are studied as history, economics, psychology, geography, etc.

In that development the activities of the men of the great arid belt, which, with river breaks, stretches from the Atlantic coast of the Sahara to the Khingan mountains of Manchuria and beyond, have played a notable part. Most of the peoples of this belt cultivate fertile patches near rivers or other good sources of water; but, on the fringes of these areas of settlement and beyond them, there were, and in some places still are, groups which wander with herds in search of pasture. They usually depend for some food on the settled cultivators; and they are best looked upon as specialised groups who have detached themselves, more or less, from cultivation rather than as direct developments from hunter-collector groups. Nomad herdsmen, especially since they came to ride horses, have been noted for mobility and for their power of short-term organization and discipline for raids. They have again and again irrupted into settled areas, conquered the cultivators and formed themselves into an aristocracy. They have typically fused into the general settled population through intermarriage.

Ethnology thus studies the modes of life of the world's peoples, systems of land tenure and land use, crops and agricultural routines, care of soil, of domestic animals, systems of relationship and of marriage among peoples, types of settlement, social hierarchies, systems of education and ceremonies connected with major incidents in a person's life, schemes of government and administration. The term ethnography is best used for descriptions of particular groups in these and allied aspects, and ethnology may be reserved for the comparative study of groups with a view to the elucidation of principles applicable over a number of cases; few if any will be generally applicable. It must be realized that some scheme

of marriage, some expressions of the power quest, some form of education, some making of implements, some ceremonial, are found in every human group, and that group-life is a part of man's heritage from pre-human ancestors.

**Bibliography.** The Antiquity of Man, A. Keith, 1915; Men of the Old Stone Age, H. F. Osborn, 1916; Man, Past and Present, A. H. Keane, rev. ed. 1920; The Earth and Man, D. H. Davis, 1943; Taboo, H. Webster, 1943; The Dynamics of Culture Change, B. Malinowski, 1946.

**Ethyl.** Name given to the chemical group  $C_2H_5$ . There are many compounds containing this group, the names of which often begin with the word ethyl. Ethyl Acetate,  $CH_3COOC_2H_5$ , is a colourless liquid with a pleasant smell, boiling at  $78^\circ C$ , obtained by distilling a mixture of alcohol, acetic acid, and sulphuric acid; it is used in the preparation of fruit essences. Ethyl Chloride  $C_2H_5Cl$ , is a colourless gas boiling at  $12.5^\circ C$ , used as a local anaesthetic; it is made by distilling alcohol with hydrogen chloride (hydrochloric acid) and zinc chloride and condensing the vapours by a freezing mixture. Ethyl Nitrite,  $C_2H_5NO_2$ , is a liquid, boiling at  $17^\circ C$ ; a constituent of sweet spirit of nitre, which is an alcoholic solution of ethyl nitrite and other substances. Lead Tetraethyl,  $Pb(C_2H_5)_4$ , is a liquid, boiling at  $92^\circ C$ : when this compound is mixed with petrol used for internal combustion engines, it prevents the premature explosion known as knocking. By the thermal dissociation of lead tetraethyl the free radical ethyl was obtained by Paneth, but it has only a momentary existence as it readily combines with another ethyl group to form butane,  $C_4H_{10}$ . For Ethyl Alcohol, see Alcohol.

**Ethylamine.** Organic base with an ammoniacal odour, burning taste, and strong alkaline character. It is liquid, behaves in most respects like ammonia, and is used in the manufacture of some aniline dyes. First prepared by Wurtz, 1848, by distilling cyanic ether with caustic potash, ethylamine is now made by Hofmann's process, in which crude ethyl chloride, a by-product in the manufacture of chloral, is acted on by ammonia. This produces diethyloxamide, which, purified and distilled with caustic potash, yields ethylamine.

**Ethyl Cellulose.** Chemical product. Although cellulose esters have been known for almost a century, it was only at the begin-

ning of the 20th century that attention was turned to the cellulose ethers, mainly by Suida, Lilienfeld, Dreyfus, and Hess. Of these substances ethyl cellulose has attained greatest success, and is widely used as a basis for plastics and coating compositions. It can be prepared by the repeated treatment of alkali cellulose with ethyl sulphate at  $50-55^\circ C$ ; seven such treatments giving an  $-OC_2H_5$  content of  $55.2$  p.c. as compared with  $54.8$  p.c. for the theoretical triethyl ether. According to patent literature, the more favoured commercial method appears to be treating cellulose suspended in  $44$  p.c. NaOH with excess ethyl chloride at temperatures up to  $100^\circ C$ .

The solubility of ethyl cellulose varies with the degree of ethylation. For plastics and lacquers the main commercial grade approximates to the di-ether with  $40-48$  p.c.  $-OC_2H_5$ , which is soluble in a wide range of organic solvents including the cheaper and readily available aromatic hydrocarbons. This wide selection of cheap solvents, coupled with the increased chemical resistance of this ether as compared with the competitive cellulose esters, has done much to contribute to its commercial success. The range of plasticisers for ethyl cellulose is unusually large, and includes, with two exceptions, all classes of materials which have been offered as flexibilising agents for coatings or plastics. Ethyl cellulose is also readily compatible with a wide range of natural and synthetic waxes. The general effect of addition of ethyl cellulose is to increase the melting point and to toughen the material, to reduce the tendency of waxes to crystallise, and to reduce tackiness of tars and pitches.

V. E. Yarsley, D.Sc.

**Ethylene** ( $C_2H_4$ ). Colourless gas prepared by the action of sulphuric acid on alcohol, and purified by passing through sulphuric acid and caustic soda. It was first investigated, 1781, by the Dutch chemists, Deimann, Paets van Troostwyk, Bondt, and Lauverburgh. It is also known as heavy carburetted hydrogen, clayl, and ethene. It is easily inflammable, burns with a luminous flame, and forms an explosive mixture with air or oxygen.

**Ethyl-hydrocupreine.** A derivative of cupreine, an alkaloid occurring in cuprea bark (*Remijia pedunculata*).

**Etiolation.** The term used in plant physiology to describe a peculiar condition which appears

in normally green plants when they are grown in darkness. The plants are pale yellow where they would normally be green and in most instances their stems are abnormally long, their leaves unusually small. Internally there is a relatively scanty development of lignified tissue elements. It is probable that etiolation results, in part at least, from the modification by lack of light of the auxins controlling growth processes.

**Etiology** OR AETIOLOGY (Gr. *aitia*, cause; *logos*, account). The doctrine of causes, of the origin of things, specially applied to the origin of diseases. By some it is classed with ontology and teleology, as a branch of metaphysics (*q.v.*).

**Etiquette**. French word introduced into English to denote a routine of behaviour established by custom. It includes court ceremonial, formalities of diplomatic intercourse, procedure in parliament, in the army and navy, etc.; rules of behaviour in social intercourse; and the code observed by professional men, especially doctors and lawyers, for safeguarding the dignity and interests of their profession. Of all peoples the Chinese attach the greatest importance to etiquette. From remote times they have codified their ceremonial, and the Book of Rites, though relatively modern dates from the 1st century B.C. Many books of etiquette rules are published in Great Britain and the U.S.A.

**Etive**. River and sea-loch of Argyllshire, Scotland. The river issues from Loch Mathair Etive and flows 15 m. S.W. to the head of Loch Etive. The loch extends 10½ m. S.W. and then 8½ m. W. to the Firth of Lorne. There are interest-

ing ruins on its shores. The river is noted for its salmon and trout, and for its magnificent scenery.

**Etna** (Lat. *Aetna*; Sicil. *Monte Gibello*). An active volcano, situated near the E. coast of Sicily, and the loftiest in Europe. Its present alt.,

10,755 ft., shows a decrease of 115 ft. since 1861. The base covers an area of about 460 sq. m., and has a circumference of 90 m., while the floor of the crater, which constantly alters and has become wider in recent years, is 9,765 ft. above sea level. In the distance Etna presents the appearance of a huge symmetrical cone, but on closer observation discloses an irregular surface, studded with some 200 minor cones, attaining 3,000 ft. in height, and broken on the E. side by the Valle del Bove, a gaping abyss from 2,000 to 4,000 ft. deep. Its slope comprises three distinct

Etive. The Argyllshire loch, famous for its salmon and trout fishing

zones of vegetation. The lower, or lava, region rises 3,000 ft. from the base, and is thickly populated and well cultivated; the middle, or wooded, region, between 3,000 ft. and 6,850 ft., is covered with forests of pine, birches, and other trees; the upper, or desert, zone is a barren waste, under snow during most of the year. Pivot of the main Axis defence line in Sicily during the campaign of 1943, the mountain was wholly in Allied hands by Aug. 14, after heavy fighting in the foothills.

The ascent is generally made from Catania or Nicolosi, and 1,100

ft. from the summit is an observatory, with accommodation for tourists. Pindar describes an outbreak in 476 B.C. Violent explosions occurred in 1169, 1527, 1669, 1693, 1792, 1830, 1852, 1865, 1879, 1886, 1892 (when a new crater was formed near Monte Gemellaro), 1899, and 1910. The eruption of 1169 partly destroyed

Catania, and that of 1693 caused enormous loss of life. Among over 80 recorded activities, recent eruptions took place in 1914 and 1928, when the town of Mascati was wiped out. Legend connects the volcano with the giant Typhōn, who is said to have been buried beneath it by Zeus, and to have caused its eruptions by his heavy breathing; and with the workshops of Hephaestus (Vulcan), wherein the Cyclopes fabricated thunderbolts.

**Eton**. Town and parish of Buckinghamshire, England, on the left bank of the Thames, opposite Windsor. Part of the par. div. of Eton and Slough, it is 21 m. W.S.W. from London. Dating from Anglo-Saxon times, it has a church in Early Decorated style dedicated

Etna. This volcano near the east coast of Sicily is still active, and the lower photograph shows it in eruption. Top, closer view of the crater

to S. John the Evangelist, 1852-54, and a noted inn, the Christopher. Pop. 4,050.

**Eton College.** English public school. Founded by Henry VI as the College of the Blessed Mary of Eton beside Windsor, and now known as the King's College of Our Lady of Eton beside Windsor, its first charter is dated 1440. A supplementary charter

Eton College arms was granted in 1441, when the buildings were begun. The original constitution (based upon that of Winchester, 1382) provided for a provost, head master, 10 fellows, four clerks, six choristers, 25 poor scholars, and 25 bedesmen. Henry Sever was the first provost, succeeded by William of Waynflete, 1443. Among the heads have been Nicholas Udall,

1505-66, John Keate, the famous flogger, 1773-1852, J. J. Hornby, 1826-1909, Edmond Warre, and Cyril Alington. Arms were granted to the College in 1449.

The founder's statutes were formally repealed in 1871. The foundation now consists of the provost, appointed by the crown, 10 fellows, who form the governing body, vice-provost, head and lower masters, one or more bursars, and two chaplains or conductors. The number of collegers (or Tugs) is 70. In 1947, in addition to the college proper, there were 25 houses and over 1,100 king's scholars and oppidans or house residents. There are 87 masters. Notable scholars have included Bolingbroke, Boyle, Canning, Chatham, Fox, Gladstone, Gray, Hallam, Kinglake, Milman, Peel, Porson, Pusey, Shelley, Swinburne, and Wellington, whose remark that Waterloo was won on the playing-fields of Eton has been explained as a reference to the fights that took place there. Ironically, these same famous playing fields were selected in 1940

Eton. The town, seen from Windsor; in the centre is the college chapel

as the chief assembly point for evacuated government officials moving from London in the event of a German invasion of Great Britain.

Of the buildings, the hall, 1448, restored 1858, is the only part built according to the founder's final plan. The Perpendicular chapel, 1442-80, originally parochial as well as collegiate, resembles that of

King's College, Cambridge, and was restored in 1848-60. The old buildings, of dark red brick, with stone dressings and clustered chimney

shafts, form three sides of a quadrangle, which is completed by the chapel. Restoration of the vestry chapel was part of the First Great War memorial. The library was built in 1729, and new buildings in 1844-46 and 1885-87. In athletics the wall game is a special feature, and the rowing boys are known as "wet bobs," the cricket-

ers as "dry bobs." The school gives its name to the stiff jacket worn by boys.

**Bibliography.** Annals of Eton, W. Sterry, 1898; Fasti Etonenses, A. C. Benson, 1899; H. St. of Eton College, L. Cust, 1899; Eton, A. Clutton-Brock, 1900; History of Eton College, H. C. Maxwell Lyte, 4th ed. 1911; Eton College, C. E. C. Hussey, 1922.

**Étoudi, L'; or LES** CONTRETEMPS (The Thoughtless; or The Mishaps). Five-act comedy by Molière. The scene is laid in Messina. The title refers to the character Léliu, who is often doing the wrong thing from right motives. His rascally servant Mascarille is the life and soul of the play, which was first produced at Lyons, 1653.

**Étretat.** Town and watering-place of Normandy, France, in the dept. of Seine-Inférieure. Facing the English Channel, 16 m. N.N.E. of Havre, it became a popular holiday resort in the latter part of the 19th century. The chief building is the Romanesque church of Notre Dame, dating in part from the 11th century. There are public gardens, a casino, and ample bathing facilities.

**Etruria** (Gr. *Tyrrhēnia*). Ancient district of Italy nearly corresponding to the modern Tuscany. To what race its inhabitants, variously called by the Romans and themselves

Eton College. 1. The School Yard and Lupton's Tower, built in the 16th century. 2. The Upper School, built 1690-91. 3. The Hall, one of the original buildings of Henry VI, restored in 1858

Tusci, Etrusci, or Rasenae, and their language belonged are problems yet unsolved. They were a warlike and enterprising people, whose power, at its height during the 7th century B.C., began to decline two centuries later. The chief authority was in the hands of an aristocratic caste called *lucumones*; the 12 principal cities were confederated, with a general council controlling matters of peace and war. They early came into contact with Rome, whose Tarquin kings were of Etruscan origin, and in 285 finally submitted to her yoke.

There is abundant archaeological evidence that the Etruscans were a wealthy, highly civilized people. Although their architecture was mainly borrowed from Greece and the East, it exhibits a certain originality. Above all, they were the first to make practical use of the principle of the arch, as in the bridges at Chiusi (*q.v.*). Their walls, unattached by cement, consisted of large blocks of stone, sometimes rectangular, sometimes roughly hewn. The Servian wall at Rome was of Etruscan construction. The tombs, all subterranean, differ according to periods and the condition of the soil. In mountainous districts they were usually chambers hewn out of the rock. Where the soil was yielding and crumbly they took the form of a *tumulus*, a conical earth-mound erected on a walled substructure, frequently having a pear-shaped ornamental top, *e.g.* the so-called tomb of the Horatii and Curiatii at Rome. The walls of the grave chambers were often adorned with paintings.

In their plastic arts, three stages have been distinguished—Egyptian, Etruscan, and Hellenic. Special excellence was shown in the preparation of clay vessels adapted from Greek models, cinerary urns, and terra-cotta sarcophagi. Numerous specimens are extant of statues, from tiny *lares* (household gods) to colossal figures, such as the she-wolf of the Capitol; and of all kinds of vessels, candelabra, silver goblets, ivory, gold, and silver thrones, and ornamented weapons. Most of the sculpture is sepulchral.

It is perhaps in painting that the Etruscans achieved the greatest success, whether on the walls of the sepulchral chambers or on pottery. The painted vases also passed through the three stages of Egyptian (or perhaps archaic Greek), Etruscan, and Hellenic. In the first the figures are of a blackish brown, in the second black, in both cases painted on the yellowish-red ground of the clay; in the third, the ground is black, the figures red.

The Etruscan mirrors are well

Etruria. Paintings discovered at Cervetri, the ancient Etruscan city of Caere, illustrating the ceremonial burning of the dead

By courtesy of Wm. Henemann

known—round or pear-shaped plates of bronze, the outer side polished and the inner adorned with figures. Some of them are very beautiful and more than anything else throw light on the national life. The Etruscans were skilled musicians, their national instrument being the flute. See *Archaeology*; consult also Manuel d'Archéologie Étrusque et Romaine, Jules Marthas, 1884; *Cities and Cemeteries of Etruria*, G. Dennis, ed. W. M. Lindsay, 1907.

**Etruria.** Ecol. district and village of Staffordshire, England. It is within the city of Stoke-on-Trent, and has its own railway station. Josiah Wedgwood established his pottery works here in 1769. Etruria Hall, where Wedgwood died in 1795, has been converted into the offices of a large iron, steel and coal works. Pop. 9,580.

**Etruria Marls.** In geology, beds of red and purple marl and clay, occurring in the upper coal measure strata of the coal-basins of the Midlands and N. of England. They are used in pottery manufacture. See *Pottery*.

**Ettlingen.** Town of Baden, Germany. It stands on the Alb, 4 m. S. of Karlsruhe. The chief buildings are a castle, standing in large grounds, the town hall, several churches, and a monastery, now put to secular uses. It is still surrounded by walls and a moat. Its industries include the manufac-

ture of paper, dating from before 1500, textiles of various kinds, and machinery. A Roman station, Ettlingen was made a town in 1227 and has since been part of Baden. It is famous for the battle fought here between the French and the Austrians, July 9-10, 1796, the French being the victors. Pop. 10,000.

**Ettmüller, ERNST MORITZ LUDWIG** (1802-77). German philologist. Born at Gersdorf, Saxony, Oct. 5, 1802, he became professor of Ger-

Etruria. Plate of primitive Etruscan work ornamented with figures depicting a ploughing scene

British Museum

man literature at the Zürich Gymnasium, 1833, and professor at the university there, 1863. His writings contributed largely to the knowledge of early German, Anglo-Saxon, and Scandinavian literatures. His best known works are a translation of *Beowulf*, 1840, and a *Lexicon Anglo-Saxonicum*, 1851. He died April 15, 1877.

**Ettrick Forest.** District of Selkirkshire, Scotland. Formerly a part of the Caledonian Forest which comprised Selkirkshire and portions of Peeblesshire and Midlothian, it was at one time a hunting ground of the Scottish kings. It is now almost denuded of its trees.

**Ettrick Water.** River of Selkirkshire, Scotland. It rises in Ettrick Pen and flows 32 m. N.E. to the Tweed, about 2 m. below Selkirk. In the churchyard of Ettrick parish are buried James Hogg, the "Ettrick shepherd," Thomas Boston, Puritan divine, and Tibbie Shiel (1782-1878), who kept the famous inn at the head of St. Mary's Loch.

**Etty, WILLIAM** (1787-1849). An English painter. Born in York, March 10, 1787, he was apprenticed to a printer in Hull. Coming to London, he began copying famous pictures, in 1806 entered the R. A. schools, and was a pupil of Lawrence. Between 1816 and 1824 he made several visits to the

*Wm Etty*

From a photo, 1849

Continent, chiefly to Italy, whence he returned with a fine sense of colour and of graceful composition. In 1824 he was elected A.R.A., and R.A. in 1828. He died in York, Nov. 13, 1849. Not until late in life did he obtain good prices for his work, probably owing to his preference for vast canvases. He excelled in the painting of the nude figure, though his literal treatment of it may still arouse distaste. Of his smaller pictures *Youth on the Prow and Pleasure at the Helm* in the National Gallery is the most popular. The nobility and dignity of his huge works, such as *The Combat* and the three *Judith* pictures at Edinburgh, and *Ulysses* and the *Sirens* in the Royal Institution, Manchester, compel admiration.

**Etymology** (Gr. *etymon*, true; *logos*, science). The investigation of the origin and meaning of words. The term dates back to the early schools of Greek philosophy, whose theories are ridiculed by Plato in the *Cratylus*, where he himself propounds some extraordinary derivations. The Stoics and Alexandrian grammarians also devoted much attention to the study of words and the parts of speech. Owing to complete ignorance of phonetic laws, the older etymologists laid down arbitrary and impossible sound changes, and even went so far as to derive words from others of opposite meaning, e.g. *lucus* (grove), *a non lucendo* (from not shining). In the Middle Ages the influence of

theology led to the attempt to derive everything from Hebrew as the parent of all languages.

Etymology as a science is of comparatively recent origin, and became possible with the introduction of a knowledge of Sanskrit into Europe by Sir William Jones. This led to a thorough examination of the vocabulary of the Indo-European languages and the establishment of certain fixed principles of sound-change which governed the changes in the form of a word in different languages.

What is called popular etymology is really false analogy, and is an endeavour to adapt the form of a word not directly intelligible to that of one more familiar and apparently related; e.g. *crawfish* (Fr. *écrevisse*), wormwood (Ger. *Wermuth*), bridegroom (A.S. *brideguma*, *bride-man*). See *Language*; *Philology*; *Place Names*.

**Eu.** Town of Normandy, France, in the dept. of Seine-Inférieure. It stands on the Bresle, 64 m. N.N.E. of Rouen. It has a few industries, flour mills, brickyards, and glass works among them, and a transit trade, but its main interest is historical. The church of S. Lawrence is a fine Gothic building of the 12th and 13th centuries, and the château, partly burned down in 1902, dates from the 16th century, when it replaced an older one. Louis Philippe, who restored it, often resided here. The name appears to be a derivative of Lat. *Augusta*.

**Euboea** (Turk. *Egripo*; Ital. *Negroponte*). A large island of Greece, in the Aegean Sea. It lies off the E. coasts of Boeotia and Attica, has a length of 115 m., a breadth varying from 4 m. to 32 m. and is separated from the mainland by a narrow channel called Euripus. The surface is mountainous with fertile valleys, pasturing large herds of cattle. Oil, wine, corn, fruit, honey, and pitch are produced, but stock-breeding is the principal occupation. The highest point is Mt. Delphi, 5,720 ft. The thermal springs of Euboea have been esteemed since ancient

*Eucharis amazonica*, a South American bulbous herb

times. The chief town is Chalcis. The island's history is merged in that of Greece and Rome. In mediaeval times it belonged to Venice. It was taken by the Turks in 1470, and in 1830 was restored to Greece. In 1941 it was occupied by Axis forces who were found to have evacuated it when British troops landed Oct. 23, 1944. Area 1,430 sq. m. Pop. 179,523. *Pron.* Ev-via.

**Eubulus** (d. 330 B.C.). Greek orator and demagogue. He was a friend of Aeschines, whose clerk he had been, and a violent opponent of Demosthenes. It was chiefly owing to him that Aeschines was acquitted when accused of treacherous dealings with Philip of Macedon. A decided pacifist, Eubulus carried a proposal that whoever suggested applying any portion of the theoric or festival fund to any other purpose, such as war, should be put to death. In 346 B.C., negotiating with Philip, he concluded a peace highly disadvantageous to Athens.

**Eucaine**, BETA-EUCAINE, or BENZAMINE. Artificially prepared alkaloid allied to cocaine. It is used as a local anaesthetic in the form of its salts, beta-eucaine hydrochloride or lactate, but has been largely superseded by newer agents of this class. It is safer than cocaine but less powerful.

**Eucalyptus** (Gr. *eu*, well; *kalyp-tos*, covered). Genus of trees of the family Myrtaceae. The name is given to it because the sepals cover thoroughly the unexpanded flowers. See *Gum*.

**Eucalyptus Gum.** Exudate of the red gum-tree of Australia. It contains tannic acid and is a powerful astringent, being used in lozenges or in gargles for relaxed throat, and occasionally prescribed in diarrhoea and dysentery. Eucalyptus oil is distilled from the *Eucalyptus globulus*, the blue gum-tree. It is used as an antiseptic and as an inhalation or spray for colds and in conditions accompanied by foetid expectoration. Mixed with an equal amount of olive oil it is rubbed in locally for rheumatism.

**Eucharis** (Gr. *eucharis*, pleasing). Small genus of bulbous herbs of the family Amaryllidaceae. Natives of Colombia, they have egg-shaped bulbs, broad, elliptical leaves with long stalks, and white flowers, from 3 to 5 ins. across. These are borne in clusters on top of a tall stem, and consist of a slender tube expanding into a cup surrounded by six sepals and petals.

**Eucharist** (Gr. *eucharistia*, thanksgiving). One of the names used from early times for the Sacrament of the Lord's Supper. The term occurs frequently in the N.T. in the general sense of thanksgiving, but for the most part without special reference to the Lord's Supper or Holy Communion. The special application of the word arose from the Gospel accounts of the Supper, in which Christ is recorded to have given thanks over both the bread and the cup. The Apostles followed His example, and thus the blessing or consecration of the elements became known as a eucharist or thanksgiving. Later the

tions prefer the primitive name of the Lord's Supper.

As the central act of worship, the Eucharist has been the cause of much embittered controversy. The history of Eucharistic doctrine exhibits two main points at issue: (1) the nature and method of the presence of Christ in, or associated with, the consecrated elements; (2) the sacrificial aspect of the service. From comparatively early times it was held that after the act of consecration, the Body and Blood of Christ are really and substantially present, and "are verily and indeed taken and received by the faithful in the Lord's Supper."

But in defining the method of the mysterious Presence, wide differences of opinion arose.

Throughout the Western Church the doctrine of Transubstantiation became, in the course of time, a matter of faith. This taught that the substance of the elements was changed into or replaced by that of the Body and Blood of Christ, so that only the accidents or appearance of the bread and wine remain. Consubstantiation taught that both substances are present as a compound substance. At the Reformation, Transubstantiation was generally abandoned by Protest-

of the sacrifice of Christ on Calvary, but not a repetition of it. The various Protestant churches altogether reject the sacrificial idea.

In primitive times the Eucharist was celebrated in the evening, but from the time of Trajan it began to be a morning service. This practice has prevailed ever since, except in the Free Churches, and is connected with the ancient custom of receiving the Communion fasting. At first the celebration of the Eucharist followed the Agape (*q.v.*) or common meal, and was probably held daily. Later on the two were separated, and as a rule the Communion service was held on Sundays and Festival days. There is evidence that in some of the larger churches daily celebrations took place, but this was not the general custom. Originally all the faithful communicated at each celebration, the catechumens, penitents, and strangers withdrawing before the consecration; but as the sacrificial aspect became emphasised, the practice of non-communicating attendance became common, all the faithful attending each service, but only communicating occasionally or on obligatory feasts.

Except the Church of Rome, all Churches from Apostolic days have given Communion to the people in both kinds. In the Roman Church the cup has not been given to the laity through fear of accidents since the 14th century; while in the Greek Church the consecrated bread is dipped in the cup, and the elements are thus given together. Throughout the Western Church unleavened bread has been used; but this practice has not been adopted by the Eastern Churches. In the Anglican Church either kind of bread is permissible. The practice of adding water to the wine is general, except in Protestant churches, on the ground that the cup was thus mixed at the Passover.

The reception of Holy Communion is a condition of membership throughout the Christian Church. The Roman Church requires at least one annual participation at Easter; the Anglican Church fixes three times a year, Easter to be one, as the minimum. See Communion; Consubstantiation; Mass; Real Presence; Sacrament; Transubstantiation.

**Eucharistic Congress.** A meeting, at first local, but subsequently of an international character, attended by R.C. ecclesiastics and laymen, and held at intervals normally of one year. The first was at Lille in 1881. That held in London in 1908 was regarded as being of special importance.

Eucharist. S. Benedict celebrating Mass, from the painting by Sebastiano Ricci (1662-1734) in the academy of S. Fernando, Madrid

consecrated elements themselves became known as eucharistia, and the service itself was called the Eucharist, as being the Christian sacrifice or offering of thanksgiving and praise.

The Eucharist is the act of united worship directly commanded by Christ Himself in the words, "Do this in remembrance of Me." It has always been the central act of Christian worship in all the churches, save in a few bodies, such as the Quakers and the Salvation Army. In the early Church it was commonly called the Oblation or Liturgy, as it is still in the Eastern Churches. The Roman Church styles it the Mass, the Anglican Church Holy Communion, while most of the Protestant denomina-

ant bodies; but no one theory took its place. The Lutheran view was nearly identical with Consubstantiation; the Anglican Church maintained the Real Presence, but without defining its method; and most other reformed churches adopted the view of Calvin that there is no Real Presence in the elements themselves, but simply a spiritual presence of Christ in the souls of the faithful.

As regards the sacrificial aspect, the Roman Church teaches that in the Eucharist there is a "true and proper" sacrifice of Christ, Who is offered to the Father as a propitiation for both living and departed. The Eastern and Anglican Churches recognize a perpetual memorial or pleading before God

**Euchlorine** (ClO<sub>2</sub>). Yellow gas formed when potassium chlorate is treated with hydrochloric acid. First prepared by Davy in 1815, it was thought to be a new oxide of chlorine, but is merely a mixture of chlorine and chlorine dioxide. An efficient disinfectant, it is sometimes used instead of chlorine.

**Euchre**. Game played with 32 playing cards, the 2, 3, 4, 5, and 6 of each suit being thrown out. There are two players, or four in partnership. The dealer gives five cards to each player, three at a time and then two, turning up the next face upwards on the pack for trumps. The knave of trumps, the "right bower," is highest card, the other knave of the same colour, the "left bower," coming next. The remaining cards of these two suits, and all those of the other suits, rank from ace (top) to seven.

In the two-handed game the non-dealer begins by deciding whether he shall play or pass. If satisfied that he can win the odd trick he says, "Order it up." His opponent then puts one card face downwards on the table and is entitled to the card turned up for trumps, but generally leaves this card until he wishes to play it. Should the non-dealer be dissatisfied, he passes; the dealer may then either take up the top card in exchange for one of his own, and play, or he may pass also. Both having passed in turn either player has the chance of going on any other suit he chooses to make trumps. If both pass again, the hands are thrown in.

Two cards constitute a trick. A player must follow suit if he can but need not take a trick unless a higher card is his only play in that suit. The game is five up. If the player ordering up succeeds in making five tricks he wins a *march*, and scores two points; if three tricks, he makes the point, and scores 1 (four tricks count the same as three). If he fails to make three tricks he is euchred, and his opponent scores 2. *Pron.* U-ker.

**Eucken**, RUDOLF CHRISTOPH (1846-1926). German theologian and philosophical writer. Born Jan. 5, 1846, in E. Friesland, he was educated at Göttingen and Berlin. He was professor of philosophy at Basel from 1871 to 1874, then until 1920 at Jena. He died Sept. 14, 1926. His views and writings show the influence of Plato and the elder Fichte. He upholds the Christian standpoint, and is the opponent of naturalism in all its forms, whether as empiri-

cism, positivism, or utilitarianism. His chief works translated into English are: *The Fundamental Concepts of Modern Philosophic Thought*, 1880; *The Problem of Human Life*, 1909; *Christianity and the New Idealism*, 1909; *Life, Work, and Travels*, 1922. *Pron.* Oyken.

**Euclase** (Gr. *eu*, well, *klasis*, breaking). Rare mineral consisting of basic silicate of beryllium and alumina. Occurring in short prisms, with a perfect cleavage it is either colourless, yellowish, green, or blue. Occasionally cut as a gem-stone, it resembles aquamarine or topaz. It is found in Minas Geraes, Brazil, in the Ural mts., Austrian Alps, etc.

**Euclides** (fl. 300 B.C.). Greek mathematician, whose more familiar name is Euclid. Little is known of his life except that he was of Greek descent, and lived and taught at Alexandria. His individuality has indeed been so merged in his works that medieval writers attempted to prove that he never existed. Besides the *Elements of Geometry*, Euclid wrote *De Divisionibus*, a collection of 36 problems on the division of areas, possibly the only survivor of many such collections.

**Euclides** (d. c. 374 B.C.). Greek philosopher. A native of Megara he founded the Megarian school, one of the so-called imperfect Socratic philosophical schools. He held that there was only one good (Reason, Truth), and only one virtue (a knowledge of this good) all else being non-existent—a Socratic modification of the Eleatic doctrine of the Absolute One.

**Euclid**. Text-book on the elements of geometry, based upon the work of Euclides (*q.v.*). The course in elementary mathematics in vogue during the latter portion of the 19th century unwittingly introduced the student to a set of brilliant exercises in deductive logic in the guise of Euclid as an introduction to geometry. Many pupils never surmounted the Pons Asinorum (Euclid I), others managed by a sheer exercise of memory to master Book I, but only the comparatively select few succeeded in enjoying Books II to IV.

Euclid has been discarded by schools for two main reasons it is unsuitable to students of school age because it is entirely deductive; it is almost valueless as an introduction to current geometry since it ignores measurement and constructive movement, both dominant in modern concep-

tions, to which Riemann's system of geometry is more applicable. *See* Geometry; Riemann, G. F. B.

**Euclite**. Crystalline granular rock, a variety of gabbro. It is characterised by the presence, among mineral constituents, of basic species of feldspar. It is well developed in Tertiary eruptive rock in the Isle of Rum, Scotland and near Carlingford, Eire.

**Eudaemonism** (Gr. *eudaimonismos*). Greek term for the theory that happiness (*eudaimonia*) is the chief end of life. This happiness, according to Aristotle, must be striven after for its own sake, not as a means to an end, and is defined by him as a perfect activity in a perfect life. The most excellent and specially human activity is that of the reason; happiness therefore is to be sought in a contemplative, otherwise a virtuous, life. Eudaemonism is to be distinguished from Hedonism (*q.v.*).

**Eudiometer** (Gr. *eudia*, fine weather; *metron*, measure). Instrument used for measuring volume changes in chemical reactions between gases. Originally designed for determining the amount of oxygen contained in a sample of air, it is now commonly used for determining the constituents of a gaseous mixture. In some forms it comprises a graduated glass tube or cylinder, either straight or U-shaped, closed up at one end and open at the other, and having inserted near the closed end two platinum wires, which are near enough to allow the passage of an electric spark through the mixture.

A Cavendish eudiometer is a vessel closed at both ends, having a screwed connexion by which it can be pumped clear of air before being filled with a gaseous mixture for analysis. A mixture of two volumes of hydrogen and one of oxygen can be exploded in a eudiometer tube to form water.

**Eudocia** (c. 393-460). East Roman empress. Daughter of the Athenian philosopher Leontius, celebrated for her beauty and intellect, she was converted to Christianity by Pulcheria, sister of Theodosius II, the latter marrying her in 421. Before conversion her name was Athenais. The two sisters-in-law, however, quarrelled over the Eutychian heresy (*see* Eutyches), and Eudocia was banished, returning to a life of good works at Jerusalem. She wrote several poems.

**Euganean Hills**. Isolated group of hills in N.E. Italy, in the prov. of Padua. Lying in the W. of the prov., they are of volcanic origin.

have numerous thermal springs, and extensive trachyte quarries. The loftiest point is Monte Venda, 1,895 ft. On their slopes are several villas and a ruined convent. They gave the title to some lines written by Shelley in 1818.

**Eugene.** City of Oregon, U.S.A. the co. seat of Lane co. It stands on the Willamette river, 125 m. S. of Portland, 50 m. from the Pacific, and is served by rly. and airport. It is the seat of the Oregon university (opened 1872). It has flour and lumber mills, brick and tile works, rly. shops, and fruit-packing plants. Eugene is at the head of navigation, and carries on a brisk trade in lumber, cereals, cattle and animal products, and canned fruit. It is a rapidly growing city, settled in 1854, and incorporated 10 years later. Pop. 20,838.

**Eugene** (1663–1736). Italian prince and Austrian soldier. Born in Paris, Oct. 18, 1663, his father was Eugene Maurice, prince of Savoy, and his mother a Frenchwoman, a niece of Mazarin. He was baptized François Eugène. Educated in France, at first for the church, he entered the Austrian army, as Louis XIV would not admit him to the French, a fact which some think gave a distinct anti-French impetus to his military career. His early experiences were gained fighting against the Turks, and his advance was rapid in his profession.

In 1691 Eugene held a command in Italy, where by 1693 he had won several successes over the French. In 1697, in command of the imperialists in Hungary, he crushed the Turks at Zenta. In 1701, when the War of the Spanish Succession broke out, he was sent to Italy, where again he won considerable successes over the French. In 1704 began the association with Marlborough which has linked together the two names in history. The prince helped in the battle of Blenheim, but when Ramillies was fought (1706) he was again in Italy where his outstanding feat was the capture of Turin. He fought at Oudenarde, but after the English had withdrawn from the struggle, he advised his master, the emperor, to do the same. This

counsel being taken, he arranged in 1714 the peace of Rastatt.

Next began one of Eugene's greatest campaigns, the one that made him the idol of the Austrians. In the war against the Turks that opened in 1716, he won a victory at Peterwardein, and a greater one when he captured Belgrade. A period of peace followed, the prince serving as governor for the Netherlands, and then as the emperor's representative in Italy. In 1734 he led the Austrians in the War of the Polish Succession, and on April 21, 1736, he died in Vienna.

The greatest of all the soldiers who have served Austria, Eugene was responsible for the only period in her military history that can be called glorious. He had a passion for war, the genius that knew instinctively when risks could be taken, for several of his victories were won over greatly superior forces. He was interested in art, and left a magnificent collection of pictures. The prince never married. There are Lives by G. B. Malleson, 1888; P. Frischauer, 1934; Sir G. MacMunn, 1934.

**Eugène Louis Jean Joseph** (1856–79). A French prince. The only son of Napoleon III and Eugénie, he was born in Paris March 16, 1856, and was usually known as the Prince Imperial. Having undergone a military training at Woolwich, 1872–75, he joined the British expedition to Zululand in 1879. He was killed near Ulundi on June 1.

**Eugenics** (Gr. *eugenēs*, well born). The study of agencies under social control that may improve or impair the racial qualities of future generations. That is the original definition of eugenics by the coiner of the word and the founder of the study, Sir Francis Galton (*q.v.*), cousin of Charles Darwin. Before his death in 1911, Galton founded the Galton and Eugenics laboratories at University College, London, and the Eugenics Education (later the Eugenics) society. The two former were essentially research organizations for the study of human heredity and breeding, while the primary object of the latter was the general diffusion of the knowledge gained. The society, however, also plays a considerable part in initiating and financing pure research. These three parent bodies now have equivalent organizations in most parts of the civilized world, and eugenics has become, like its parent science biology, a subject of international interest.

Eugenics has one fundamental premise, which aroused widespread hostility when it was first enunciated during the 19th cent., since it was a development of the then revolutionary theory of evolution, which contradicted the biblical creed of the special creation of man. It is that human beings inherit qualities just as do other animals. A country, therefore, which is concerned with the quality of its citizens, should have regard to their nature as well as their nurture, *e.g.* to their native health and intelligence as well as to their feeding and teaching at school. A subsidiary biological premise lends urgency to the eugenic attitude. That is, that natural selection—the survival of the fittest, in the widest sense of the term—is today profoundly modified by social agencies. Whereas among wild animals or mankind in primitive states the healthiest and most intelligent, broadly speaking, live to be the parents of the next generation, a civilized human community tends (a) to preserve, and permit to breed, mentally and physically defective individuals who would not in a primitive culture survive childhood; and (b) to put a premium through economic conditions on celibacy and childlessness among the most vigorous and successful in the community.

#### Heredity and Vital Statistics

The study or science of eugenics—as distinct from its practical application—is therefore simply a branch of biology, and one that falls naturally into two parts—the study of human heredity, and the study of birth rates, death rates, marriage rates, and similar relevant population statistics. Population and eugenics, indeed, are simply the quantitative and qualitative aspects of the same thing.

Human heredity, likewise, is very largely studied by statistical methods. The biometrical (life measurement) approach initiated by Galton himself is essentially statistical, and so are the methods of analysis of that science of genetics (study of heredity) which developed during the last half-century from the original studies of the Abbé Mendel (*see* Mendelism).

Owing to the popular prejudice against regarding man as an animal, much of the earlier eugenic literature was devoted to proving that human heredity conformed to the ordinary laws of genetics and general biology. That case can now be considered proved. More is known today, indeed, about the heredity of man than about that of

Prince Eugene,  
Austrian soldier  
From a contempor.  
portrait

any other animal, barring a few small, fast-breeding species studied in laboratories. For the past quarter of a century, therefore, emphasis has been directed more to the intensive study of the inheritance of special human characters, normal and subnormal, and to the eugenic aspects of population trends, *e.g.* to finding out the birth and survival rates of the "social problem group" (*q.v.*) in relation to those of the general population. The objects of the practical eugenic measures that are advocated are both negative—to check racial deterioration—and positive, to raise the racial standard. Sterilization of the certifiably unfit—chiefly the insane and mentally defective—is one negative measure proposed. Closely associated with it is the finding and teaching of methods of birth control simple enough to be used effectively by the simple-minded. A third recommended measure is to call a halt to the provision of indiscriminate state assistance which, eugenicists claim, puts a premium on irresponsible parenthood.

The positive objective of increasing reproduction among the ablest and fittest can, eugenicists believe, be achieved by such economic and social measures as would foster among them early marriage and families with a minimum of three children. They advocate especially granting selective family allowances for professional men on a scale that would prevent the rearing of a family from depressing the family man's economic status below that of his celibate or childless fellow professional. Eugenicists consider education, especially in bringing up the young to think eugenically in choosing a mate and producing children, of great importance in the development of both positive and negative eugenics.

#### Limited Range of Study

The weakness of the eugenic case is that as the life-span of the investigator into human heredity is no longer than that of his subject, his study is limited to at most three generations. Conclusions which one investigator from this limited range of observation may consider established might well be nullified by wider observation. The negative objective of preventing reproduction by subnormal human beings appears to be more soundly based than that of the positive objective: the assumption that the gifted and successful will necessarily produce better offspring than the normal is by no means established. See

Biology; Genetics; Heredity; Mendelism; also Birth Control; Birth Rate; Death Rate; Population; Vital Statistics.

**Eugénie** (1826–1920). Empress of the French. Daughter of the Spanish count de Montijo, she

Eugénie, Empress of the French

was born at Granada, May 5, 1826. She went to France in 1851 and married Napoleon III on Jan. 30, 1853. Under her influence the French court became a centre of luxury and extravagance. She was partially responsible for the disastrous French expedition to Mexico in 1863–66 in favour of the Emperor Maximilian, and encouraged Napoleon to embark upon the war with Prussia in 1870. After the French defeat at Sedan, she fled to England, where she was joined by the emperor, and they settled at Chislehurst. Napoleon died in 1873, and her only son, Eugène the Prince Imperial, was killed in 1879 while serving with the British army in the Zulu campaign. The ex-empress moved to Farnborough, Hants, in 1887. She died July 11, 1920, while on a visit to Spain. Together with Napoleon III and her son, she is buried in the mausoleum at Farnborough. *Consult* *Memoirs*, Comte Fleury, 1920; *Lives*, M. Paléologue, Eng. trans. H. Miles, 1928; R. Sencourt, 1931; O. Aubry, 1939.

**Eugenius**. Name of four popes, of whom two are notable. Eugenius III, pope 1145–53, was born Bernardo Paganelli at Pisa, where he was educated and ordained. He joined the Cistercian Order, came under the influence of Bernard of Clairvaux, and was made abbot of the monastery of Tre Fontane at Rome. His elevation to the papacy coincided with a revolt against the temporal supremacy, and he was driven to Viterbo. The activities of Arnold

of Brescia (*q.v.*) compelled him to leave Italy, 1146. In France he promoted the second crusade, and promulgated measures for the reform of the clergy. It was not until shortly before his death, July 8, 1153, that, thanks to the intervention of the emperor, Frederick Barbarossa, he was able to return to Rome.

Eugenius IV, pope 1431–47, was a Venetian named Gabriel Condolmieri and a monk of the Celestine order. He was bishop of Siena before being chosen pope. He was engaged in a struggle with the Colonna family, and then with the council of Basel, which refused to dissolve on his order in 1431, the recalcitrants of the council declaring him suspended and deposed, and electing the anti-pope Amadeus of Savoy (Felix V). Outside a comparatively small party, however, Eugenius maintained his position as rightful pope. During 1433–43 he was driven to live at Florence by a revolt of the Romans. He effected a temporary union with the Greek and Armenian churches, 1439. He died Feb. 23, 1447.

**Eugenol**. Chief constituent of clove oil (80 to 90 p.c.). Obtained by distilling cloves, and from pimento-leaf oil, it has the same spicy odour as clove oil, from which it is separated by caustic potash. Eugenol is used medicinally as a carminative, and frequently as a palliative in toothache, a pledget of cotton-wool wetted with eugenol being inserted into the hollow tooth. Commercially eugenol is of importance in the manufacture of vanillin.

**Eugubine Tables**. Seven large bronze tablets found in 1444 in a vault near Gubbio (ancient Iguvium, medieval Eugubium), in central Italy. They are covered with inscriptions in Umbrian and Latin, one in both languages, in excellent preservation. The oldest date from 200 B.C. They embody almost all that is known of the Umbrian dialect and throw valuable light upon the religious customs of ancient Italy. The text contains the proceedings of a priestly corporation named the Attidian brothers, a code of religious ceremonies with directions for auguries, sacrifices, and expiatory ceremonies. See *Inscriptions*.

**EuheMERUS** (4th century B.C.). Greek rationalist. A native of Sicily, and a follower of the Cyrenaic school, he lived at the court of Cassander, king of Macedonia. EuheMERUS was the author of a *Sacred Register*, in which he tells

how, having been sent by Cassandra to the Indian Ocean, he landed in the mythical island of Panchaea. Here he discovered, inscribed on a golden pillar in a temple of Zeus, a history of the world, the study of which led him to the conclusion that the gods and heroes were nothing but supermen, on whom divine honours had been bestowed after death. These ideas survive in the modern term Euhemerism. His writings were translated into Latin by Ennius, and fathers of the church made use of them as arguments against paganism.

**Eulenspiegel**, *INL.* Name of a peasant to whom were ascribed the jests and practical jokes in a popular Low-German collection of the late 15th century (now lost). The High-German version, the basis of all subsequent editions, was printed in 1515. Eulenspiegel is supposed to have been an actual person, who died in 1350, and his traditional grave is shown at Mölln. His story was widely popular in Europe and in England, and is the theme of an epic novel by the Flemish writer, de Coster (1868), and the basis of a symphonic poem by Richard Strauss (1895). See Tyll Owlglass.

**Euler**, *LEONARD* (1707-83), Swiss mathematician. Born at Basel, April 15, 1707, he became professor of mathematics at St. Petersburg, 1733, and at Berlin by Frederick II's invitation, 1741, returning to Russia in 1766. He died there Sept. 18, 1783. He was an accomplished mathematician and prolific writer, doing valuable work in mathematical analysis in revising and coordinating the existing branches of pure mathematics, and in a study of planetary motions. His name was given to the Eulerian numbers, coefficients of expansion.

**Euler-Chelpin**, *HANS KARL AUGUST SIMON VON* (b. 1873). German-Swedish chemist. Born at Augsburg, Feb. 15, 1873, he studied chemistry at Munich, Berlin, and Paris, and in 1898 became a lecturer at Stockholm university. After his marriage to the daughter of a Swedish nobleman he was naturalised Swedish, and during 1906-41 held the chair in chemistry at Stockholm. He specialised in chemistry of plants, especially of moulds, and was director of the biochemical institute and institute for research in organic chemistry. His researches and publications on fermentation were important for the food and pharmaceutical industries, and he was awarded the Nobel prize for chemistry in 1929.

**Eumaeus** (Gr. *Eumaios*). In Greek legend, the faithful swineherd of Odysseus, to whom his master revealed himself when he arrived in disguise in his native Ithaca after 20 years' absence. Eumaeus afterwards helped Odysseus to slay the suitors of Penelope (*q.v.*). *Pron.* U-mē-us.

**Eumenes** of *CARDIA* (c. 360-316 B.C.). Private secretary to Philip of Macedon and Alexander the Great. He accompanied the latter on his Persian campaigns, and on Alexander's death, in 323 B.C., became ruler of Paphlagonia, Cappadocia, and Pontus. After a four years' struggle with Antigonus (*q.v.*), he was taken prisoner by the latter and put to death. See Craterus. *Pron.* U-men-eez.

**Eumenes**. Name of two kings of Pergamum. Eumenes I reigned 263-241 B.C., but Eumenes II, who reigned 197-159 B.C., is the more important. Realizing that his interests lay in recognition of the power of the Romans, he entered into an alliance with them, assisted them in the war against Antiochus the Great, taking part in the battle of Magnesia, and was established by them as ruler of Mysia, Lydia, Phrygia, Lycaonia, and Pamphylia. His lukewarmness in the war against Perseus, king of Macedonia, caused him to be suspected of intriguing with the enemy, and he never completely regained Roman favour. Under his rule Pergamum became a city of great magnificence. Eumenes founded a library said to rival that of Alexandria. See Pergamum.

**Eumenides** or *ERINYES*. In Greek mythology, avenging deities who pursued those guilty of crime, especially crimes against the family and crimes of bloodshed. They are represented as winged women with snakes sprouting from their heads instead of hair, and bearing torches and scourges. They were three in number—Tisiphone (avenger), Alecto (unceasing, relentless), and Megaera (jealous). Erinyes was the older name, Eumenides (the kindly) being a euphemistic title, bestowed upon them after they had abandoned their persecution of Orestes. In Attica they were by preference called Semnai, the awful goddesses. They were propitiated by wineless libations of water, milk, and honey. Furiae and Dirae were the Roman equivalents. *Pron.* U-meni-deez.

**Eumenides**. Tragedy by Aeschylus, last of the trilogy Oresteia. The subject is the trial of Orestes before the Areopagus (*q.v.*) for the murder of his mother, Clytemnestra.

The Erinyes act as prosecutors, and Orestes, who is defended by Apollo, is acquitted by the casting vote of Athena. The play ends with a panegyric of Athens and its venerable court of justice, and the Erinyes are propitiated by their name being changed to Eumenides. See Agamemnon; Choephoroi.

**Eumolpus** (Gr., sweetly singing). In Greek mythology, son of Poseidon, the sea-god, by a mortal mother, Chlōnē, who, in remorse, threw the infant Eumolpus into the sea. He was saved by Poseidon, and after many adventures reached Attica, where he perished in a war with Erechtheus, the Athenian king. He was credited with being the founder of the Eleusinian mysteries, and his descendants, the Eumolpidae, were priests at Eleusis throughout the history of ancient Greece.

**Eunuch** (Gr. *eunē*, bed, *ekhein*, to keep). Word originally applied to a man in charge of the women's apartments in Oriental countries, but afterwards to a castrated attendant in the harem. The custom of entrusting women to eunuchs has prevailed in the East since Babylonian times, and was imitated by the later Roman emperors. These eunuchs frequently acquired great power and high position. In modern times lads were castrated in order to preserve their clear boyish voices. Italian churches employed *castrati* in choirs, but Leo XIII abolished the practice in 1878. From time to time religious fanatics have undergone self-mutilation, the Skoptsi, of Russia, being notable examples. The only Christian self-castrate of note was Origen.

**Euonymin**. Extract of the bark of *Euonymus atropurpureus*, the spindle-tree of the U.S.A. It is useful for constipation associated with disturbance of the liver. See Spindle Tree.

**Eupatoria** or *YEVPATORIA*. A seaport and industrial town of Russia. It stands on the W. coast of the Crimea at the N. end of Kalamita Bay, 40 m. N.W. of Simferopol. Its Tartar name was Gyuzleve, Russian Kozlov. In 1783 it was taken from the Tartars by the Russians, who renamed it Eupatoria, after the ancient town founded by Mithradates VI the Great, King of Pontus. In 1855-56 Eupatoria was occupied by Anglo-French troops. Bombed by the Germans during the assault on the Crimea, Eupatoria was evacuated by the Russians in Oct., 1941, and in Jan., 1942, was vainly attacked by them. It was recaptured from

the Germans by units of the 4th Ukrainian army on April 13, 1944. The industries concern machinery and chemicals. The town contained a Karaite Jewish synagogue, a mosque on the plan of S. Sophia, Istanbul, and a Greek Catholic cathedral. Pop. approx. 23,000. See Crimean War.

**Eupatridae** (Gr. *eu*, well; *patēr*, father). Nobility of Athens and Attica, supposed to be descended from the ancient heroes. The rest of the inhabitants were roughly divided into Geomori or farmers, and Demiurgi or artisans and traders. As the kingship declined, the influence of the Eupatridae increased until they virtually governed the state. Their influence was checked by Draco's code of laws, providing for the administration of justice equally among all classes, and ended by the constitution of Solon. See Draco; Solon.

**Eupen.** District and town of Belgium. The territory known as the Kreis (circle) of Eupen lies S. of Aix-la-Chapelle (Aachen), and covers an area of 400 sq. m., with a pop. of about 60,000. It is fertile, with rich pastures and meadows, and its chief industry is dairy farming. It contains Eupen, Raeren, Kammerdorf, and Conzen. The town, the administrative centre of the Kreis, has a pop. of about 13,500. It is on the Weser, 10 m. S. of Aix-la-Chapelle, and makes woollen goods, paper, soap, and machinery. It has iron-foundries, breweries, and tanneries.

Formerly part of the duchy of Limburg, Eupen was under the government of Austria until 1801, when by the peace of Lunéville it passed to France. In 1814 it was given to Prussia, later forming part of the Rhine province until 1919. The town reverted to the old French name of Néaux (*q.v.*). By the treaty of Versailles, Germany renounced in favour of Belgium all rights and title over the territory comprising the whole of the circles of Eupen and Malmédy. Belgian troops occupied Eupen on May 26, 1919, taking it over from the French. The Germans occupied Eupen on May 10, 1940, the day they invaded the Low Countries; and the town was reincorporated in the Reich on May 18. It was captured by U.S. armoured units on Sept. 11, 1944. *Pron.* Oy-pen.

**Euphausiacea.** Order of crustacea (*q.v.*) containing only a few genera. Together with the dactyopoda (the large order containing lobsters, crabs, etc.) they make up the group called the eucarida in which the carapace fuses with all the

thoracic segments, forming the familiar solid covering of *e.g.* the crab. Most euphausiaceans are about the size of large prawns. They form the food of the great whales which in their turn provide man with huge supplies of oil and fats. They are plentiful in the S. Polar seas, and much work has been done on their ecology in relation to the whale fisheries, for instance by the Discovery expeditions.

**Euphemism** (Gr. *eu*, well; *phēmē*, voice). Substitution of refined and delicate words for coarse and vulgar words conveying the same idea. The object is to disguise as far as possible painful or unpleasant subjects which yet must be referred to. In English literature the device was widely over-used in the Victorian era, when gentility required that the term "unmentionables" should replace "trousers," "nether limbs" disguise "legs," etc. Later writers have tended to abandon this practice. By extension, the term is applied to an expression such as "passed away" for "died," which is intended to mitigate the austerity of a simple statement.

**Euphonium** (Gr. *eu*, well; *phōnē*, sound). Brass wind instrument of the saxhorn family. Of

Euphonium,  
4-valve instrument  
By courtesy of  
Hawkes & Co.

bass pitch and tone, it is of the same pitch as the baritone saxhorn, but its bore is wider and tone fuller. The euphonium is the chief bass solo instrument in military bands, and often doubles the melody an octave below the cornets. It also plays bass parts with the heavier bass instruments, bombardon, bass tuba, etc. Euphoniums are made in C and B flat, both played as non-transposers. In brass bands the B flat euphonium is sometimes written for on the treble stave, when it becomes a transposer, and the notes are placed a major ninth higher, *i.e.*

The open notes of the B flat instrument are:

and its three, four, or five pistons complete the scale, and give a chromatic compass of over three octaves.

**Euphorbiaceae.** Large family comprising trees, shrubs, and herbs. They mostly possess milky juice

Euphorbiaceae. Two species: left, sea spurge; right, dwarf spurge

and grow in all parts of the world except the Arctic zones. The leaves are all undivided, and either alternate or opposite. The sexes are always in separate flowers without petals. About 3,500 species are known, including spurges, mercury cassava, castor-oil plant, croton hevea (producing rubber), etc. Preparations of *Euphorbia pepus* and *E. pitulifera* are sometimes used in medicine, to relieve conditions associated with difficult breathing. The order is named after a Greek physician, Euphorbus (1st century B.C.). The box and a few allied genera formerly included in the Euphorbiaceae, now form a distinct family, the Buxaceae.

**Euphorbus.** In Greek mythology, a Trojan hero slain by Menelaus. Pythagoras, who taught the transmigration of souls, believed that he himself had once been Euphorbus, and in proof he unhesitatingly identified the shield of Euphorbus in the temple of Hera near Mycenae as his own.

**Euphrates.** The western river of Iraq, flowing over the alluvial plain to join the Tigris and enter the Persian Gulf. One of the notable rivers of antiquity, the joint valley was the home of the earliest civilization. The river, called Frāt by the Turks, rises in N.E. Turkey, about lat. 40° N. The parent streams, the Kara Su and the Murad Su, originate well over 1 m. above sea level. Both flow at first west between snow-capped ridges; the Kara Su crosses the plain of Erzerum, and is a big river, 200 ft. in width; it breaks through the southern ridge by a series of rapids, receives the Murad Su at Keban Maden, flows still W. and then breaks through a second ridge by a long, narrow gorge, to enter the Malatya plain at a level of about 2,600 ft. The

Murad Su, which rises near Mt. Ararat, has a wilder course than that of the Kara Su, and receives greater quantities of melted snow.

From the plain the Euphrates has a rocky course through the Tauric mts. to Samsat, falling 1,500 ft. in about 100 m., to emerge on to the lowland and fall 1,000 ft. in 1,800 m., a broad, majestic stream crossed until quite recently only by primitive ferries. In the neighbourhood of Aleppo, Syria, the river is but 80 m. from the N.E. corner of the Mediterranean Sea, but almost immediately turns definitely S.E. on its way to the Persian Gulf. The lowland course is in a sandy trough, comparable to that of the Nile in Egypt; a narrow bordering strip is cultivable by the use of river water; it receives only one important tributary, the Khabur, and consequently decreases in volume by excessive evaporation.

During hot summers it becomes fordable; nearer Kurna, where it joins the Tigris, it percolates into marshes, losing still more water. The combined stream is the Shatt-el-Arab. The Euphrates has no large modern town on its banks, but ancient Babylon was beside the river. The stream is navigable for small craft to Birejik on the caravan route to Syria. Its total length is about 1,700 m.

**Euphuism** (Gr. *euphuēs*, clever). Name given to the artificial style in which John Lyly (*q.v.*) couched his famous romance *Euphuës*, the *Anatomy of Wit*, 1579, followed in 1580 by *Euphuës and His England*. The characteristics of this "new English" were the balanced antithetical sentences marked by elaborate alliteration, the excess of classical allusion, and the extravagant drafts upon natural history for purposes of moral reflection. The high artificiality of euphuism carried the seeds of decay within it, and it died before the 16th century was out. Scott claimed to have modelled Sir Piercie Shafton in *The Monastery* on the euphuistic fashion which prevailed for some years.

**Eupolis** (d. c. 410 B.C.). Athenian comic writer. He was a con

Euphrates. Tomb of Ezra near Kurna, at the junction of the Euphrates and the Tigris

temporary of Aristophanes and Cratinus, with whom he was associated by Horace and others as one of the chief representatives of the old comedy. Among his comedies, of 12 of which fragments remain, were *Kolakes* (the Flatterers), ridiculing the wealthy Callias, a patron of learning; *Marikas*, an attack on the demagogue Hyperbolus (*q.v.*), represented as a slave; *Dēmoi*, lamenting the unhappy condition of the state under the encroachments of democracy; and *Baptae* (the Dippers), an exposure of the licentious practices of Alcibiades.

**Eurasian**. Term originally denoting the offspring, and their descendants, of a European father and a Hindu mother. It was formed out of the continental names, about 1820. The term now denotes any mingling of European and Asiatic blood; and, in physiology and ethnology, natural or ethnic characters common to both continents.

**Eure**. River of France. It rises in the dept. of Orne and flows through the depts. of Eure-et-

wheat is grown. Horses, sheep, and cattle are reared, a great deal of fruit is cultivated, and the peasants export butter and eggs. The Seine borders the dept., which is also drained by the Eure, Rille, and other tributaries of that river. Evreux, the capital, Elbeuf, Les Andelys Bernay, Verneuil, and Louviers are the chief towns. Before the Revolution, Eure was mainly part of Normandy. Its area is 2,330 sq. m. Pop. 315,902.

**Eure-et-Loir**. Department of France. An inland dept. in the N.W. of the country, it is flat and fertile in the S. and E., but less so in the N. and W. The former is included in the plain of Beauce, while the latter is known as the Perche and the Thimerais. The chief rivers are the Eure, Loir, and their tributaries. The most important products are wheat and oats. Apples are grown, while cattle, sheep, and horses are reared. Chartres is the capital, and Dreux and Châteaudun are other towns. Before the Revolution the dept. was partly in Normandy and partly in Orléanais. Its area is 2,291 sq. m. Pop. 258,110.

**Eureka** (Gr. *heureka*, I have found). Exclamation of Archimedes (*q.v.*), when he ran naked from his bath through the streets of Syracuse after discovering a method of detecting the alloy in the gold of Hiero's crown.

**Eureka**. City of California, U.S.A., the co. seat of Humboldt co. It stands on Humboldt Bay, 284 m. N.W. of San Francisco, and is served by rly. and airport. A port of entry, it is largely engaged in shipping lumber, obtained from the redwood forest region in which it is situated. It has fisheries and also ships dairy and poultry produce. Settled in 1850, it was incorporated in 1856. Pop. 17,055.

**Eurhythmics** (Gr. *eu*, well; *rhythmos*, measured motion). Art of expressing harmony by gestures

Loir and Eure to the Seine, which it enters near Pont de l'Arche, not far above Rouen. Its length is about 70 m. and Chartres is the chief place on its banks.

**Eure**. Department of France. In the N.W. of the country, it is a fairly level area, and the soil is fertile. Much of it is covered with forest but elsewhere

Eurhythmics. Two attitudes in a plastic exercise in this rhythmic method of physical training

in which physical movement is made to reflect musical notation. It was invented by Émile Jaques-Dalcroze (*q.v.*), professor of harmony at Geneva Conservatoire, towards the end of the 19th century. Time is shown by movements of the arms and notes by movements of the legs. The unit is the crotchet, which is indicated by a single step, longer or shorter notes being shown by a step with one foot and movements with the other. The various exercises relate to rates and changes of speed, dynamic expression, syncopation, phrasing, etc., and are made by both arms and legs.

**Euripides** (480–406 B.C.). Athenian tragic dramatist. According to tradition, he was born on the island of Salamis on the day of the great naval victory over the Persians. A pupil of the sophist Prodicus, he seems to have been at first intended for a professional athlete, and secondly, for a painter, but soon took to writing for the stage. In 455 B.C. he exhibited his first tragedy, and in 441 gained the first prize for the first time. The last few years of his life were spent at the court of King Archelaus in Macedonia, where he died.

Euripides,  
Greek dramatist

Euripides was credited with over 90 plays in all, of which 18 survive. He gained the first prize only five times, his contemporaries apparently regarding him as inferior to both Aeschylus and Sophocles and other dramatists. His vogue increased, however, after his death, and though never the favourite of the critics, he has been the favourite dramatist of many of the world's poets, notably Virgil, Horace, and Milton. Euripides is undoubtedly a master in the handling of the tender and the pathetic. Aristotle truly called him "the most tragic" of the poets. A reputed misogynist he has yet portrayed women as fine as any to be found in all literature. As a playwright also Euripides stands high; there is an excitement about his plots and a vividness in his situations, although they sometimes verge on the ridiculous, which are lacking in the plays of Aeschylus and Sophocles. Euripides is, in fact, the most human of the three dramatists, and this quality of humanity accounts for his greater popularity

in subsequent ages. Among the blemishes of his art may be mentioned his artificial prologues and his too frequent use of the *deus ex machina* (*q.v.*) or divine intervention in unravelling a plot.

The extant plays of Euripides are: *Alcestis*, *Medea*, *Hippolytus*, *Hecuba*, *Andromache*, *Ion*, *The Suppliants*, *Heracleidae*, *The Mad Heracles*, *Iphigenia among the Tauri*, *The Trojan Women*, *Helen*, *The Phoenician Maidens*, *Electra*, *Orestes*, *Iphigenia at Aulis*, *Bacchae*, *Cyclops*, the last being the only extant specimen of a satyric drama. The *Rhesus* is certainly spurious. Of the plays perhaps the best are *Alcestis*, notable for its exquisite delineation of woman's devotion; *Hippolytus*, the tragic story of the illicit love of *Phaedra*, a plot used by Racine in his

between the island of Euboea and the mainland of Greece. See *Chalcis*.

**Euroclydon** (Gr. *Euros*, east wind; *kydōn*, wave). Name given in Acts 27, v. 14, to the gale which, blowing off Crete, seized the ship in which S. Paul was wrecked on the coast of Malta. The form adopted in the R.V. is *Euraquilo*, meaning a tempestuous N.E. or E.N.E. wind of the Mediterranean.

**Europa**. In Greek mythology, daughter of Agenor, king of Phoenicia. While she was playing one day with her maidens, Zeus appeared in the form of a white bull, and Europa was induced to mount on the animal's back. The bull thereupon carried her off over the sea to Crete, where by Zeus she became the mother of Minos, Rhadamanthus, and Sarpedon.

She was worshipped under the name of *Hellotis* in Crete.

**Europa**. German liner. Built at Hamburg by Blohm and Voss, for Norddeutscher Lloyd, the Europa was a sister ship of the Bremen (*q.v.*) and was launched in 1928, but damaged by fire and not completed until 1930. She displaced 51,650 tons on a length

Europa. The story of Europa depicted by Paolo Veronese  
*Doge's Palace, Venice*

*Phèdre*; and *Bacchae*, a brilliant glorification of the worship of Dionysus or Bacchus. The plots of Euripides were all drawn from the old mythology, yet the characters are not cast in heroic mould, but act and talk like Athenian men and women of his time. Euripides was accused by his contemporaries of endeavouring to undermine faith in the gods and in morality, and for this supposed tendency, as well as for his alleged bad art, he was bitterly attacked by Aristophanes. See *Greek Literature*. *Prom. U-rippi-deez*.

**Bibliography.** Text with notes ed. F. A. Paley, 1857–60; Verse trans. with parallel text, A. S. Way, 4 vols, 1912; trans. of individual plays by Gilbert Murray; *Life and Works*, J. P. Mahaffy, 1878; E. the Rationalist. A. W. Verrall, 1895; E. and His Age, G. Murray, 1913; E., a Student of Human Nature, W. N. Bates, 1930

**Euripus** (Gr. *euripos*). General name for a narrow channel, specially applied to the strait

of 940 ft. and a beam of 101 ft.; eight triple sets of turbines allowed a speed of 26.5 knots. On her maiden voyage to New York she set up a new record by crossing from Cherbourg to Ambrose Light in 4 days 17 hours 6 mins.; in 1932 she bettered her own record by 3 hrs. 15 mins. In 1935 this time was beaten by the French liner *Normandie*. Throughout the Second Great War the Europa was laid up at Bremerhaven; in 1945 she was taken over by the U.S. government for conversion into a troopship; and in 1946 taken over by the Compagnie Générale Atlantique and renamed *Liberté*. On Dec. 8 that year she sank in Havre harbour, but was raised in April, 1947.

**Europa Point.** Headland at the extremity of the peninsula of Gibraltar, Spain, just S.E. of Europa Bay. To the N.W. is Little Europa Point and to the E. Great Europa Point. Europa Bay is a small circular inlet in the S.W. coast of the peninsula just S. of Shingle Point.

# EUROPE: ITS GEOGRAPHY, CULTURE, HISTORY

E. STERN-RUBART, A. D. INNES and G. P. GOOCH, D.Litt

*Europe, in many respects of climate and other natural features the most favoured of the land masses of the earth, for a number of centuries dominated the world, both militarily and economically. Its rise, its long period of power, and its disruption by wars are here described. For the story of Europe after 1945, see N.V.*

Europe, smallest but one of the earth's continents, takes its originally Greek name from the Semitic word *ereb*, dark; it is the Occident, as compared with the Orient of Asia. In fact it is a huge peninsula of the greatest continent, Asia, with which it forms Eurasia—a term meaning the Old World in comparison with the New, i.e. American, hemisphere. The borders between Europe and Asia are conventional ones determined neither by a clear-cut difference in physical conditions, nor by a racial or linguistic distinction. Europe covers just over 4 million sq. m., with about 500 million inhabitants.

Its outstanding physical characteristic is the deep inroad made by the sea into its surface. This produces a coastline with a length of 23,250 m., slightly longer than that of Africa. This coastline embraces a dozen peninsulas, of which the most extensive are Scandinavia, Finland, Kola, in the N., and the Iberian, Balkan, and Italian peninsulas in the S.

## Influence of Sea on Climate

These inroads of the sea into the land also affect the climate of Europe, which is dominated virtually all over the continent by oceanic air currents and temperatures; and while Europe's greatest distance W. to E. is 3,150 m., and N. to S. nearly 2,500 m., the furthest inland city (Sverdlovsk in the Urals) is only 800 m. from the sea, and excluding Russia, only a fraction of that distance. The coast is surrounded by islands which link it, in the S.E. with Asia by the Greek archipelago, in the S. with Africa by Sicily, in the N.W. with America by the British Isles. The narrow strip of the Bosphorus, and the 10½ m. strait of Gibraltar separate it from Asia and Africa respectively. The 100-fathom line runs from the Spanish coast to the Bay of Biscay and from there sweeps around the British Isles to the S. of Norway, whose rugged coast drops deep into the sea; including the comparatively flat and shallow North and Baltic Seas, the continent of Europe, together with its submerged parts, is therefore considered as stretching to beyond the W. of Ireland.

Physically, Europe is the continent with the lowest average altitude—1,000 ft., against e.g. 3,200 ft. over Asia; plains, up to 650 ft., cover 60 p.c. of its surface; its highest mountain range, the Alps, reaches 14,600 ft., the Carpathians 8,100 ft., the Gran Sasso in Italy nearly 8,900 ft., the Mulahacen in the Sierra Nevada 10,600 ft., and the Pic d'Aneto in the Pyrenees just under 10,400 ft. A great variety of other mountains have peaks of 4,000–7,000 ft.; as watersheds, they account for the fluvial system.

## Rivers and Canals

Its greatest rivers flow across the plains of the E., the principal one being the Volga with a length of 2,500 m., followed by Dnieper, Don, and Dvina. Europe's second longest river, the Danube with 1,780 m., has wound its way through mountain ranges. With the Rhône, the Po, and the Rhine, it belongs to the Alpine watershed, though the mouths of these rivers are far apart. The Vistula, Oder, and Elbe, three great central European rivers, have likewise the area of their sources in common, between the Tatra and the Sudeten Mts.; the same applies to most Spanish rivers. As most of the navigable rivers from the French Atlantic coast to the Gulf of Finland cross the plains in a slow and steady flow, they have been linked by a network of canals which, in France, connects Atlantic with Mediterranean; in Germany, North Sea with Baltic, North Sea with (via Danube) Black Sea; in Russia, Caspian with Arctic and Baltic, Baltic with Black Sea.

**GEOLOGY.** The oldest parts of the continent are in the N. and extreme W., from Ireland to Finland, consisting mainly of igneous Archaean rock. The huge E. plain which covers European Russia, Poland, Denmark, N. Germany, and the Low Countries is the result of erosion from the mountains in the S., and glaciation in the N., during the Diluvial period. All folds S. of the belt of Archaean rocks are considered as consequences of a process which started during the Mesozoic, and reached its climax during the Tertiary period. Folded mountains arose, either by tectonic pressure,

or by the eruption of huge masses of magma; the latter in particular accounts for the mountains of W. Scotland, the French central massif, the Eifel W. of the Rhine, and the Bohemian mountain chains. Farther south however, frequent earthquakes and volcanic eruptions produced folds of great length, by lateral pressure (this process has not entirely died down, as indicated by continuing volcanic activity—Vesuvius, Etna, Lipari Islands) and, by counteraction, created simultaneously deep grooves and plains, such as the Hungarian Alföld and the plains of the river Po. The latest tectonic transformation took place during the Diluvium, when the Baltic and North Seas came into being by slow subsidence of their soil, and Asia and Africa were separated from Europe. During that period all N. Europe inclusive of the British Isles was covered with ice, while the approaches of the high mountains were penetrated by glaciers such as still remain in the Alps. In the neighbouring plains the diluvial deposits—moraines, sand, etc.—mostly determine the character of the soil, and to some extent the climate.

## Rich Variety of Minerals

This great variety of geological transformation to which Europe was subjected accounts for its comparative wealth in minerals. It yields iron ore in Sweden, Britain, France, Germany, Austria, and Russia; zinc in Britain, Italy, and Germany; tin in Britain and on the Czech-German border; lead in Britain, Spain, Czechoslovakia, and Germany; copper in Britain, Sweden, Russia, and Germany; platinum, gold, and silver in the Urals, the last two also in the Carpathians; mercury in Spain and Carinthia. Coal is widely distributed, but particularly in Britain, Belgium, Germany, and S. Russia. Petroleum is found in Rumania, Poland, Russia, and to a smaller extent in Austria, Hungary, Hanover, and Alsace. Bauxite comes mainly from France, Hungary, and Switzerland. Many rare radio-active elements have considerable deposits on European soil.

The tectonic origin of Europe's surface produced a number of

lakes, most of which, however, were the results of the diluvial floods. The largest are Ladoga with 7,100 sq. m.; Onega, 3,600; Wener, in Sweden, 2,200; Wetter, likewise in Sweden, 730; Balaton, in Hungary, 250; Geneva, 225; Constance, 205 sq. m. Other remnants of the great flood still exist as swamps in Russia, along the Pripet river and near the Caspian, but most are subjected to systematic drainage.

**CLIMATE.** Except for its arctic N., Europe belongs to the moderate zone of climate; but it enjoys a milder temperature than would normally exist at its latitude. The Gulf Stream affects its W. and N. coasts, and W. winds prevail. Also the E.-W. direction of all important mountain ranges does not put obstacles in the way of the warm streams of oceanic air, which penetrate deep into the E. As a result the Norwegian coast is 35° F. and the Baltic is 22° F. warmer in the winter than the world average for corresponding latitudes. The same applies to the N. of Scotland—35° F. above the average in Jan.—and, with a decreasing curve, to all parts near the W. and N.W. shores. The 32° F. isotherm, which limits the area frostbound during the winter, runs from the North Cape through Hamburg, the Alps, the Balkans, the Crimea, to S. of the Caucasus, which separates Europe from Asia. In summer, temperatures are normal for the latitude.

The rainfall exceeds 60 ins. annually on the highest areas and on parts of the W. coast. The Pyrenees, Alps, Balkans, and Caucasus include districts where the rains exceed 40 ins., but most of Europe has an annual precipitation of between 20 and 40 ins. Spain and E. and N. Russia receive less than 20 ins. The Mediterranean peninsulas are lands of clear skies with a maximum duration of sunshine in excess of 2,500 hours annually. Scandinavia is a cloudy area with less than half as much sunshine.

**VEGETATION.** European flora is largely the result of its geological development. During the Tertiary period the soil was covered by tropical and subtropical vegetation; in the Diluvial period it was covered by arctic plants still found in the higher mountain ranges; and when the ice vanished, other plants, mainly from the E., immigrated with the increasing warmth and humidity. There are now four clearly distinguished

zones of vegetation: the Arctic, with treeless tundra carrying moss, lichen, and rampant shrubs; the Central European pine and leafy woods, with summer-green meadows; the Mediterranean belt, with evergreen plants and tropical palms; and the S. Russian grass steppe, branching off into Hungary.

Economic plants are the olive tree, in Greece, Italy, and Spain; vine up to about 50° N.; wheat to about 60° N. (in specially vernalized varieties, much farther N.); rye to nearly 70°; maize in Rumania, Hungary, Italy, and N. Spain; oranges, figs, and other fruits, mainly along the Mediterranean and in Portugal. Trees range from plane, chestnut, and cork-oak in the S. to beech, oak, and lime in the central zone, birch and pine in the N.

Dairy farming and cattle breeding are spread over nearly the whole continent. The fauna of Europe, except for birds and small animals, is not so much the result of climate and geology as of man's influence, which eliminated most of the larger wild animals not qualifying for domestic exploitation.

**POPULATION.** Europe's inhabitants can be placed roughly in three large main linguistic or racial groups: Latin, Germanic, and Slavonic. Embraced by both the former are the small remnants of the Celts; by the latter those of the Balts. Finns and Hungarians, Greeks, Albanians, Turks, Basques, some Jews, and gypsies belong to none of the three main groups which, together, represent 90 p.c. of Europe's population. The number of different languages is about 70, half spoken by at least one million people each, 13 of them within European Russia; the other half together by only 8 millions. See table p. 3179.

#### Religions of Europe

The religious grouping shows more than 96 p.c. Christians, of whom Roman Catholics with 44 p.c. or 220 millions (Eire, France, Spain, Portugal, W. and S. Germany, Italy, Austria, Hungary, Poland) are the strongest numerically. Protestantism, with 28 p.c. or 140 millions, is dominant among the Germanic peoples, Finns, Estonians, Letts, and in parts of Czecho-Slovakia and Hungary. The Orthodox churches count about 25 p.c. or 125 millions among the Eastern Slavs, Greeks, Rumanians, and other Balkan nations. There are about 12 million Mahomedans, and before 1939 there were 9-6 million Jews.

After the Second Great War (treating Germany as one national unit) Europe held within its

#### STATES OF EUROPE, 1947, IN ORDER OF POPULATION

Andorra

boundaries seven large states, with over 20 million inhabitants each; 10 medium ones, with between 5 and 20 millions each; ten small ones, with below 5 millions; and four midget states, with under 100,000 each. In extent of territory, however, Sweden ranks fourth among the great powers (above Germany); Finland and Norway sixth and seventh respectively, above Poland; Iceland 16th, above Hungary; and the Netherlands and Belgium, between Switzerland and Albania.

Virtually none of these European nations has a completely homogeneous population. In Switzerland the largest part speaks a German dialect, two smaller ones French and Italian, and a fraction Romansch. Belgium is split between the French element of the Walloons and the Germanic Flemings. France has Germanic Flemings and Alsatians, Celtic Bretons, and Basques. Great Britain has Germanic, Celtic and older elements. Germany has Nordic, Dinaric, and Alpine races, and Slavonic remnants; Italy, Lango-bardian and Moorish strains; while Russia, dividing her own people into Great Russian, Ukrainian, and White Russian, contains numerous partly Asiatic populations. In Spain are Iberian and Celtic elements, infiltrations of Germanic Goths, Vandals, and Semitic Moors and the larger part of the remaining aboriginal Basques.

The density of population, indicative likewise of the state of civilization and economic activity and prosperity, varies widely. A belt of the densest population, with over 250 per sq. m., reaches from Lancashire and Yorkshire, through London, the Netherlands, and Belgium, along the Rhine to the Alps, through the centre of Germany (Thuringia, Saxony), S. Poland, deep into the industrial area between Kiev and Stalingrad. An extension runs S. of the Alps from Lombardy through the Italian peninsula to Sicily. Along these belts are situated all the areas of densest population, with more than 500 inhabitants per sq. m.

Apart from the mountainous districts—the Scottish Highlands, Pyrenees, Alps, Carpathians, etc.—and large parts of the Scandinavian peninsula, areas with fewer than 20 inhabitants per sq. m. are found only in N.E. Russia, around the Caspian, in Finland, and on the Spanish plateau (which became sterile in consequence of senseless and radical deforestation in the Middle Ages).

#### How Religion Affected Civilization

European civilization and culture are, to a large extent, linked with religious development. Springing from the Mediterranean (Greece and later Rome), civilization shifted its centre slowly, first to the Romance countries until, in the Middle Ages and later, the Germanic nations came to share it, while the E. Mediterranean and the adjacent Balkans lost their predominance, largely after conquest by the Turks. The E. of Europe, partly because of its Orthodox Church with Byzantine influence, and the influx of Asiatic populations, developed a civilization independent of the general European one. The comparatively high degree of European culture is largely the result of its great variety of conditions. Its numerous geographical sectors have easy access one to another, and this exchange has prevented localised stagnation. The general standard of education is highest in the N. and N.W., lowest in the E. and Spain, though in Soviet Russia the number of illiterates is rapidly dwindling.

**INDUSTRY.** The belt of densest population is identical with Europe's main economic arteries. Agriculture, favoured by the large extent of the plains and the comparatively mild climate, continues to play a primary part in Europe's economic life, while the incomparable coast has made fishing more significant than on any other

continent. Industrial development, based upon the exploitation of large coalfields, took place in the course of little more than the 19th century. Apart from the zones of densest population mentioned, main industrial centres are the heart of Sweden, the Rhône valley, Catalonia and the Basque N. of Spain, and a few big cities, e.g. Paris, Berlin, Hamburg, Warsaw, and Moscow.

#### Gradual Exhaustion of Natural Resources

Between these and other parts of the continent there is an exchange of raw materials and finished goods, although the exploitation of Europe's natural resources, especially ores, has long reduced the available quantities so as to make imports from overseas a necessity. Iron ore, for many European countries, comes mainly from Sweden and Spain, but gold, silver, copper, and mineral oils mainly from outside Europe. The continent's proportion in the world production of coal, iron, zinc, and lead is rapidly dropping, partly because of greater American and Asiatic Russian output. Europe mined 60 p.c. of the world's coal in 1900, but only 45 p.c. in 1929. For steel the corresponding figures are 65 p.c. and 35 p.c.

Industrial development in specific areas is due to historical factors like the transformation of domestic crafts into mass-production. Thus, specialised textile industries are found in Lancashire, N.E. France and Belgium, S. of the Ruhr in Krefeld and Wuppertal, in Saxony, Czecho-Slovakia, Austria, Switzerland, N. Italy, in Lyons (for silk), in Lodz, and around Barcelona. Glassware and ceramics flourish in Britain, Belgium, Thuringia, and Bavaria, Czecho-Slovakia, and along the German-French borders. Electrical and chemical industries, comparatively independent of proximity to heavy raw materials, have developed in or near London, Manchester, Paris, Marseilles, Berlin, Cologne, Frankfurt-on-Main, Mannheim, Halle, Zürich, Milan, Vienna, Prague, Brno; the same applies to motor car, optical, photographic, and other industries. Watches are a speciality of Switzerland; before the Second Great War, toys were a speciality of Nuremberg and Thuringia; clocks of S. Germany; women's fashions originate in Paris, sports equipment in Great Britain, etc.

In order of industrial development the countries can be listed as follows: Great Britain, Belgium, Germany (pre-war), France, Italy,

Switzerland, Czecho-Slovakia, Austria—these last two forming a transition from the agrarian to the industrial state; the Netherlands and Norway, important trading, if not industrial, countries; Spain and Sweden, exporters of raw materials and foodstuffs; Poland, with coal, zinc, and timber, and Rumania, with petroleum, agrarian countries with less developed industries. The Balkan states, Portugal, and Eire are countries whose economic life is based exclusively upon agriculture. European Russia, though building large industries since about 1925 on a Communist basis, is still essentially dependent upon farming and forestry.

**COMMUNICATIONS.** Europe's geographical structure and position in relation to other land masses favoured its growth as a world centre of communications. Transport throughout the continent itself benefited from the many navigable rivers, the wide plains, and the early rise of chains of settlements, and Europe possesses a close network of highroads and railways, insufficient only in the E. and S.E. The Danube, Vistula, Volga, Elbe, Rhine, and Loire, and to a lesser degree the Oder, Weser, Seine, serve as national, and some of them as international, waterways, and are interlinked by canals. They connect great ports whose prosperity was made possible by the many secondary seas penetrating into the continent. Most of the chief ports face the Atlantic: Hamburg, Bremen, Rotterdam, Antwerp, Southampton, Liverpool, Glasgow, Cherbourg, and Bordeaux. Others serve the Mediterranean, and include Marseilles, Barcelona, Genoa, Trieste, Brindisi, and Piraeus.

The European railway network, thickest in Belgium and next to that in Great Britain, covered, before the Second Great War wrought havoc upon it, just over 250,000 m.

#### European Air Lines

Motor highroads, a comparatively new feature, facilitated the development of road haulage on a large scale in the central and W. parts of Europe. Air lines on schedule were inaugurated in 1919 and rapidly augmented; they serve not only for the rapid transport of passengers, but of valuable or perishable goods as well. By 1939 the regular lines flown in Europe covered about 60,000 m., and total mileage flown in a year by aircraft under schedule reached 22 million miles, the number of

passengers exceeding 300,000, and freight and mail weighing 8,000-10,000 tons.

**ECONOMIC POSITION.** During the last hundred years, after it had become politically dominant, Europe, as the sphere of origin of capitalist economy, and of politico-economic colonisation, came to be the world's economic centre. Its own raw materials, however, proved progressively insufficient for requirements; in foodstuffs, likewise, Europe became more dependent on supplies from overseas, especially from the young colonial territories. In exchange for such supplies, Europe provided the whole world with finished goods and with capital. London, before the First Great War, was the world's money market and its most important wool exchange, while cotton interests looked to Liverpool, furriers to Leipzig, etc. This whole predominance of Europe was undermined by and in consequence of that war, which enriched countries overseas while forcing many hitherto industrially undeveloped ones to create their own factories, and transformed the U.S.A. from a debtor nation into the world's greatest creditor. It opened world markets for American and for cheap Japanese goods. Against such competition, Europe's weakened economic structure had an uphill struggle before the Second Great War.

#### Reasons for Europe's Economic Decay

The creation in 1919 of a number of small states all bent upon a maximum of independence from neighbours with whom previously they had been economically united; an ill-advised protectionist policy resulting therefrom; and Russia's withdrawal from European capitalist trade, were contributory reasons for the decay of Europe's economic pre-eminence. Attempts at countering these evils by pacific economic unification (see Europeanism) were opposed by Fascism and Nazism, which exploited misery and dissatisfaction in the direction of aggression. These false doctrines completed the downfall of Europe as the continent of civilization, prosperity, and leadership of the world; left it dependent for its food rations, raw materials, and working capital upon loans by the U.S.A. and colonial countries; and, though officially participating in the new United Nations organization, with severely clashing plans, aims, and ideologies among the main powers.

A movement, long rampant, but brought to a climax by the Second

Great War for the complete emancipation from Europe of the colonial peoples, was a consequence as well as a confirmation of Europe's decline (see India, Indonesia, Vietnam, etc.). Independence, if won by amicable arrangement, does not necessarily mean any decrease in the exchange of goods and services, but the political predominance over the rest of the world once possessed by Europe has ceased. Increase of skill, harder work, better scientific and technical equipment, and more nearly perfect organization of European man and his resources, and the example he may thus set in creating a harmonious, satisfied, and civilized community, can alone assure Europe any possible remaining superiority in the world.

Edgar Stern-Rubarth

**HISTORY.** The continent of Europe with its present contours emerged after the last ice age, probably not less than 20,000 years ago. For untold ages before, the greater part of it had been subjected to Arctic or tropical conditions of varying intensity, so that geologists divide the whole period into a succession of ice ages with non-Arctic intervals between them. Man had existed before the last ice age, but the new Europe was repopulated, not by the descendants of the "drift" men, but by men who, moving from warmer regions, made their way across it as the ice receded. In the course of some thousands of years tribes coming either from the east or out of Africa had spread thinly over the habitable area, settling in communities, acquiring to a limited degree the arts of agriculture, and developing the use of tools and utensils.

#### Beginning of the Aryan Invasion

Somewhere about 3000 B.C. began the migration of the Aryan races from a centre somewhere in Asia or in Russia. The presumption is that they were races hardened by life in northern and comparatively unproductive regions, and wherever they moved they went as conquerors, but rarely as exterminators. The evidence of their kinship is to be found in the evidently common origin of their languages and the common characteristics in bone and skull structure, as witnessed by their burying grounds. Those who spread over Europe are commonly divided into four main groups, Celtic, Greco-Italian, Teutonic, and Slavonic.

The first made straight across Europe to the W., dominating, though not exterminating, the

earlier inhabitants of modern France, Spain, and the British Isles. The second pushed S. towards the Mediterranean, and by 1000 B.C. were masters of the Balkan and, less completely, of the Italian peninsulas. The Teutons, moving later than Celts and S. Aryans, gradually occupied Scandinavia and modern Germany, and first came into contact with the Roman Empire when it was almost supreme over the whole area W. of the Rhine and S. of the Danube at the close of the 2nd century B.C. The movement of the Slavonic group came still later. A group of Aryans, less advanced than the Greeks and Italians, had long been in occupation of Austro-Hungary and Rumania and the mountain regions E. of the Adriatic, but whether they were nearer akin to the Greeks and Italians or to the Slavs is uncertain.

#### City States of Greece

Recorded European history begins somewhere after 2000 B.C. with pre-Aryan races who dominated the islands and coasts of the Aegean Sea, and developed an advanced civilization to which the modern excavations principally in Crete and at Mycenae bear witness. Between 1500-1000 B.C. the Hellenic Aryans mastered all the S. portion of the Balkan peninsula, the islands of the Aegean, and the W. coasts—though only the coasts—of Asia Minor. Greek political organization developed rapidly in the form known as the city state. The system was fostered by geographical conditions. Hellas, the area under Greek occupation, did not form a political unity, but was broken up into a large number of small communities, often hostile to each other, though sharing a sense of common race and tradition.

Maritime and commercial development followed naturally, as there was easy communication by sea with earlier civilizations and state systems of W. Asia and Egypt. Between 1000-500 B.C. a high political organization was attained by many city states, together with a remarkable intellectual and artistic activity. The Greeks were so far in advance of the rest of the world that it has been said that "nothing moves in the world which is not Greek in origin." The statement is not strictly true. Moving forces, notably Christianity, have come out of the East; Celts, Romans, and Teutons have all made contributions; but the truth remains that the most active forces of progress developed with the Greeks.

Later than the Greeks in the Balkan peninsula, and developing more slowly, the Latin or Italian branch of the same or of a kindred stock found its way through the passes in N. Italy, crossed the Lombard plain, and pushed S., breaking across the Apennines into the W. plains. There they fought with the earlier inhabitants, notably the Etruscans, supposed by some authorities to have been of the same race as the makers of the Cretan civilization. On the W. of the Apennines they, like the Greeks, developed politically on the city state system, the Latin states warring with each other, but uniting against the Etruscans on the N., and the new tribes of their own kinsfolk, Sabellians or Samnites, who followed them. Greeks and Italians alike seem to have passed through a stage when each state had an hereditary monarch to a stage when the monarchy was absorbed by an aristocracy, displaced in its turn by a military despotism or tyranny.

#### The Rise of Rome

The primacy among the Latin states, whose league stretched S. from the Tiber, was won towards the end of the 6th century B.C. by the Romans, whose city, Rome, founded according to tradition in 753 B.C., was the barrier fortress holding the Tiber between Etruscans and Latins.

The next 200 years formed the most brilliant period in Greek history, in which first the Hellenes stemmed the westward pressure of the Asiatic powers, then carried their own political, literary, and artistic development to its highest point, and finally, led by Alexander the Great, shattered the great empire of Persia. The passion of each state for individual independence and their mutual jealousies prevented the Greeks from building up a common national structure. Neither Athens nor Sparta succeeded in establishing her own supremacy over the rest of the states; Macedon at last won the leadership about 340 B.C., but failed to create a united empire.

Meanwhile Rome, after a severe struggle, broke up the Etruscan power, which received its *coup de grâce* at the hands of Celtic invaders from the N., who penetrated as far as Rome (394 B.C.), but then rolled back beyond the Apennines to the plain of the Po. It would appear that long after the first Celtic migration, which had passed Italy by, a second great Celtic flood poured across Europe till it collided with its own Celtic predecessors. The result was that the S. wing, being beaten

back, forced its way into Italy and occupied the N. plain.

The Romans blocked the Celtic invasion of Italy, and, freed from the severe Etruscan pressure on the N., gradually came to dominate the Latin states and the kindred tribes, first known as Sabines and then as Samnites, who were pushed down on the E. and S., after the Latin occupation of the lands W. of the Apennines. Rome, compelled by her position to maintain a political organization adapted to military needs, won in Italy an undisputed ascendancy over her rivals.

Meanwhile Hellas had attained the high-water mark of her progress with Alexander the Great, whose death in 323 B.C. left his uncompleted empire to a century of disintegration. That same century, 300-200 B.C., saw the great struggle between Rome and the Semitic power of Carthage, which had established itself in N. Africa, to some degree in Sicily, and in Spain. Carthage was not decisively crushed until 202 B.C. Italy had supported Rome in the momentous conflict; the result of which was that not only was her ascendancy overwhelmingly confirmed in Italy, but her sway was also established in the Spanish peninsula, with its mixed population of Celts and pre-Celtic Iberians.

#### Roman Power Expands

During the next 170 years (200-30 B.C.) the dominion of the Roman republic expanded. The conquests of Julius Caesar in Gaul (58-50 B.C.) completed the subjection of all Europe W. of the Rhine and S. of the Danube, including the whole Celtic or partly Celtic area, except Britain, of which the part now called England was absorbed 100 years later. But all along the Rhine and the Upper Danube, the Teutons were now pressing upon the Roman frontier. The system which had built up the might of the Roman republic was not adapted to the administration of so heterogeneous an empire. Concentration of control was a necessity. Caesar gathered into his own hands the powers which enabled his genius to shape an imperial system under a single control.

For 400 years and more, the civilized world meant the Roman empire, which covered much of Europe and parts of Asia and Africa. On its borders there was incessant war: within it reigned the Roman Peace, save when the death of an emperor afforded a commander in some distant province the chance of snatching at the imperial purple.

W. of the Adriatic and the Rhine, the peoples of the continent

became thoroughly Latinised in language and political ideas, though across the Channel Latinism was little more than a superficial veneer which touched not at all either Celtic Ireland or the Celtic north of the island of Britain. In the Balkan peninsula, Hellenism held its own against Latinism except in the one trans-Danubian province of the empire, Dacia, the modern Rumania, planted with military colonies from Italy.

Towards the end of the 3rd century A.D. Teutonic hordes were surging against the Roman barrier, pressing now southward as well as westward upon the middle and lower Danube. At the close of the 3rd century the imperial system was reorganized by Diocletian, and a few years later by Constantine, who transferred the headquarters of the empire in 324 from Rome to Byzantium, which he renamed Constantinople. At the same time, after three centuries of repression and persecution, Christianity became the popular religion under the imperial sanction, and the ecclesiastical organization of the Church was officially recognized. One result of this was that Rome acquired the religious primacy of Christendom when her political primacy was lost.

#### Barbarian Irruptions

With the beginning of the 5th century, when the empire was parted into E. and W. under the two sons of Theodosius, the flood-gates of the imperial frontiers burst, and the Teutons swept over the barrier. The Visigoths burst into Italy under Alaric, and moved W. into S. Gaul and Spain, whither they had been preceded by Vandals and Sueves. Behind the Goths came a more terrible conqueror, Attila and his Huns, not Teutons, but Tartar hordes who for two generations had been moving across S. Russia from Central Asia. The Goths in the W. had chosen to profess allegiance to the empire; they helped the imperial armies to turn back the Huns at the battle of Châlons, 451.

The dispersal of the Huns made way for fresh Teutonic irruptions. The Ostrogoths, after overrunning much of the Balkan peninsula, turned W. and established a new Gothic dominion in Italy under Theodoric, who called himself a lieutenant of the single emperor now reigning at Constantinople. Then at the beginning of the 6th century the Teutonic Franks swept over the Rhine and made themselves masters of the land which still bears their name, though the Franks themselves never completely Teutonised the country,

which remained persistently Latin. At the same time the native customs of the Franks in France, as of the Goths in Spain, fusing with the established Latin system, produced the social and political system known as feudalism. Other Teutonic tribes followed; Burgundians into the Rhône valley, and Lombards into the Lombard plain. The latter established their lordship over most of Italy, the Ostrogoths having been extirpated by the generals of Justinian, whose successors failed to retain the domination of the E. over the W. But nowhere did the Teutons effectually Teutonise populations already Latinised. Italy, France, and Spain remained essentially Latin, though Latinism hardly expanded E. of the Rhine or N. of the Danube.

With the rise of Mahomedanism in the 7th century, Europe was once more threatened with Orientalism. Early in the 8th century the Moors invaded Spain and drove the Christians into its N. corners. But when they flooded over the Pyrenees, their armies were shattered by Charles Martel at the battle of Tours or Poitiers, 732, and the tide was rolled back for ever behind the Pyrenees, though Saracen sea-rovers established a footing in Sicily. In the E. the Mahomedan onslaught had been hurled back 14 years before by the emperor Leo the Isaurian under the walls of Constantinople. Except in the S. of Italy all semblance of control by the emperor at Constantinople vanished from W. Europe.

#### The Empire of Charlemagne

Charlemagne now revived the W. Empire. He crossed the Pyrenees and drove the Moors S. of the Ebro. He completed his father's work of crushing the Lombards in Italy. His armies smote the heathen Saxons in the N. and the Bavarians in the S., and compelled them to adopt Christianity; still pushing E., they shattered the Mongolian kingdom of the Avars in Hungary. At the instance of the pope, Charles was crowned emperor in Rome on Christmas Day, 800. When he died in 814, the Elbe and the Adriatic were approximately the E. boundaries of the new Holy Roman Empire which he had created. The Danube still remained in effect the N. boundary of the Byzantine empire.

Under the grandsons of Charlemagne his empire parted into three domains, the W., which shaped itself into the kingdom of France, the E., which was German, and the intermediate, "middle," or Burgundian, which stretched from the North Sea to the Gulf of Lions, and

included most of Italy, the S. of which, however, still belonged to the E. Empire. The crown of the Holy Roman Empire generally went with the E. or German kingdom. Burgundy broke up, part going with France and part with Germany, but never with a definite bond, while Italy became a congeries of dukedoms and counties over which the emperor on the other side of the Alps could exercise little authority. When the house of Charlemagne died out in Germany, the crown of the German kingdom, of the Holy Roman Empire, passed by election to the dukes of Saxony. The first, Henry the Fowler, was never crowned emperor; but he and his son, Otto the Great, stemmed the onrush of the third Mongolian horde which occupied Hungary, the Magyars, who nevertheless retained permanent possession of that tract.

#### The Middle Ages

The close of the 10th century, then, is the era of transition from the chaos of the earlier Middle Ages to what is generally more distinctively meant by the medieval period. During the 9th and 10th centuries the sea-rovers from Scandinavia had planted their colonies of Danes or Northmen in the British Isles and in the N. of France, and had shaped their own kingdoms in Norway, Denmark, and Sweden. In the 5th and 6th centuries the Teutonic English had conquered more than half the island of Britain, and in the 10th century England had become a fairly consolidated state.

France was on the way to consolidation under the house of Capet, which had displaced that of Charlemagne, but as yet the king of France was little more than a premier baron amongst many, some of whom ruled wider domains than the king himself. Spain was still mostly under the Saracen sway, though the Christian princes were soon to emerge from their northern fastnesses to win it back, establishing the kingdoms of Castile and Leon, Portugal, Aragon, and Navarre.

In the Spanish kingdoms, as in France, the king was hardly more than a premier baron. Central Europe regarded the German king as its head, though scarcely as its ruler, while to W. Christendom, in his character of emperor, he represented the idea of Christendom as a unity. The popes, as spiritual heads of Christendom, now began gradually to claim an authority higher than that of any lay potentate. Outside the empire on the E. the Slavs were establishing the Polish and Bohemian king-

doms, and had already given half the Balkan peninsula and the whole Danube basin a Slavonic character, though they owned the supremacy of the emperor at Byzantium. The latter, with his hardly held dominion in Asia, barred the door into E. Europe against the Mahomedans.

The new age was the age of feudalism, which before the end of the 11th century had established itself everywhere. Theoretically, the king owned every inch of soil in his kingdom. He had granted great tracts or small to his servants on condition of military service. They in turn had granted portions upon like conditions, while every one had settled husbandmen upon the soil, allowing them patches on condition of agricultural and other services to the lord.

But outside England, the tenant generally owed his services to his immediate lord and was bound to fight for him against anyone else, even the king. Hence if one of the king's men or barons accumulated enough territory, he had at his back an army of tenants with which he could levy war against the king. The royal authority depended upon the loyalty to the king of a proportion of the baronage. Thus the French dynasty and each German dynasty tried to expand the crown estates at the expense of the great barons. In France the counts of Anjou acquired by marriage the dukedoms of Normandy and Aquitaine as well as the independent kingdom of England. Essentially the Hundred Years' War between England and France in the 14th and 15th centuries was a struggle between the crown and the duke of Aquitaine, who happened also to be king of England. The final victory of the French crown, and its absorption of the duke's dominions, cleared the way for the final establishment of an absolute monarchy in France.

#### Pope and Emperor

In Germany, on the other hand, the monarchy was elective; each time that the succession changed, the new dynasty had to start afresh the absorption of feudatory territory, and consequently the German kings failed to establish absolute monarchy. Germany remained an aggregation of estates great and small, over which the emperor exercised little control.

The papacy again established its own supreme authority over the whole ecclesiastical organization of W. Christendom, and sought to assert that authority over all lay potentates. Within the empire, in Germany and in Italy, the struggle between the pope as the spiritual head of Christendom, and the

emperor as its temporal head, helped the baronage to maintain their independence, since they could support emperor or pope as best suited themselves.

Europe, then, in the second as in the first half of the Middle Ages, shows nothing like a system of organized states. Through the Scots' War of Independence and the Hundred Years' War between England and France, the defined kingdoms of England, Scotland, and France were consolidating themselves during the four centuries which followed the Norman conquest of England in 1066. Spain grew into a group of four separate kingdoms, the Moorish kingdom of Granada in the S., and the kingdoms of Portugal, Castile, and Aragon, to the last of which Sicily was attached in 1282. Central Europe—Germany—was only a loose confederation of states in a state of perpetual flux.

Italy became practically a collection of city states, in which there was developed an intellectual life far in advance of that of the rest of the world, especially during the 14th and 15th centuries. On the N. of the empire lay the Scandinavian kingdoms; to the E. of it Poland, Bohemia, which had a connexion with the empire, and Hungary. S. of Hungary chaos for the most part reigned on the Balkan peninsula, though Byzantium held back the Asiatic invaders till its fall

in 1453, when a Turkish dominion was established in the European continent E. of Poland. The development of a Russian empire was prevented by the great Tartar incursion in the 14th century; but by the end of the 15th the Muscovite kingdom was shaping itself.

The latter half of the 15th century marks the transition from medieval to modern Europe. The union of the crowns of Castile and Aragon by the marriage of Ferdinand and Isabella, 1469, unified the Spanish monarchy. The imperial crown had passed to the Hapsburg, Frederick III of Austria, in whose dynasty it became hereditary. The use of gunpowder was to revolutionise warfare. The voyages of Christopher Columbus and Vasco da Gama opened the ocean pathway to a new world in the W. and to the

E., hitherto cut off from Europe by the Muslim wall which the crusaders had failed to break through. The intellectual revival in Italy received a new impulse from the revived study of ancient literatures following upon the fall of Constantinople and the dispersion

of Greek scholars in the W. Men were beginning to challenge the doctrines of the Church itself.

With the 16th century the history of Europe becomes international, as never before. The struggle of individual states for general European ascendancy now begins, and against this effort the common interest in the preservation of a balance of power makes itself felt. Across this for 150 years cuts the religious struggle between Protestantism and Romanism, and this again is crossed by the struggle for dominion over colonial lands.

Europe. In the 8th and 9th centuries the supreme historical event was the substitution of the Holy Roman for the Eastern Roman Empire as the predominant power; as established by Charlemagne it comprised Gallo-Latin Neustria, Teutonic Austrasia, and Lombard Italy. In Spain the Omniad emirate was set up by Abd-ur-Rahman. In the Near East, Bulgarian and Serbian kingdoms were coming into existence. Islam controlled Africa and western Asia, except Asia Minor

The accident of marriages conveyed to one man, Charles V, the entire Spanish inheritance, including Sicily, S Italy or Naples, the Netherlands, and the whole Hapsburg territorial inheritance in Germany, while he also succeeded his grandfather as emperor in 1519. A year later the floodgates of the Reformation were opened by Luther's defiance of the papacy. The German inheritance of the Hapsburgs was transferred to Charles's brother Ferdinand, who acquired for his own house the crowns of Hungary and Bohemia, and the Hapsburg monarchies became the barrier between Europe and the Turks. During Charles's reign Protestantism was established in Scandinavia, over the N. half of Germany, and in the N. half of the Netherlands; while it was planted as yet insecurely in England, Scotland, and France.

#### Religion and Politics

When Charles died in 1558 his son Philip II was ruling over the Spanish dominions and the Netherlands, Ferdinand was emperor, and a truce had been confirmed between the Protestant and Catholic states of the empire. By the end of the century Philip had virtually lost the N. Netherlands, which became the United Provinces of the Dutch Republic, while the Catholic S. still remained the Spanish Netherlands. England and Scotland had both become definitely Protestant, soon to be united under one crown; while France remained Catholic, with freedom of worship secured to the Protestants, and her foreign policy directed by purely political considerations irrespective of religion. Maritime ascendancy, once enjoyed by Italian city states had first passed from them to Portugal and Spain, but was now decisively transferred to England and the Dutch states.

The struggle of the religions was fought out in the Thirty Years' War (1618-48), the emperor himself championing the Catholics, while Gustavus Adolphus of Sweden intervened on behalf of Protestantism. Its outcome left the division between Catholic and Protestant states in Germany very much where it had been at the beginning. It also broke the last attempt to establish an effective central control of the empire in the hands of the emperor. And meanwhile Spain had become practically a secondary power, while France, by Richelieu's policy, had developed a strong central government.

In the next phase, Louis XIV of France, a monarch whose abso-

lutism in his own country was almost unqualified, sought through a long series of wars, 1667-1713, to enlarge the borders of France and to make her the dictator of Europe. For 40 years the main resistance came from Spain and Austria, and from the little Dutch state under William of Orange, whose accession to the thrones of England and Scotland brought Great Britain into the European struggle, of which the last phase at this stage was the War of the Spanish Succession (1702-13). That war gave Spain herself to a Bourbon, Philip, a grandson of Louis, who was himself succeeded on the throne of France by his great grandson Louis XV. It also transferred the Spanish Netherlands to Austria, together with the Two Sicilies.

Meanwhile within Germany the electorate of Brandenburg had been erected into the kingdom of Prussia (1701); and outside, England and Scotland had been incorporated in the kingdom of Great Britain (1707), while in the E. Russia had at last been organized into a consolidated dominion by Peter the Great, and Sweden, under Charles XII, had made her last effort to retain among the European powers the position won for her by Gustavus Adolphus. Britain had now emerged as the supreme maritime power, and established naval bases at Gibraltar and Minorca. The reign of Louis XV in France (1713-74) covers an era of protracted European struggles. The last aggressive effort of Turkey was crushed in 1718; Russia established herself on the Baltic and the Black Sea, and extended her boundaries eastwards.

#### Prussia and Silesia

The War of the Polish Succession (1733-38) set up a Bourbon dynasty in the Sicilies. The War of the Austrian Succession (1740-48) saved the Austrian dominion from disintegration, except for the annexation of Silesia by Frederick II of Prussia—a robbery which led the way to a regrouping of the powers in the Seven Years' War (1756-63). Great Britain, the former ally of Austria, now supported Prussia, which had to defend itself against the French on the W., the Austrians on the S., and the Russians on the E. Great Britain's part in the war was mainly on the seas and beyond them, where she fought the French in America and in India, and in effect turned them out of both. In Europe, the war confirmed Prussia as a first-class power, still in possession of Silesia; but no fighting was needed when, in 1772, the tsarina

Catherine arranged with Frederick of Prussia and with Austria the first partition of Poland, a partition carried farther in 1793 and 1795, when the whole of Poland was absorbed by one or other of the three.

The development of the last 300 years had established despotic governments in every state in the European continent, large or small, with the exception of Switzerland and Holland. The despots were generally well disposed towards their subjects. Many tried to improve the conditions of their people, and some succeeded. But, broadly speaking, most of the populations lived actually or approximately in serfdom. Political liberty was non-existent, and between the classes there was an almost impenetrable social barrier, while the burdens of taxation and service pressed most heavily upon those least capable of supporting them.

#### The French Revolution

The summoning of a popular assembly in France—the states-general of 1789—in the hope of discovering a panacea for the imminent financial ruin of the country, proved to be the first step in a wide revolution. Successive assemblies passed from advocating the abolition of privileges to demanding the abolition of the privileged. The extremists captured the control of the government, first emasculated and then wiped out the monarchy, and went on to proclaim themselves the liberators of Europe from the tyranny of monarchs and aristocrats.

Great Britain, whose constitutionalism had been the model of the reformers before they were swept away by the revolutionary tide, was swung into the vortex when the new republic tore up treaties, and set about annexing the Austrian Netherlands in 1793. Long before the terrors of the revolution within France had exhausted themselves, the armies of the republic, reckless of established methods, were facing and routing the orthodox armies of the monarchies. Prussia and Spain soon retired from the struggle; Bonaparte's Italian campaigns broke Austria. Bonaparte betook himself to Egypt; Britain, fighting on alone, won the mastery of the Mediterranean; Austria returned to the attack, supported by Russia. The return of Bonaparte and his establishment as First Consul of France was followed by the shattering of the new coalition, and even by the accession of Great Britain to the peace of Amiens, 1802.

In 1803 the Franco-British duel was renewed; two years later a new coalition was formed. Nelson

sealed the naval supremacy of Great Britain at Trafalgar, 1805, but Napoleon, now emperor of the French, shattered the new coalition at Austerlitz. Prussia, aroused at last, took up the challenge and was crushed at Jena, 1806, and Napoleon made his peace with Russia at Tilsit in 1807, and set about the reconstruction of Europe according to his own fancy. His attempt to appropriate the Spanish peninsula brought Great Britain into the war for the first time as a military power, 1808. For five years Napoleon's generals strove in vain to drive the British into the sea. But Napoleon quarrelled with the tsar, and his Moscow expedition in 1812 ended in irretrievable disaster. The uprising of the peoples rather than of the governments overwhelmed him, he was compelled to abdicate in 1814, and though he reappeared to make a last bid for victory, he was finally crushed at Waterloo, 1815.

The congress of Vienna restored the map of Europe so that the state boundaries were much as they had been in 1792, except that the Netherlands were formed into a new kingdom. The old dynasties were replaced and the old despotisms renewed, the former states of the empire forming the German Confederation. But the French Revolution had kindled new ideas of liberty, partly democratic, partly nationalist, and despite the efforts of Metternich, those movements could not be crushed. Greece broke free from her subjection to Turkey; France turned out the Bourbons and established the constitutional Orleans monarchy in 1830. The S. Netherlands separated from Holland in 1839 and became the Belgian kingdom. Liberals and reactionaries did battle in Spain and Portugal.

#### Austria and the German Confederation

Then in 1848 came the Year of Revolutions. In almost every country, nationalist, constitutional, or democratic movements came to a head. Generally, though not always, the Reaction was for the time victorious. France made herself into a republic, but in five years the nephew of Napoleon had turned the republic into the Second Empire. Limited constitutions were conceded in sundry German states. Austria kept her grip on the diverse portions of her empire, and though the title of the Holy Roman Empire had been dropped since 1806, she still retained her place as leader, or as joint leader with Prussia, of the German confederation. The mutual jealousies and distrust between Great Britain and Russia, the causes of which

were more Asiatic than European, were a constant disturbing factor in European affairs.

The three great movements afoot were towards the liberation of the Balkan peninsula from Turkish rule, towards the unification of Italy, and towards the unification of Germany under the headship of Prussia. The rising of N. Italy under the leadership of Victor Emmanuel, king of Sardinia, supported by Napoleon III, in 1859, liberated most of N. Italy from Austria and from the temporal control of the papacy and created the kingdom of N. Italy. The revolt of Sicily and Naples against the Bourbon dynasty in 1860 was followed by the adhesion of S. Italy to the N. kingdom, and in 1861 the united kingdom of Italy was established, though Austria still held the N.E. corner and Rome still belonged to the pope. In 1871, however, it was united to the new kingdom of which it was made the capital.

#### Policy of Bismarck

Bismarck organized the Prussian military power, contrived the annexation of Slesvig and Holstein from Denmark, and procured the Seven Weeks' War with Austria in 1866, which in effect ejected Austria from the German confederation and gave Prussia decisive ascendancy therein. Incidentally, Italy was rewarded for her assistance to Bismarck by the acquisition of Venetia. Bismarck's policy achieved its triumph with the Franco-Prussian War of 1870-71. The recovery of the Rhine provinces from France was accompanied by the recognition of the king of Prussia as German emperor and by the consolidation of the new German Empire under Prussian direction, with a machinery which, for the first time in Germany's history, brought her under a single control and made her the first military power in Europe. Another outcome of the war was the establishment of the third republic in France.

Turkish misrule was the excuse or justification of the wars with Turkey upon which Russia entered in 1853 and 1877. In both, British intervention was responsible for the preservation of Turkey, but those wars brought about the virtual independence, first of Rumania and then of the Slav states of Bulgaria, Serbia, and Montenegro, while Bosnia and Herzegovina were placed under Austrian administration, paving the way for annexation after an interval of 30 years. The outstanding features, however, of the European situation in the latter years of the 19th

century were the alliance of the three emperors, and the substitution for it of the alliance of the three powers, Germany, Austria-Hungary, and Italy, which was answered by the alliance between France and Russia. The settlement of outstanding differences between Great Britain and France in 1905 prepared the way for the Triple Entente between Great Britain, France, and Russia, which became an accomplished fact in 1907, while its solidarity was proved to the great dissatisfaction of Germany in 1911 by the British support of the French in connexion with the Agadir incident. The Balkan Wars of 1912-13 liberated the Balkan States from the last relics of Turkish sovereignty, but failed to establish a concord among them, whereof the fruits were later to become apparent.

Two more events prior to 1914 have here to be noted. In the 15th century Denmark, Norway, and Sweden had been united under one crown; in the 16th Sweden had separated herself, but Norway had remained attached to Denmark. At the European reconstruction in 1815 Norway had been taken from Denmark and attached to Sweden. The union, however, had never been harmonious or satisfactory to Norway, and in 1905 she procured her establishment as a separate kingdom. In 1908 a revolution in Portugal expelled the dynasty and inaugurated a republic.

#### The Climax of Power Politics

The causes, campaigns, and conclusion of the most devastating war in history up to that time—it lasted from July 28, 1914, to Nov. 11, 1918—are described under First Great War. The chief protagonists at the start were the central powers, Austria-Hungary and Germany, against Russia and France. Great Britain immediately joined the latter group, among which were Serbia and Belgium as victims of attack; Turkey threw in her lot with the central powers, as later did Bulgaria; in 1915 Italy broke with her allies and joined the Entente Powers; by 1917 the German submarine campaign had brought the U.S.A. into the war. That year Russia collapsed in two internal revolutions; and another year was needed to defeat the central powers, the first break coming in Bulgaria and Turkey. Peace making occupied most of 1919-20 (see St. Germain-en-Laye, Treaty of, and Versailles, Treaty of). Czecho-Slovakia and Yugoslavia appeared as new states; Poland was resurrected; Finland, Estonia, Latvia, and

Lithuania gained independence through the disintegration of the old Russian Empire.

#### A. D. Innes

The treaty of Versailles, signed in the hall of mirrors on June 28, 1919, was followed at brief intervals by treaties with Austria, Hungary, Bulgaria, and Turkey which registered the overwhelming victory of the Allies over the central powers and their satellites in the First Great War. Like all dictated settlements, they were bitterly resented by the defeated parties. The new frontiers and the limitations imposed on the sovereignty of the five states could be maintained only so long as the unity of the victors was preserved. This condition, however, was not fulfilled. The senate of the United States, reverting to its traditional isolationism, declined to approve the treaty of Versailles (which included the covenant of the League of Nations) without reservations which President Woodrow Wilson felt unable to accept.

This damaging blow at the new order was followed by a rift in the *entente cordiale* (q.v.). After vetoing the French claim to sever the whole of German territory W. of the Rhine from the new Reich, Great Britain and the United States offered France a promise of military support in the event of renewed German aggression. The guarantee enshrined in the tripartite treaty of June 28, 1919, however, was joint, not separate, and when the American senate repudiated the signature of the president, the obligation on Great Britain lapsed. Possessing neither the coveted territory nor the Anglo-American guarantee, France felt a legitimate grievance.

#### French Occupation of the Ruhr

Negotiations in 1921-22 for a British guarantee, initiated by Briand, broke down primarily because the Lloyd George government refused a long-term commitment. Henceforth France felt that she must look after herself. She concluded an alliance with Poland, and Poincaré's decision to occupy the Ruhr in Jan. 1923, on the ground that German reparations were in arrears, destroyed what little vitality was left in the *entente cordiale*. Convinced that France's step was legally unjustifiable, the British and American governments withdrew their troops from the Rhineland. The economic results of the occupation of the Ruhr strengthened Anglo-American disapproval, for the mark lost all value and the industrial

recovery of Germany was blocked. Great Britain and France agreed that Germany should remain permanently disarmed; but while the former desired her economic rehabilitation in the interest of European prosperity, France believed that to render her harmless it was necessary to keep her poor. When Stresemann called off the passive resistance of the Ruhr in the autumn of 1923, and a commission under C. G. Dawes (q.v.) was appointed to examine afresh the reparations problem, Poincaré congratulated himself on the success of his policy. Yet his position was not so strong as he believed. Italy, ruled by Mussolini since 1922, was with him, but her share in the Ruhr adventure was small. In May, 1924 the French chamber elected in 1920 came automatically to an end, a majority of the left was returned, and new pilots set out on a fresh course.

#### Treaty of Locarno

For the next six years, the dark clouds which had overhung Europe seemed to be melting away. A temporary limitation of naval armaments had been arranged at the Washington conference in 1922. The new French government, with Herriot at the head, believed with Briand that Frenchmen "must learn to speak European." The French troops were withdrawn from the Ruhr, a new and stable currency was introduced in Germany, and the economic recovery of Europe proceeded apace. In 1925 Stresemann, the German foreign minister, informed Paris and London that he was willing to recognize the *status quo* on Germany's W. frontiers, in other words, to surrender all claim to Alsace and Lorraine. After months of negotiation the territorial stabilisation of the west was registered in the treaty of Locarno, the joint work of Stresemann, Briand, and Austen Chamberlain, with the assistance of Lord D'Abernon, British ambassador in Berlin. Great Britain and Italy pledged themselves to resist attack on the Franco-German and Belgo-German frontier, whether it came from Germany or France. A similar renunciation of claims to revise the new German-Polish frontier, strongly urged by France and Poland, was refused by Stresemann, though he promised not to attempt a change by arms. British opinion approved both the undertaking to fight for the *status quo* in the west and the refusal of a similar

obligation in the east. A year later, in Sept., 1926, Germany joined the League of Nations with a permanent seat on the council. Of the five great powers of Europe, only Russia was absent, and the prestige of the League increased from year to year. When the assembly met every year in Sept., all eyes were turned to Geneva, where Lord Cecil, Nansen, and other "good Europeans" laboured zealously for an organized world.

#### Kellogg Pact of 1928

The next milestone on the road to peace was the signature of the pact of Paris, popularly known as the Kellogg pact, on Aug. 27, 1928. In 1927, on the tenth anniversary of the entry of the United States into war, Briand proposed to the American people a mutual engagement to outlaw war for a hundred years. Since a conflict between such old friends was unlikely, the American secretary of state proposed that all states should pledge themselves to renounce war, not merely for a century but for ever. The American project was accepted without enthusiasm by the French, who resented the absence of military sanctions. Their apprehensions were diminished by Kellogg's formal declaration that the signatories were not debarred from the right to defend themselves against unprovoked attack, and that violation of the pact would automatically release the other parties from all obligations to the treaty-breaking state. Since belligerents almost always assert that they are fighting in self-defence, the reservation reduced the renunciation of war to an empty phrase. Moreover, the British government reserved liberty of action in "certain regions the welfare and integrity of which constitute a special and vital interest for our peace and safety." The reference to Egypt was clear enough. If ever an international agreement deserved the name of a scrap of paper, it was the pact of Paris, signed though it was by most states in the world.

In the same year, 1928, the League assembly approved a general act for the peaceful settlement of international disputes, providing for conciliation in cases unsuited to the Hague Court. Though Great Britain acceded to the general act only in 1931, the MacDonald government decided in 1929 to sign the optional clause of the statute creating the permanent court of international

justice at the Hague. A few countries including France had already signed this, but had not ratified their signatures. Though important cases had been referred to the court with satisfactory results, only states which voluntarily accepted its verdicts in advance were under any compulsion to make use of it. Other states, large and small, now came trooping in. The British government, however, made an important reservation by excluding domestic and inter-Imperial questions. A further effort to organize peace—Briand's scheme for a European federation outlined at the League assembly in 1930—met with little approval and was dropped.

Two more indications of the general desire to reintegrate Germany into the life of Europe occurred during these years of hope. The Dawes plan for the payment of German reparations was superseded in 1929 by the Young plan, reducing the burden and creating the bank of International Settlements (*q.v.*) at Basel; and the last armies of occupation evacuated the Rhineland in the summer of 1930, five years before the date fixed at Versailles. The most unsatisfactory feature in the European landscape was the exclusion of Russia from the European family.

A third chapter opens with the Reichstag elections in September, 1930, when the Nazi deputies jumped from 12 (elected in 1928) to 107 (out of 475). The main cause was the impact of the American economic blizzard of 1929 which raised the figures of German unemployment to seven millions. Stormy weather was obviously ahead, and two of the most experienced pilots had been removed in 1929, Stresemann by death, Austen Chamberlain by a change of government. Only Briand remained, the ghost of his former self. Brüning possessed no stable majority. Everything combined to favour treaty-breaking and aggression.

#### Blows at the League

The first blow was struck in 1931 when Japanese troops seized Manchuria from the powerless hands of the Nanking government. The League of Nations expelled the offender, but no state cared to risk war by imposing economic sanctions. A second blow was the fiasco of the disarmament conference which met at Geneva in 1932. A third fell when Hitler as the leader of the largest party in the Reichstag became chancellor

on Jan. 30, 1933, resigned from the League, and solved the problem of unemployment by wholesale rearmament. In March, 1935 he announced the return to conscription, and Goering revealed that Germany possessed a formidable air force. More galling fetters were struck off in March, 1936, when German troops marched into the demilitarised zone of the Rhineland. Though this *coup* violated not only the dictated treaty of Versailles but also the freely negotiated Locarno pact, no action was taken by Great Britain or France, where the dread of another war outweighed the promptings of self-preservation. Here was the turning point in post-war history, since a stout wall in the west would enable Hitler to strike out in central and eastern Europe. Though Baldwin declared that her frontier was now on the Rhine, Great Britain had returned to her old system of a small voluntary army, and France lacked vigorous leadership. Foch, Clemenceau, and Poincaré were gone; weak coalitions rose and fell; the generals trusted to the Maginot line; and the output of munitions and armaments was small.

#### Mussolini Invades Abyssinia

The Versailles system, resting first on the political cooperation of Great Britain, France, and Italy, and secondly on the military predominance of France on the Continent, ended in 1935, when Hitler broke Germany's military chains and Mussolini invaded Abyssinia. Though Italy had been on the winning side in the First World War, she was disappointed with her share of the spoils, and thirst for colonial territory proved stronger than loyalty to her late allies. The crime was frowned on by the League but no effective action was taken. Before dispatching troops, munitions and poison gas through the Suez Canal, Mussolini (in an interview with Laval) assured himself that France would not make any difficulties; and the Baldwin-MacDonald cabinet, fearful of driving him into the German camp and disinclined to risk the Mediterranean fleet in vindicating the authority of the League, played for safety. The policy of limited economic sanctions, while failing to prevent the conquest of an unarmed and primitive community, angered the Italian people and made them look round for new friends. The dictators now grasped each other's hands. Visits were

exchanged, the Axis came into being, and effective Italian and German aid was rendered to Franco's rebellion in Spain. The adhesion of Japan created what Hitler called the world-triangle. Three of the seven Great Powers were now banded together for aggression, which the other four were too disunited to check. The United States had left the stage. Russia, though she had joined the League in 1934, was sundered from the western powers by old suspicions and ideological differences. France, racked by party strife, was unready for another major struggle. Britain was weakened by sharp antagonism between the supporters of Neville Chamberlain's policy of appeasement and the partisans of rapid rearmament led by Churchill, who foretold war with Germany.

#### The Axis in Action

In March, 1938, Hitler seized Austria without opposition. The autocratic Schuschnigg regime undermined by the Austrian Nazis and detested by the Socialists whose power had been broken by Dollfuss, collapsed like a house of cards, and Mussolini forgot his old pledge to stand by Austria to the end. Czechoslovakia, now vulnerable from the south as well as from the north and west, was the next victim on the list. Using the grievances of the Sudeten Germans as a pretext, Hitler secured the consent of Daladier and Neville Chamberlain at Munich in Sept., 1938, to the partial occupation of the country, though France was an ally and Great Britain had encouraged hopes of support if Germany attacked. Russia, though also an ally, was not invited to the Munich conference. Less than six months later, in March, 1939, President Hacha, the successor of Benes, who resigned after Munich, was summoned to Berlin and compelled by the threat of the immediate bombing of Prague to surrender the rest of his country.

#### Hitler Turns on Poland

Hitler now turned to the third item on his agenda of aggression. The denunciation of his ten years' pact of non-aggression with Poland concluded in 1934, followed by the customary vilification of the prospective victim, revealed where the next blow would fall. Hoping to avert it, Great Britain promised support in the event of an unprovoked German attack; and with France made proposals to Russia for the organization of mutual defence against aggression. But

Russian suspicions of the western powers were deep-seated, and the negotiations came to an abrupt end with the announcement on Aug. 24, 1939, that Germany and Russia had the previous day signed a ten-years' mutual non-aggression pact.

Despite categorical declarations that Great Britain would stand by her new ally, and despite the existence of a Franco-Polish defensive alliance, German troops crossed the 1,200-mile long Polish frontier from the north, west, and south on Sept. 1, 1939. On the 17th, Russia marched in from the east, Warsaw, after ruthless bombing, fell on the 27th, and the Polish republic ceased to exist.

The winter of 1939 was spent by Hitler in preparations for the attack in the west, which was launched in April, 1940. Denmark offered no resistance, and, despite British assistance, Norway was conquered without much difficulty. In May, 1940, Hitler invaded the Low Countries. The small Netherlands army surrendered on May 14 after four days, the Belgian on the 28th. The bulk of Great Britain's expeditionary force of some 250,000 men, surrounded at Dunkirk, was evacuated safely between May 26 and June 3, but was obliged to leave its equipment behind. The French government, paralysed by defeatism, German intrigues, and a stab in the back by Italy, signed an armistice on June 22.

#### Britain Stands Alone

Hitler assumed that he had won the war and that the air attack he launched on southern England in Aug. would clear the way for invasion. But months of bombing of British cities failed to break the spirit of the people.

For a year the British Empire stood alone. Hitler's attack on Russia in June, 1941, provided it with a new ally. In Dec. of the same year Japan's treacherous attack on Pearl Harbour in the Hawaiian Is. brought in the U.S.A. The campaigns affecting Europe which followed are described under Europe, Liberation of Western; North Africa Campaigns; Russo-German Campaigns, etc.

When the Allies crossed to Sicily and South Italy, Mussolini was overthrown by his old colleagues, Marshal Badoglio and the king, and Italy changed sides. France was invaded from the north and south, and, while Russia pressed forward to capture Berlin, the British, American, and French armies advanced to cross the

Rhine. The Germans fought stubbornly, but they were outnumbered, and their industrial cities and communications had been largely destroyed by attacks from the air. The suicide of Hitler and Goebbels in the air raid shelter under the chancellery in Berlin was followed by unconditional surrender of the German armed forces. The end of the fighting in the greatest war she had experienced was, so far as Europe was concerned, celebrated on VE day, May 8, 1945. The Third Reich, which its rulers boasted would last a thousand years, had disappeared in twelve, and its

place as the strongest power on the Continent had been taken by Russia. A new era had begun.

## EUROPE, WESTERN: ITS LIBERATION

Cyril Falls, Chichele Professor of Military History, Oxford

*Under this heading is given a general picture of the Allied campaign in the West, June 1944, to May, 1945. For fuller accounts of parts of the campaign, see Belgium; France; Netherlands. See also Arnhem; Casualties; D-day; Mulberry Harbour; Pluto; Radar; Russo-German Campaigns, 1941-45, etc. The war as a whole is treated under Second Great War*

Having decided, as they did at an early stage, that Germany could not be defeated without a landing on the west coast of France, the Allied combined chiefs of staff found themselves faced by the stiffest problem they had to overcome: that of establishing a secure foothold upon a fortified continent. Later stages of the attack would be difficult, but this was the most difficult of all.

In Feb., 1944, the enemy had 53 divisions in the west under the supreme command of F.-M. von Rundstedt; by June 3, his forces in France and the Low Countries had been increased to 60 divisions—10 panzer and 50 infantry. Half that strength, if it could concentrate quickly, would have been more than enough to drive any landing force back into the sea. The secure foothold had to be established before that could happen. This called for very careful study of the speed with which the enemy could concentrate and of the means of delaying him, such as attacks on his communications and feints leading him to believe that another landing was about to follow.

Allied preparations affected the whole life of Great Britain. Reserve stores for civilian consumption were accumulated because the bulk of the available shipping was temporarily taken over for the transport of the invading armies. The quartering, training, and movement of the vast forces involved was in itself a gigantic task. A simultaneous landing in the south of France,

and combined operations to secure Rangoon and liberate Burma in the only way it could have been done quickly, were ruthlessly set aside because there was a shortage of landing-craft. Operation "Overlord," as the landing in N. France was called, took priority because everything depended on its success.

A large amount of special equipment had been prepared to expedite the build-up and the breakthrough after the first landing. The outstanding examples were the material for the two artificial "Mulberry harbours" and for the petrol pipe-line laid under the sea (see Pluto). It also included special weapons known as petards for the destruction of concrete, flame-throwing tanks, mine-sweeping tanks, amphibious tanks and troop-carriers. Three airborne divisions were to be dropped, two at the base of the Cotentin peninsula to isolate Cherbourg, and the third to seize the crossings of the Caen canal to the E. of the Seine Bay.

The bay of the Seine was chosen for the landings because it came nearest to fulfilling the conditions sought. It afforded shelter and at the same time was less heavily defended than other areas with good beaches farther north, while it satisfied the requirements of the strategists and tacticians of the Allied air forces.

The assault was preceded by a heavy air offensive. This was directed against many targets, but chiefly synthetic oil plants and communications, including

Liberation of W. Europe. This map indicates the general lines of advance of the Allied armies after the landings in Normandy, June 6, 1944, and on the S. coast of France, Aug. 15, up to the date of junction of the two forces near Sombernon, Sept. 11. Shaded areas remained in enemy hands, the La Rochelle enclave until late April, 1945, the others until after the German surrender in May

rolling stock. A system of shuttle-bombing between the U.K. and the Mediterranean and later between Italy and Russia was developed. By the day of invasion, 74 bridges and tunnels leading to the battle area were impassable; and Germany's oil production had been reduced to about 30 p.c. of its normal capacity.

The invasion began on June 6, 1944. The airborne forces were dropped first. Then the great fleet of landing craft discharged their loads of troops and material on the beaches of Normandy. Air opposition was virtually nil, thanks largely to the Germans' lack of petrol. The original landing parties consisted of five divisions—two British, one Canadian, and

two American—apart from the airborne divisions and some special troops. The operations were conducted by the British commander, Gen. Sir B. L. Montgomery, to whom this responsibility had been delegated by the supreme allied commander, Gen. Dwight D. Eisenhower. There was some stiff fighting, but the measures taken to overcome the beach defences proved effective.

By June 12, all the lodgements had been linked together. A heavy storm caused delay and serious anxiety, but the supply of material and food put ashore was adequate, and Montgomery's plan quickly began to develop. It was, in brief, for the American forces to secure Cherbourg and make a great right-

wheel till they were facing eastward in the direction of Paris. Half-way through this wheel they were to detach a powerful force to overrun Brittany. Meanwhile the British forces were to attract to themselves the maximum possible German strength in armour and grind it down in unceasing battles.

Cherbourg fell to the U.S. 1st army on June 27. The Germans had not concentrated speedily enough to endanger the rapidly growing landing force, but they had brought no less than six armoured divisions against the British, which was just what Montgomery desired. But the greater hitting-power and lesser vulnerability of the German tanks caused

the British heavy loss at this stage, when the suitability of the country for defence was also to the enemy's advantage. The employment of heavy bombers in direct support on an enormous scale failed to break through the German anti-tank defences. Neither the attempt on Hitler's life on July 20 nor the drastic purge which followed it appeared to affect the fighting in France.

The Allied strength grew with remarkable speed during the battles close to the beaches. Towards the end of July there were established in France 18 U.S. divisions, five of them armoured, and in the British-Canadian army group 15 divisions, five of these, including a Polish division, also armoured. What was equally important was that, in addition to nourishing the heavy battles in progress, the administrative services of the Allies had built up great reserves of essentials—food, petrol, ammunition, bridging material—to support a long advance when the time came.

The American break-out started on July 25. It was brilliantly successful, and Avranches, the gateway to Brittany, was reached six days later. The U.S. 3rd army, which came into existence on Aug. 1 and was commanded by Gen. Patton, thrust west into Brittany, south to cut the neck of the Brittany peninsula, and then, leaving one corps only to reduce the Brittany ports, wheeled eastward. The Germans attempted to swing back their front, but the hinges were knocked away by the British, working from west to east as the American wheel gathered increasing speed.

#### Counter-Offensive Towards Avranches

In Brittany German opposition was negligible, except in the ports, and American armour pushed forward quickly towards Brest. The wheeling wing reached Laval, Mayenne, and Domfront. On Aug. 7 the Canadian 1st army resumed its attack towards the towns of Falaise and Argentan. On the same day the enemy launched his first full-scale counter-offensive, when four armoured divisions and elements of a fifth, with infantry support, struck westward against the Americans with the object of reaching the sea and cutting off all the American forces south of Avranches.

It was a bold stroke and it gained some initial success, but the Americans, well supported by the tactical air forces, then stood

firm. Montgomery had hoped to catch the enemy W. of the Seine; he now saw the chance of doing so, by a British-American junction between Argentan and Falaise. He ordered part of the American force to swing northwards. There was a tremendous fight before, on Aug. 19, the escape route from the pocket thus formed was closed, during which some proportion of the Germans farther west made their way out. But their losses from bombing and artillery fire were enormous.

While that battle went on, other U.S. divisions pressed towards the Seine. On Aug. 20 the head of the U.S. 3rd army reached the river and made a crossing near Mantes. British, Canadian, and U.S. forces overran the "Falaise pocket" and destroyed or captured all the troops remaining in it, and then raced eastward to the Seine.

#### German Losses in Men and Material

The enemy had suffered a terrible defeat. His losses, says Eisenhower, since the campaign began had been enormous. The equivalent of five Panzer and 20 infantry divisions had been destroyed; six other Panzer and 12 other infantry divisions had been severely mauled. By Aug. 25, the Germans had lost 400,000 killed, wounded, or captured, including 200,000 prisoners, 135,000 of whom were taken between July 25 and Aug. 25. They had left 20,000 vehicles, 1,200 tanks, and 2,000 guns on the battlefield. In the face of these results, it seems absurd to speak of disappointment. Yet the fact remains that if 20,000 vehicles were caught, 30,000 crossed the Seine, the greater part of them by the single bridge left standing. The air forces were powerful smashers of towns, including some, like Caen and Lisieux, among the most beautiful in Europe, but they were a relatively clumsy instrument. They could not create a block on the Seine. Had a real block been created on the Seine the war would have been nearly over.

To some, the events which immediately followed made it appear that this was already the case. On crossing the Seine the Allies poured E. and N.E. like a flood. On the right, Patton's 3rd army raced through Reims and Verdun, crossing the Moselle and establishing itself on the E. bank from Nancy to the neighbourhood of Metz by Sept. 11. The U.S. 1st army under Hodges captured Liège on Sept. 8 and reached the German frontier by the 11th. The

British 30th corps, as spearhead of the 21st army group, dashed away across the Somme, reaching Amiens on Aug. 31, Brussels on Sept. 3, and Antwerp on the 4th. Antwerp, one of the world's largest and best-equipped ports, was captured intact, but was of no value to the Allies while the Germans held the Schelde estuary.

During June and July some of the landing craft which had put the Allied armies ashore in Normandy made their way through the Strait of Gibraltar to Italy, to complete the fleet which on Aug. 15 landed on the S. coast of France the first troops of a new army, Gen. Patch's U.S. 7th, which included French troops. Landing W. of Cannes in good weather, the new expedition met but slight resistance. The "build-up" was far more rapid than in Normandy, later landings being unopposed.

While the French captured Toulon and Marseilles, the main body of Americans pressed up the Rhône. A small force also drove almost due N. from the landing places through the mountains to Grenoble, then wheeled into the Rhône valley to cut off the hostile forces fleeing up it. But this force was not strong enough for its task. The Germans had an armoured division, which broke through. The operation then became a pursuit. The Germans had lost heavily in prisoners, but their main body escaped and eventually joined the armies farther N. retreating towards the German frontier. The German forces in the S.W., harried by the French Forces of the Interior, fled north-eastward, but a considerable proportion of them were intercepted. By Sept. 11, when elements of the French 1st armoured division (serving with U.S. 7th army) made contact near Sombornon with the French 2nd armoured division (serving with the U.S. 3rd), the total of prisoners captured on both fronts was 395,000.

#### Eisenhower Assumes Personal Command

On Sept. 1 Eisenhower took over direct command of the Allied army groups in the N.—the 21st (or northern) group, consisting of the British 2nd and Canadian 1st armies under Montgomery, and the 12th (or central) group, consisting of the U.S. 1st, 3rd, and the recently formed 9th armies, under Bradley. On Sept. 15 the forces which had landed in the S. became the 6th (or southern) army group, under Gen. Devers,

Liberation of Western Europe: the Allies' line upon the Rhine. Map showing position of the Allied armies just before the fall of Cologne, March 6, 1945. On the 500-m. front were 21st army group (Canadian 1st, British 2nd, U.S. 9th), F.-M. Montgomery; 12th (Central) group (U.S. 1st and 3rd, Gen. Bradley; 6th (Southern) group (U.S. 7th, French 1st), Gen. Devers

and passed from Gen. Maitland Wilson's command to that of General Eisenhower. Operations were henceforth conducted in accordance with American doctrine, probing for weakness on a broad front, rather than with that associated with the name of Montgomery, concentration on a narrow front for an overwhelming thrust. It must always remain a question for debate whether if the second stage of the invasion had been conducted as it would have been by Montgomery the results would have been quicker. At all events, by the time the Allied armies reached the Maas and the Moselle, they were in a difficult situation from the point of view of supplies, which still had to be landed across the Normandy beaches, whence they had to be carried some 400 miles to reach the most advanced troops. In such circumstances, the wisest course would probably have been to concentrate before all else on opening the deep water port of Antwerp. It was, however, decided instead that Montgomery should make an attempt to jump the river barriers in front of him. His resources would not permit him to do both at once, particularly as the enemy was showing signs of recovering his balance.

Thus was initiated the battle of Arnhem, which began on Sept. 17. The essential feature was the dropping of a "carpet" of airborne troops, U.S. and British, across the successive waterways, the Maas, the Waal, and the Lower Rhine, on the axis of the main road from Eindhoven to Arnhem. Along the corridor thus formed the British 30th corps was to advance and

establish itself north of the Lower Rhine. The crossings of the Maas and Waal were secured, but that over the Lower Rhine at Arnhem had to be abandoned. (See Arnhem.) The advance was broken off, and the 21st army group set about clearing the West Schelde in order to bring the port of Antwerp into use.

The Germans had thrown garrisons tens of thousands strong into

the French ports in order to deny them to the Allies. Not all these garrisons made a strong resistance. Di ppe, which was to prove useful, was taken on Sept. 1, and Le Havre on Sept. 11. Brest held out until Sept. 19, by which time it was so badly damaged and so far from the fighting as to be of small value. The sweep up the Channe  coast, carried out by the Canadians, resulted not only in the capture of

valuable ports but also in the cessation of the bombardment of southern England by flying bombs (*g.v.*). On the capture of Boulogne (Sept. 23), a pipe-line was laid directly to it. Some of the ports, however, held out firmly. Dunkirk did not appear worth attacking, since its value was not likely to justify the losses involved, and its garrison surrendered only on May 11, 1945, after the general surrender. Bordeaux was liberated by the F.F.I. on Aug. 31, 1944, but the Germans held the Gironde estuary until, in April, 1945, the situation on the main front made it possible to send troops of the French 1st army to clear the position.

The opening of the W. Schelde, carried out by Canadian and British troops of the Canadian 1st army in the last week of Oct. and the first of Nov., was one of the most intricate and arduous operations undertaken in the whole course of the campaign. It involved a series of combined attacks by air, water, and land, and much use of amphibious equipment. The most difficult part of it was the capture of the island of Walcheren, most of which had been inundated by the breaching of the dykes by the R.A.F. (Oct. 3 and 7). Losses were heavy because it was seldom that the bombing put out of action the well-protected coast defences, and the Germans kept their guns in action up to the last.

#### Winter Campaign in Alsace

Antwerp was now open, and the railways were to a great extent restored, but this for the time being did not compensate for the bad weather, and for the opportunity to recover afforded to the enemy by the delay. During Nov. and early Dec. the troops laboured in heavy mud against the formidable Siegfried frontier defences. Losses were heavy, especially on the American front. Yet by Dec. 20, the French 1st army on the right had reached the Rhine, clearing Mulhouse on the 22nd; the French 2nd armoured division, still with the U.S. 7th army, entered Strasbourg on the 23rd; the Americans were pushing into the Saar, were beyond the Our (which forms the eastern frontier of Luxemburg), and were E. of Aachen; the British were holding the Maas.

The dispersion of Eisenhower's dispositions resulting from the dispersion of his attacks gave the enemy his chance for a riposte. Rundstedt, restored to supreme command after having been re-

lieved of it in Normandy, had gathered up a reserve, including some divisions from the eastern front. On Dec. 16 he struck on the most thinly held sector of the American front, between Echternach and Monschau. His object was to reach the Meuse, swing N. to take Liège, and penetrate as far as Brussels and Antwerp if all went well. He made use of three armies, two of them Panzer armies largely equipped with new Panther and Tiger tanks.

#### Battle of the Ardennes

The enemy smashed all resistance in his path and thrust deep into the Ardennes, creating a separation of left and right in Bradley's command which led to the placing temporarily under Montgomery of the U.S. 1st and 9th armies. The enemy achieved a maximum advance of over 50 m., but not at the old German speed. He was foiled by the manner in which the Allies covered and contained the flanks of the thrust, by the fine weather after Christmas which gave their air forces full scope, by the dogged resistance of the American troops, and in particular by the defence of the road junction of Bastogne, by the U.S. 101st airborne division, after it had been surrounded. When the Allies struck back he began to pull out again. This he did deliberately, and his rearwards fought so tenaciously that, though large numbers of prisoners were taken, he was never in any risk of being cut off. The denuding of the front in the Palatinate in order to reinforce the southern flank in the Ardennes enabled him to recover more ground here even while his main force was in full retreat, but this was not of the first importance. The battle of the Ardennes was substantially concluded by Jan. 16, 1945, and all remaining losses were soon recovered when the Allies had regrouped. This was the last German counterstroke. It cost the enemy 220,000 casualties and immense losses in tanks, guns, vehicles, aeroplanes, and achieved nothing decisive. It led to Rundstedt's replacement by F.-M. Kesselring—presumably in the hope that he would repeat the defensive success he had achieved in Italy.

Rundstedt had, however, delayed the Allies at least six weeks. They now used their recovery of the initiative to press on to the Rhine. Early in Feb. the Franco-American forces closed upon the river from the Swiss frontier to

Strasbourg. On March 15, Patton's 3rd army also advanced on the Rhine, crossing the Moselle just short of the confluence at Coblenz. On the same day, the U.S. 7th army struck northward between Saarbrücken and the Rhine. The big German pocket between the Rhine and the Moselle at once collapsed.

Farther north, the U.S. 1st army reached the Rhine at Cologne, which it captured on March 7. On that same day one of its columns, closing to the Rhine farther south, found the Ludendorff railway bridge at Remagen intact, and succeeded in crossing. This was an entirely unexpected gift, not allowed for in Eisenhower's plans; but these were immediately adapted to the new situation.

#### Struggle for the Rhine

Montgomery's army group (of which the U.S. 9th army still formed part) experienced the grimmest fighting in all this Rhineland operation. Its orders were to line up on the Rhine from Düsseldorf northwards. The British 30th corps, under the command of the Canadian 1st army, had to clear the Reichswald, between the Maas and the Rhine, with the aid of the U.S. 9th. There followed one of the fiercest struggles fought in the whole course of the war in the depths of the great waterlogged forest. The enemy cut the Roer dams before abandoning them, and the resulting floods delayed the 9th army's northward thrust; but the two armies linked on March 3. Except for a tenaciously held enemy bridgehead at Wesel, eliminated only a week later, the 21st army group had fulfilled its task.

"The whole of the Allied campaign west of the Rhine had gone according to plan to an extraordinary degree, and my fullest hopes were realized," says Gen. Eisenhower in his report. Chief of those hopes had been that the Germans would fight the decisive battle W. of the Rhine, to compel which the possibility of destroying the 31 Rhine bridges behind the enemy was considered, but abandoned as involving too great a diversion from the existing strategic air effort. The enemy had withdrawn; but he had suffered very heavy losses. He had not stood to the end, and had, with the skill which he had not yet lost, transferred a considerable proportion of his troops and material to the E. bank. Yet the war was almost as good as over. The dis-

person of German war industries, a wise step when it was undertaken, had the disadvantage now, when bombs were raining upon his communications, that the enemy was finding it impossible to bring his equipment and warlike stores to the scene of action.

After a tremendous air and artillery bombardment, the passage of the Rhine by the British 2nd army began on the night of March 23. Next morning two airborne divisions, one British and one American, were landed beyond the Rhine north of Wesel, within range of supporting fire from the west bank, and after the heads of the columns of the land forces were already over the river. The U.S. 9th army also effected a crossing early on the 24th, against moderate resistance. The U.S. 1st army undertook an offensive south from its bridgehead at Remagen. The U.S. 3rd army got over on either side of Mainz.

#### Inequality of Opposing Forces

The opposing forces were now strikingly unequal in power and numbers. On the Allied side stood approximately 83 divisions, including the airborne—60 U.S., 16 British, and seven French. All but a few American divisions, held in reserve, were ready to march into Germany or the Netherlands. On the German side was a maximum of 56 divisions in being, many of them seriously under strength; the skeletons of several others; and a mass of hastily enrolled "home guards." In armament, the contrast was even greater. In the air the Allied advantage was overwhelming; in fact the last occasion when the Luftwaffe was seen in the air in strength was at the opening of the counter-offensive into the Ardennes. Nor was there any further heavy fighting by the standard of what had gone before.

The Allied bridging and engineering work in general was superlative, so that powerful striking forces were soon over the Rhine. The U.S. 1st and 9th armies enveloped the Ruhr area, making contact near Lippstadt on April 1; they trapped the whole of one German army group and two corps of another—a total of 21 divisions. Then deep thrusts, not seriously opposed, were made into the heart of Germany: the French towards the Swiss frontier, the U.S. 7th army towards Munich and the Brenner, the U.S. 3rd on Erfurt and then away down to the Danube below Regensburg and over the Czecho-Slovak frontier,

the U.S. 1st on Leipzig, the U.S. 9th on Brunswick, and the British 2nd on Bremen and Hamburg. The Canadian 1st army swung northward and by the middle of April, after heavy fighting, reached the sea north of Groningen, liberating the Netherlands east of the Zuyder Zee, but leaving strong German forces isolated in "Fortress Holland"—the provinces of N. and S. Holland.

No demarcation line was set in advance for the meeting of the Western Allies and the Russians, local commanders receiving orders to arrange a temporary boundary when contact was imminent. When the time came, this boundary was fixed in the central sector along the Elbe and Mulde rivers. On April 25 patrols of the U.S. 1st army established contact with Russian troops on the Elbe at Torgau.

Pushing along the Danube, the U.S. 3rd army advanced into Austria, entering Linz on May 5, while the 7th took Innsbruck on May 3 and made contact with the U.S. 5th army (see Italy, Campaign in) at Vipiteno beyond the Brenner. In the north, the British 2nd army, reinforced by a U.S. airborne corps, crossed the Elbe on April 29, outflanked Hamburg, and on May 2 reached the Baltic at Lübeck (cutting off the peninsula of Denmark), and made a junction with the Russians at Wismar. On May 4 a German delegation which came to Montgomery's headquarters signed an instrument of unconditional surrender of all naval, land, and air forces opposite the 21st army group. The final surrender of all the forces of the Reich was made to General Eisenhower at Reims on May 7. The military, political, and economic system of Germany had completely collapsed.

#### Victory Never in Doubt

From first to last, except for a brief period at the height of the counter-offensive in the Ardennes, the Allies had never lost the initiative. They had gone forward remorselessly, and victory had never been seriously in doubt. Their casualties had been heavy, those for the land forces numbering in dead, wounded, and missing 766,967 (American 514,534, British and Canadian 184,512, French 61,247, the balance being made up of Poles, Czechs, Belgians, and Dutch); but these casualties were far below those inflicted upon the enemy. *Consult* Report by the Supreme Commander to the Combined Chiefs of Staff on the Opera-

tions in Europe of the Allied Expeditionary Force, 1946; Report by the Supreme Commander, Mediterranean, to the Combined Chiefs of Staff on the Operations in Southern France 1946; Dispatch to the Secretary of State for War on Operations in N.W. Europe, June 6, 1944–May 5, 1945, by F.M. the Viscount Montgomery, 1946.

**Europeanism.** Term used to describe advocacy of a united Europe. This idea is rooted in experience—e.g. the Roman Empire, with its civilizing and materially beneficent influence; Charlemagne's "universal monarchy"; the unity created by the R.C. church. The breaking up of each of these unities, partial as they were, was followed by the strife, and economic and cultural destruction, which have been characteristic of Europe since the later middle ages.

On the basis that the peoples of Europe, all deriving their thought and ways of life from Greco-Roman and, later, Christian sources, have enough in common to form a political unit, George Podiebrad, king of Bohemia (1420–1471), advocated a general European federation, based on a permanent alliance of rulers, as a protection against the Turks. A similar scheme, devised by Maximilien, duc de Sully (1559–1641), friend and first minister of Henry IV of France, in his Grand Design, was elaborated and given a legal framework by Hugo Grotius (1583–1645), the great Dutch statesman and humanist, founder of international law. William Penn, in 1693, sketched a somewhat less definite organization of European states as a means for securing permanent peace. Charles Irénée Castel, Abbé de St. Pierre (1658–1743), based his *Projet de Paix Perpétuelle* (1713) on Sully's project. The Koenigsberg philosopher Immanuel Kant (1724–1804) advocated, in his short and precise treatise *Towards Eternal Peace* (1795), a parliamentary federation of Europe. Napoleon interpreted the idea in his own way as a Europe dominated by himself.

Le comte de Saint-Simon (1760–1825), with his friend Thierry, drew up a scheme for a European federation under a king and parliament on the British pattern, and with a unified currency, in 1814; and a German author, A. Mallinckrodt, also at the time of the Vienna Congress, 1815, introduced into the idea the economic motive, which in some shape has remained a fundamental part of its subse-

quent formulations, by suggesting free trade, unified currency and weights and measures, and free movement within a federated Europe. Frenchmen like Léon Faucher (1837) and G. de Molinari (1879), and a German, R. von Kaufmann (1880) advocated customs unions embracing, in the first place, several economically complementary powers; Comte P. de Leusse saw in a Franco-German customs union the solution of Europe's main problem (1888). A committee was set up in 1908, under the French lawyer and economist Lucien Coquet and the German Dr. Borgius, to develop this idea.

Count Richard Coudenhove-Kalergi (*q.v.*) with the backing of outstanding Europeans made a new approach to the problem in his *PanEuropa* (1923). An international group of economists and statesmen, formed by Edgar Stern-Rubarth with the help of the Hungarian E. Bleier and the Frenchman L. Coquet, and under Briand's chairmanship, worked for a European customs union. The Oslo Convention (*q.v.*), 1937, was an attempt to lay the foundations of such a union. The rise of Nazi-Fascist systems of government, and the outbreak of war stopped practical extension of the idea, but not of the idea itself, which, during and after the Second Great War, found expression in *e.g.* Western Union (*q.v.*).

**European Recovery Programme.** Internationally concerted plan and action to restore economic stability to post-war Europe, based on financial and material assistance from the U.S.A. ("Marshall aid") and on economic co-operation among the nations of Western Europe that remained outside Russian influence. For full details see the N.V. pages at the end of this Encyclopedia.

**Europium.** Chemical element, one of the terbium family of rare earths, moderately soluble in a saturated solution of potassium sulphate. Demarçay isolated the nitrate by fractional crystallisation in 1896, Crookes having noticed a red band in the phosphorescent spectrum of a fractionated yttria earth. In 1939 Trombe separated 98 p.c. pure europium by a process of distillation in argon under pressure from the electrolytically prepared alloy with cadmium. This metal has the same hardness as neodymium and a melting point between 1,100–1,200° C. The atomic weight as determined by the mass spectro-

graph is 151.89 and by the analysis of pure europous chloride 151.96. The atomic number is 63. Europium has a body centred cubic structure. Europia,  $\text{Eu}_2\text{O}_3$ , is a pale pink powder. It forms a hydroxide, chloride, dichloride, oxychloride, sulphate, carbonate, and nitrate. Traces may be separated from gadolinium by the action of dilute sodium amalgam under acid conditions.

**Eurotas.** River of ancient Laconia, Greece, now known as Iri. It discharges into the Gulf of Laconia after a course of 60 m. Sparta stood on its banks.

**Euryale ferox.** Aquatic perennial herb of the family Nymphaeaceae. It is a native of the E.

*Euryale ferox.* Leaves and flowers of this East Indies aquatic plant

Indies. Its circular floating leaves are 1 ft. to 4 ft. in diameter, the rich purple underside, like the sepals of the purple flower, being protected by numerous spines. The fruit is a round berry containing numerous farinaceous seeds, which are eaten after being baked in sand. The Chinese cultivate the plant for these seeds.

In Greek mythology Euryale is the name of one of the Gorgons (*q.v.*). *Pron.* U-rye-alee.

**Eurydice.** In Greek mythology, wife of the poet Orpheus. When she died Orpheus went down into Hades, and by the power of his lyre induced Pluto, ruler of the underworld, to restore his wife to him, on condition that Orpheus did not look behind until he reached the earth again. In his eagerness to see if his wife were following, he forgot the condition, and Eurydice was lost to him for ever. See Orpheus. *Pron.* U-riddi-see.

**Eurymedon.** Ancient name of the Kopru Su, a river of Pamphylia, Asia Minor. It flowed into the Mediterranean, W. of the Taurus Mts., and at its mouth the Athenians under Cimon (*q.v.*) defeated the Persians 466 B.C.

**Eurypterida** (Gr. *eury*s, broad; *pteron*, wing). Extinct scorpion-like animals of the class Arachnida (*q.v.*). The body is rather flat, sometimes as much as 6 ft. in length, covered by a thin horny covering (carapace) and ornamented by fine, scale-like markings. The head is semicircular, consisting of six segments fused together, and six pairs of appendages are attached to the head-shield, the last pair being adapted as swimming paddles. The abdominal portion is long, of 12 segments, the first six bearing plate-like appendages with leaf-like gills. The last segment is a tail-plate, sometimes produced into a long spine. The upper surface of the head-shield has two eye-spots near the centre, and a large pair of faceted eyes near the margin. Eurypterids originally inhabited the sea, but became adapted to brackish and possibly to freshwater conditions. Fossils are found in Silurian, Devonian, and Carboniferous strata.

**Eusebius** (c. 264–340). Church historian. Often called Eusebius Pamphili, he was probably a native of Palestine and spent his youth at Caesarea. After the martyrdom under Diocletian of his teacher Pamphilus, he took refuge in Egypt, and about 313 was appointed bishop of Caesarea by the emperor Constantine the Great. At the council of Nicaea, 325, though himself orthodox, he showed leanings towards the Arian party. His historical writings especially *Præparatio Evangelica* (selections trans. H. Street, 1842), *Demonstratio Evangelica*, and *Historia Ecclesiastica*, entitle him to be called the father of ecclesiastical history. The *Historia* has been translated into English by A. C. McGiffert, 1890.

**Eustachian Tube.** Tube leading from the upper part of the pharynx to the tympanic cavity of the ear. Its function is to maintain equal atmospheric pressure on both sides of the ear-drum. It is ordinarily closed, but is opened by each act of swallowing. Blocking of the tube, as in catarrhal conditions or from the growth of adenoids, leads to bulging of the membrane and partial deafness. If the passage does not open when the catarrh disappears, the obstruction can usually be removed by inhaling steam or by blowing air into the tube. If it is due to adenoids, the growth must be removed. The tube is named after Bartolommeo Eustachio (d. 1574), Italian anatomist. See Ear.

**Eustachian Valve.** The valve guarding, on the right, the opening of the great veins into the auricle of the heart. It is derived from the remains of the right sino-auricular valve of the generalised vertebrate form. It assists in preventing the reflux of blood when the right auricle contracts.

**Eustatic Movements.** In geology and geography, world-wide changes in sea-level, in contradistinction to apparent changes resulting from movements of the land. Because land movements may be in progress at the same time as eustatic movements it is often difficult to differentiate between the two. The removal of water from the oceans to form the great ice-sheets of the Pleistocene period caused a lowering of sea-level of 300 ft. or more. As the ice melted the water returned to the oceans and the level was raised once more. Such eustatic movements have influenced development of coral islands, and were probably responsible for the submarine canyons in the continental slopes. *See* Earth Movement.

**Euston Road.** London thoroughfare. With Marylebone Road on the W. and Pentonville Road on the E., it forms part of the New Road laid out in 1754-56 to connect Paddington and Islington, and extends from Great Portland Street to King's Cross. In Euston Square is the entrance to Euston railway terminus. St. Pancras, another great terminus, is in Euston Road, as is also King's Cross terminus. The Metropolitan and District lines of London Transport have a station at King's Cross, at the Gower Street corner (Euston Square), and at Great Portland Street. The Northern Line goes through Warren Street (at the Tottenham Court Road corner), Euston, and King's Cross. The Piccadilly Line has a station at King's Cross. In Euston Road are the (new) church of S. Pancras, built 1819-22, a modified copy of the Erechtheum at Athens; Unity House, headquarters of the National Union of Railwaymen; and Friends House, headquarters of the Society of Friends.

**Eutaw Springs.** Locality and river of S. Carolina, U.S.A.; the latter being a tributary of the Santee river. Near here on Sept. 8, 1781, was fought an indecisive battle in the War of Independence. The American force under General Greene gained an early success over the British under General Stuart, but the latter successfully withstood a second onslaught.

**Eutectic** (Gr. *eu*, well; *tēkein*, to melt.) A condition of chemical equilibrium. The lowering of the freezing point of water by the addition of common salt was investigated by Raoult. Guthrie in 1878 discovered that at a certain temperature,  $-22^{\circ}$  C., and concentration, 23.5 p.c. of salt, the solution solidified completely as one mass. He called this type of mixture a eutectic and, for any two substances, the temperature and concentration remain constant. The term is used widely in connexion with the freezing and melting of alloys.

If two metals are completely soluble in each other in the liquid state, but either partly or wholly insoluble in the solid state, they may form a eutectic. Examples are lead and antimony, lead-silver, lead-tin, copper-silver. The phenomenon is best recognized by an examination of the constitution diagrams (*q.v.*) of such systems. Thus, if a melt of 50 p.c. each of lead and antimony is cooled slowly, seed crystals of antimony form in the melt. This leaves the latter poorer in antimony, but further cooling causes the seed crystals to grow, reducing the antimony content of the liquid still further. Finally a composition and temperature are reached at which both lead and antimony solidify together; this is the eutectic point, and the alloy is known as the eutectic, in this example containing 12.5 p.c. of antimony. Similarly an alloy containing only 5 p.c. of antimony deposits crystals of lead from the melt on cooling; these grow until the melt again reaches the eutectic composition. An alloy containing exactly 12.5 p.c. of antimony will solidify as a mixture of fine crystals at  $247^{\circ}$  C., considerably below the melting points of both lead and antimony. This lowering of the melting point is characteristic of the eutectic.

Alloys which form an unbroken sequence of solid solutions show no eutectic, but often metals will alloy as solid solutions over part of the range of composition, while between the limits of these ranges they will form eutectics. The same principles apply for alloys of three or more metals. Plumber's solder, containing 2 parts of lead to 1 part of tin, is a eutectic alloy, and its low temperature of solidification, below that of lead, makes it suitable for wiping joints.

**Eutectoid.** Essentially similar to a eutectic (*v.s.*), a eutectoid, however, is formed entirely in the solid state. Just as a molten

solution of two metals may break up into two types of crystal when it becomes solid, so a solid solution may break up into two different, but closely admixed, constituents. This is of particular importance in aluminium bronze and steel: a eutectoid steel contains 0.87 p.c. of carbon in iron, and the eutectoid is known as pearlite, as it resembles mother-of-pearl when viewed under the microscope. Quenching restricts this change and causes hardening due to the strained state of the crystal lattice.

**Euterpē** (Gr., the well-pleasing). In Greek mythology, one of the nine muses. Her province was lyric poetry. *See* Muses.

**Euthanasia** (Gr. *eu*, well; *thanatos*, death). Easy or comfortable death; in medical language, the employment of means calculated to render the death of those suffering from painful and incurable diseases as painless as possible. Induced euthanasia was advocated by Plato, and was common under the Roman emperors, many of Pliny's friends being recorded as submitting to it. In the island of Ceos (Zea), in the Cyclades, euthanasia was enjoined on citizens over 60. In old Marseilles it is said that the authorities were memorialised in cases of serious illness, or even of dire misfortune, as to the advisability of euthanasia. In More's ideal state, Utopia, euthanasia was practised.

**Eutheria** (Gr. *eu*, well; *thērion*, beast) OR PLACENTALS. One of the three sub-classes of Mammalia, the other two being the prototheria or monotremes and the metatheria or marsupials. Of these the prototheria are oviparous; the metatheria bring forth their young prematurely and nurture them in a pouch; and the eutheria produce more or less perfectly developed young, which during gestation are vitally united to the mother by a placenta.

**Eutropius.** Roman historian of the 4th century A.D. Secretary to the emperor Julian, he was the author of *Breviarium ab Urbe Condita*, a short history of Rome from its foundation to 364. The work has little historical value but the simplicity of its style has made it a favourite text-book for beginners in Latin.

**Eutyches** (*Fl.* 5th century, A.D.). Founder of the Eutychiean heresy. Superior of a monastery at Constantinople, he taught that the human nature of Christ was absorbed in the divine, and there-

fore non-existent, even His body not being truly human. For this he was condemned by a synod at Constantinople in 448, restored by the "Robber" council of Ephesus in 449, but finally condemned by the council of Chalcedon in 451, and afterwards banished. *Pron. U-ty-keez.*

**Euxine.** Ancient name of the Black Sea, the Pontus Euxinus, or hospitable sea. It was originally called Axenos, inhospitable, from the prevalent storms, and the hatred of strangers shown by the dwellers on the coasts. The name was probably changed when increasing commerce and the establishment of Greek colonies made it better known. *See* Black Sea.

**Evacuation** (Lat. *evacuatio*, I empty). Military term for the act of withdrawing from a position. It was also applied to the movement of the civil population from areas threatened with aerial bombardment or invasion during the Second Great War. In Great Britain, under plans already prepared, evacuation from the London area began on Sept. 1, 1939. In four days some 370,000 children accompanied by their teachers, and nearly 280,000 others with their mothers, left the metropolis. Altogether 1,270,000 people went from 81 evacuation areas to 1,100 reception areas, chiefly in Lancs, Yorks, Derbyshire, Wales. This number rose to 1,341,000 in February, 1941. Under the government scheme for the evacuation of children between the ages of five and 16 to the British dominions, some 2,650 had reached their temporary homes in other countries before the sinking of the liner City of Benares on Sept. 17, 1940, when 77 children bound for Canada perished, caused the government to suspend the scheme.

Many government departments, banks, business houses, and sections of the B.B.C. moved out of London; and thousands left the threatened areas privately. Abroad 15,000 women and children were moved from Gibraltar in 1940, some 11,000 to the U.K.

Many "evacuees" returned to London during 1942-44; but the flying bombs caused a second mass evacuation, some 280,000 leaving London, July 2-Aug. 8, 1944.

Govt. sponsored return to evacuation areas in the N., W., Midlands, and S.W. began in Sept., 1944; to E. Anglia in March, and to London, Hull, and Grimsby in May, 1945. By July, 1945, only 76,000 remained in reception areas; by April, 1948, when the last count

was taken, 3,567. The scheme ended July 5, 1948, when the home secretary, under the Children Act, became responsible for unaccompanied children, and old people in hostels and the physically handicapped came under the provisions of the National Assistance Act. Allied air attack on W. Germany and Berlin led to the evacuation of millions to Silesia, Poland, Czecho-Slovakia, and Austria.

**Evagoras** (d. 374 B.C.). King of Salamis in Cyprus. Seizing the throne c. 410, he developed the naval power of his kingdom. He was on friendly terms with the Athenians, especially with the Athenian admiral Conon (q.v.), and it was due to him that Conon was helped by the Persian fleet at Cnidus (q.v.) in 394. Subsequently, in the war between Evagoras and the Persians, the Athenian fleet came to his aid. The war with Persia dragged on for several years, and was eventually ended by a settlement which guaranteed to Evagoras his kingdom. He was murdered by a courtier.

**Evagrius** (c. 536-600). Byzantine eccles. historian. Born at Epiphania, in Coele-Syria, he flourished during the reigns of the emperors Tiberius and Maurice. At first he studied law at Antioch, whence his surname Scholasticus (advocate). One of the continuators of Eusebius, his history covers the period from the council of Ephesus, 431, down to 593. It throws light chiefly on the religious controversies of the period.

**Evander.** A legendary Italian hero. Some time before the Trojan war he was said to have conducted a band of colonists from Pallantium in Arcadia to Italy, where he founded a settlement on the Palatine hill. Writing and other arts and the institution of the Lupercalia in honour of the Arcadian god, Pan, were ascribed to him. Evander, who figures in the Aeneid of Virgil, is really the Italian Faunus (the favourable one), to whom the Greek Pan also corresponds, and the story of the Arcadian colony, like much in Roman mythology and legend, is due to Greek influence.

**Evangelical** (Gr. *evangelikos*, of the Gospel). Term applied to the religious revival within and without the Anglican Church in the 18th century. The movement was started by John and Charles Wesley and George Whitefield. They had all been members of the Holy Club at Oxford (1729-35). In 1738 John Wesley experienced conversion at the Moravian chapel

in Aldersgate, and shortly afterwards, following Whitefield's example, he began open air preaching at Bristol, at Moorfields, and Kennington, and up and down the country for the rest of his life. His followers broke away from the Established Church after Wesley's death, and formed the Methodist or Wesleyan Churches. (*See* Methodism.)

Other leaders in the 18th century were Romaine (S. Dunstan's, Fleet St.); Henry Venn (Huddersfield); Grimshaw (Haworth); Fletcher (Madeley); Walker (Truro); Berridge (Everton, Beds); Newton (S. Mary Woolnoth, Lombard St.); Scott (Olney); John Thornton, the banker; and Cowper the poet, who with Charles Wesley, Toplady, Cecil, and others created modern hymnology. In the 19th century the leading men were Charles Simeon, who carried on work in Cambridge already begun by Isaac Milner; Dale (S. Bride's, Fleet St.); Daniel Wilson (Islington); McNeile (Liverpool); Stowell (Manchester); and especially John Venn, and the six laymen Henry Thornton, William Wilberforce, Charles Grant, James Stephen, Zachary Macaulay, and Lord Teignmouth, who formed the Clapham sect.

The movement promoted Sunday Schools (Hannah More), benevolent societies, a revival of parochial life, the training of candidates for the ministry, the distribution of the Bible, pastoral work in big towns, missionary work abroad, the abolition of the slave trade (Wilberforce and Buxton) and the passing of the first Factory Acts (Lord Shaftesbury). These different activities were mainly carried on by big societies founded at the turn of the 18th and 19th centuries—Church Missionary, Bible, and Religious Tract Societies. Later came the London Jews, Church Pastoral Aid Society, Church Association, Y.M.C.A., Y.W.C.A., etc.

The Evangelicals emphasised original sin, the efficacy of the Atonement, the need of personal conversion, justification by faith, and veneration for the letter of the Scriptures. What is known to-day as the Low Church party in the Church of England (to be distinguished from the Low Church party of the period preceding the Evangelical revivals) is usually called evangelical. Its leaders meet annually at the Keswick Convention and the Oxford and Islington Conferences. The term evangelical is applied to the United Lutheran

and Reformed Church in Germany and to the Protestants of France. It forms part of the title of the World's Evangelical Alliance (*q.v.*) and of similar organizations in America. In the 20th century the Anglican Evangelical Group Movement was founded and led by Canon Storr of Westminster, to promote more liberal and scholarly teaching of the earlier doctrines of the movement. *Consult* The Evangelical Revival in the 18th Century, J. H. Overton, 1909; History of the Evangelical Party in the Church of England, G. R. Balleine, 1929.

**Evangelical Union** OR MORISONIANS. Scottish Presbyterian body. It was founded by the Rev. James Morison of Kilmarnock and other seceders from the United Secession Church in 1843. Soon afterwards they were joined by ministers expelled from the Congregational Union. They rejected the doctrine of predestination, and maintained universal redemption and the freedom of the will. The churches were independent and free to adopt Presbyterian or Congregational forms of government. All ministers had to be total abstiners. The bulk of the congregations joined the Congregational Union (of Scotland) in 1896.

**Evangeline.** Narrative idyllic poem by H. W. Longfellow. First published in 1847, the story is a romantic account of the deportations in 1755 of the French Acadians from Acadie (Nova Scotia), owing to their lack of sympathy with their British and Protestant rulers. It is a tender, tragic romance, beautifully told, and one of the most successful instances in English of the sustained use of hexameters. The poem is named from the heroine, who was first to have been Gabrielle, a name later adapted as Gabriel for the hero.

**Evangelist** (Gr. *evangelistēs*, proclaimer of glad tidings). Originally one chosen by the apostles to preach the Gospel where it was unknown. Theodoret first restricted the name to travelling preachers; Oecumenius first applied it to the authors of the four Gospels; today it is also used for missionaries and revivalist preachers. (*Consult* Eph. 4; Acts 8 and 21; 2 Tim. 4.) The four living creatures referred to in Ezek. 1 and 10, and Rev. 4, were regarded by Jerome as symbols of the four evangelists—the man, Matthew; the lion, Mark; the ox, Luke; the eagle, John. Irenaeus assigned the lion to John and the eagle to Mark; Augustine and Bede, the lion to

Matthew and the man to Mark. Evangelist is the character who first shows the way to Christian in Bunyan's *Pilgrim's Progress*. See *Apostle*; *Gospel*; *Preaching*.

**Evans, SIR ARTHUR JOHN** (1851–1941). A British archaeologist. Eldest son of Sir John Evans (*q.v.*), he was born July 8, 1851, at Hemel Hempstead, and went from Harrow to Brasenose College, and Göttingen. From 1873 he engaged in archaeological exploration in Finland, Lapland, and the Balkans. Keeper of the Ashmolean Museum at Oxford from 1884, he raised it before his retirement in 1908 to the status of a national institution. His first visit to Crete, 1893, yielded the discovery of a pre-Phoenician script, which led to fresh study of Mycenaean culture. Even more valuable was Evans's excavation, 1900–08, of the Minoan palace at Knossos, the discoveries attracting attention from scholars and antiquarians all over the world. Professor of prehistoric archaeology at Oxford, 1910, and of many learned societies and institutions, Evans

Sir Arthur Evans,  
British archaeologist  
Lafayette

made his house at Boar's Hill a centre for students. He published the results of his excavations, notably *The Palace at Minos*, 2 vols., 1921 and 1928. He married Margaret (d. 1893), daughter of the historian Edward Augustus Freeman; he was knighted 1911; and died July 11, 1941.

**Evans, CARADOC** (d. 1945). A Welsh novelist and journalist. The son of a Carmarthen auctioneer, he was born at Pantycroy, Llandyssul, and left school at 13 to be apprenticed to a linen draper. During the First Great War his vituperative references to the Welsh in *My People*, 1915, and *Capel Sion*, 1916, incensed his fellow countrymen. A copy of his play, *Taffy*, 1923, was publicly burned in a refuse destructor at Barry. A novel, *Morgan Bible*, 1943, was followed posthumously by *Mother's Marvel*, 1949. Evans was editor of *T.P.'s* and *Cassell's Weekly* in 1925. He died at Aberystwyth, Jan. 11, 1945. His second wife, Countess Barcynska (Oliver Sandys), wrote his biography in 1946.

**Evans, DAME EDITH** (b. 1888). British actress. She was born in

London, Feb. 8, 1888, and made her first professional appearance on the stage as Cressida at the

Dame Edith Evans,  
British actress

King's Hall, Covent Garden, 1912. After touring with Ellen Terry in Shakespearean repertory, she appeared in *My Lady's Dress* in 1920, and the following years scored a great personal success as Lady Utterword in *Heartbreak House*. This was one of many parts she created; others were those of *The Serpent* and *The She-Ancient in Back to Methuselah* (*q.v.*); *Florence Nightingale in The Lady with a Lamp*; *Orinthis in The Apple Cart*; *Irela in Evensong*; *Gweny in The Late Christopher Bean*; *Agatha Payne in The Old Ladies*; *Sanchia Carson in Robert's Wife*. Distinguished performances which must also be accounted *troups de force* included those as *the Nurse in Romeo and Juliet*; *Rosalind in As You Like It*; *Millamant in The Way of the World*; *Lady Pitts in Bride's Daphne Laureola*. Her film début was in *the Queen of Spades*, 1949. A versatile as well as a brilliant actress, Dame Edith (or. 1945) displayed a mastery of technique and a genius for artificial comedy.

**Evans, EDWARD RATCLIFFE** GARTH RUSSELL (b. 1881). British sailor. Known as Evans of the Broke, he was raised to the peerage Oct., 1945, as Baron Mountevans (*q.v.*) of Chelsea.

**Evans, SIR GEORGE DE LACY** (1787–1870). British soldier. Born at Moig, co. Limerick, he entered the Indian army in 1806, and in 1812 he joined the 3rd Dragoons in the Peninsula. In 1835–37 he commanded the legion recruited in England to assist Queen Isabella of Spain against the Carlists. Though ill-equipped and neglected by the Spanish government, it fought well. Evans was knighted 1839, promoted general 1861, and died Jan. 9, 1870.

**Evans, SIR JOHN** (1823–1908). British archaeologist and numismatist. Born at Britwell Court, Bucks, Nov. 17, 1823, in 1840 he entered his uncle's paper mills at Hemel Hempstead. Admitted a fellow 1861, he was treasurer of the Royal Society, 1878–98. He was president of the Geological Society, 1874–76; the Numismatic Society, 1874–1908; the Society of An-

tiquaries, 1885-92; and the Anthropological Institute, 1877-79. He wrote standard works on Coins of the Ancient Britons, 1864; Ancient Stone Implements, 1872; Ancient Bronze Implements, 1881. Knighted 1892, he died May 31, 1908. His collection of 1,700 coins was presented to the British Museum by his son, Sir Arthur (*q.v.*).

**Evans, MARIAN OR MARY ANN** (1819-80). Maiden name of the British novelist who wrote as George Eliot (*q.v.*).

**Evans, OLIVER** (1755-1819). American inventor. Born at Newport, Delaware, he entered his brother's milling business, and invented and fitted up various appliances for economising time and labour. The machinery was worked by water power, and revolutionised the grinding of corn. Americans claim that Evans designed the first steam engine on the high-pressure principle, and it is agreed that his plans, sent to England, were seen by Trevithick. Although never so successful as Watt, he was one of the pioneers of steam locomotion, and ranks as one of the most ingenious mechanics that America has produced. He died at New York, April 16, 1819.

**Evansston.** City of Illinois, U.S.A., in Cook co. It stands on Lake Michigan, 13 m. N. of Chicago, of which it is a residential suburb, and is served by rlys. The seat of North Western university, it was settled in 1835, incorporated 1863, and chartered as a city 1892. It makes glass products, dairy equipment, and paint; and processes fruit and vegetable juices. Pop. 65 389.

**Evansville.** City of Indiana, U.S.A., the co. seat of Vanderburgh co. On the Ohio river, 185 m. S.W. of Indianapolis; it is served by rlys. and an airport. A port of entry, it trades in coal, flour, and tobacco, and has cotton, woollen, and flour mills, meat packing plants, stockyards, foundries, machinery works, and cigar, glass, and leather factories. The Mead Johnson terminal provides for the interchange of river, rail, and road traffic. Evansville dates from 1817 and became a city in 1847. Pop. 97,062.

**Evaporation** (Lat. *e*, from, out; *vapor*, vapour). Name commonly given to the process by which a liquid, and less commonly a solid such as carbonic acid snow, changes into a state of vapour. Evaporation may be said to be a function of heat and pressure. Liquids may evaporate at all temperatures; under the application

of heat or the removal of pressure from their surfaces, they evaporate more quickly. At a given temperature evaporation in a closed vessel ceases when a certain pressure of vapour is attained, for thin condensation of the vapour balances the evaporation of the liquid.

The rate of evaporation of a liquid depends upon the area of the surface exposed, the freedom of the space surrounding it from vapour, and the difference between the vapour pressure and the external pressure. Thus a given volume of a liquid evaporates more quickly in a shallow dish than a deep one, in a dry atmosphere than a damp one, and on a warm day than a cold one. The movement of the atmosphere over the surface of the liquid also increases the rate of evaporation, as the evaporated particles are carried away.

In converting a liquid into a vapour at the same temperature, heat has to be supplied. In other words, heat is absorbed in the process of evaporation. Evaporation thus produces a cooling effect, and this is the basis of refrigeration in certain types of ice-making machines. The quantity of heat that has to be supplied to one gram of liquid at the boiling point without changing its temperature is called the latent heat of vaporisation. This is the same thing as the quantity of heat given out by one gram of the vapour at boiling point, when condensing to a liquid at the same temperature.

Evaporation of water is of great importance in nature. It has been shown that the atmosphere gains as much from green grass-covered soil as from a water surface. Evaporation is at a maximum during the summer months owing to high surface temperatures, winds, and increased water-holding ability of the warmer air. On foggy winter days condensation rather than evaporation may be the rule. When percolation into the soil is small, evaporation is given by the difference between rainfall and run-off. See Boiling Point; Condenser; Heat.

**Evaporation Value.** Method by which the relative values of different fuels may be expressed. It consists in stating the amount of water which each is capable of converting into steam when the fuel is burnt under specified conditions. Thus one pound of average coal can theoretically convert 15 pounds of water at boiling temperature in the atmosphere into steam; while under the same conditions petroleum would convert

21 pounds, and ordinary dry straw 8½ pounds. These figures represent evaporation values. See Fuel.

**Evaporimeter.** An instrument for measuring rate of evaporation of water from a surface to the atmosphere. The most direct method of determining evaporation from a free water surface comprises observation of the level of water in a sunken tank, allowance being made for rainfall (*e.g.* Symons evaporimeter). Other evaporimeters are concerned with evaporation from natural grass and earth surfaces.

**Evatt, HERBERT VERE** (b. 1894). Australian politician. He was born April 30, 1894, at East

Herbert V. Evatt,  
Australian politician

Maitland, N.S.W., and educated at St. Andrew's college and Sydney university. Having been tutor in philosophy at St. Andrew's and lecturer in legal interpretation at Sydney, he was a Labour member of the N.S.W. legislative assembly, 1925-29. A justice of the federal high court, 1930-1940, he became attorney-general and minister for external affairs in 1941, representing his country at discussions of the Pacific war situation in Washington and Paris, at the San Francisco conference, and at the Paris peace conference. In 1946 he was appointed deputy prime minister. He attended the conference of Commonwealth prime ministers in London, Oct., 1948, and in the same year was chairman of the U.N. general assembly in Paris. He lost office with the electoral defeat of his party in 1949. Evatt published *Australia in World Affairs*, 1946.

**Eve.** Name of the first woman in the Biblical story of creation. In Hebrew the form of the name is *Chawwah*. It was given to the woman by Adam (Gen. 3, v. 20), and is explained as meaning "living" or "life." She was so called, it is stated, because she was the mother of all living. See Adam; Creation.

**Evection** (Lat. *e*, out; *vehere*, to carry). Inequality of the moon's motion, which increases or diminishes the mean longitude of the moon to the extent of 1 deg. 16 mins. at maximum.

**Evelina.** Fanny Burney's first novel. The first avowed novel of society, it was published anonymously in 1778 under the title of

Evelina; or a Young Lady's Entrance into the World. Johnson declared that there were passages in it which might do honour to Richardson.

**Evelyn, JOHN** (1620-1706). English author and diarist. He was born at Wotton House, Surrey, Oct. 31, 1620, educated at Lewes and Balliol College, Oxford, and became a student of the Middle Temple. Possessing ample means, he remained abroad during the greater part of the Civil War. A sincere royalist and churchman, his admiration for Charles II in exile did not blind him to the king's faults when, after the restoration, Evelyn enjoyed favour at court.

During 1653-94 Evelyn was settled at Sayes Court, Deptford, where he transformed a rude orchard and field of 100 acres into a pleasure of notable charm. He befriended Jeremy Taylor and other divines, and was on terms of intimacy with Bentley, Boyle, Pepys, Grinling Gibbons, and Hollar. He helped to found the Royal Society, and was its secretary in 1672. He was a commissioner for the rebuilding of St. Paul's Cathedral; aided church establishment in the plantations; was a commissioner of the privy seal, 1685-87; and treasurer of Greenwich Hospital, 1695-1703.

In addition to gardening and forestry, he took an active interest in agriculture, architecture, art, engraving, music, and navigation. His *Sylva*, 1664, first drew attention to the importance of afforestation in England; *Terra*, 1676, was a first attempt in English at a scientific study of agriculture; *Sculptura*, 1662, a work on engraving, was suggested by Boyle. He wrote a *Character of England*, 1659, an admirable *Life of Mrs. Godolphin*, a discourse on Medals, and a *History of the Dutch War*, which is lost.

He is best remembered for his *Diary*, 1620-1706 (more properly memoirs), a work valuable for its reflection of the political, social, and religious life of his time. Descriptions of the fire of 1666 and the great storm of 1703 show that he could write vividly. The MS was in danger of destruction when, at the suggestion of William Upcott,

it was edited by William Bray, and first published in 1818. After 1694 Evelyn lived at Wotton, where he died, Feb. 27, 1706, and was buried in the chapel. He is well described as a patriot who kept his loyalty in dangerous times, a Christian who preserved his integrity in the most immoral, and a philosopher who viewed every object with a desire to extract from it all the beauty and goodness it contained. Consult editions of the *Diary*, with *Life* by H. B. Wheatley, 1906; and by Austin Dobson, 1908; *Life*, Lord Ponsonby, 1934.

**Evening News, THE.** London evening newspaper. Started in 1881 in the Conservative interest as a rival to *The Echo*, in 1889 it absorbed *The Evening Post*, founded 1887. In 1894 it was acquired for £25,000 by a new company of which Alfred Harmsworth (Viscount Northcliffe), Harold Harmsworth (Viscount Rothermere), and Kennedy Jones were the proprietors. Under the new direction it emerged from an almost moribund concern into a property yielding in the first year a profit of £14,000 and in the second £25,000. Its ever-increasing success—it had in 1947 a net sale of 1,641,394—led to the foundation of *The Daily Mail*. From 1894 until 1896 Kennedy Jones was editor; he was succeeded by W. J. Evans. F. L. FitzHugh was editor 21 years, retiring in 1944. Prominent regular contributors have included Claude Burton (C. E. B.), Oswald Barron (The Londoner), the cartoonist P. H. Fearon (Poy), Arthur Machen, Sir John Squire, Frank Swinnerton, Frances Pitt, and the humorous artist Joseph Lee. It is issued by The Associated Newspapers, Ltd. See Northcliffe, Viscount.

**Evening Primrose** (*Oenothera biennis*). Biennial herb of the family Onagraceae. It is a native of N. America.

The leaves are oblong-lance-shaped; the flowering stem (2nd year), 4 ft. or 5 ft. high, branched, with narrower, toothed leaves, terminates in a long spike of large, pale yellow flowers, opening in the evening. The variety *lamarckiana* has much larger flowers than the type form, and has been much studied. See Mutation.

Evening Primrose, a biennial herb

**Evening Schools.** Term specifically given to evening classes established in the United Kingdom, mainly during the first half of the 19th century, for giving elementary instruction to illiterate adults. One of the earliest was started at Bala, N. Wales, in 1811. The system was warmly supported by Bishop Hinds in 1839, and was adopted by the Ragged School Union, founded 1844, and known since 1898 as the Shaftesbury Society. The term is still unofficially applied to schools in which pupils beyond the compulsory school age may continue to study. See Further Education.

**Evening Standard, THE.** London evening newspaper, started June 11, 1860, as a pendant to its morning namesake, itself originally an evening paper first published May 21, 1827. Acquired from the Johnstone family in 1905 by C. Arthur Pearson, who had in 1903 purchased the *St. James's Gazette* (founded in 1880), *The Evening Standard* was merged with the latter. In 1910 Davison Dalziel secured the controlling influence; in 1915-23 it was owned by Hulton & Co., and from 1924 by Lord Beaverbrook. Famous regular contributors have included Arnold Bennett, Dr. W. R. Inge, and the cartoonist David Low.

**Evenlode.** Tributary of the river Thames, in Oxfordshire, England. Rising near Kingham on the Gloucestershire border, it flows generally S.E. to join the main river between Eynsham and Yarnton, 4 m. N.W. of Oxford.

**Evensong.** Form of worship prescribed by the Prayer Book of the Established Church. First drawn up in 1549 and revised in 1552 and 1662, it consists of responses, psalms, lessons, and collects taken from the services of vespers and compline in the medieval breviary, with additional features such as general confession and absolution, prayers for king, clergy, people, etc.

**Everest.** The world's highest mt., 29,141 ft. (official alt. is still 29,002 ft.). It is in the Himalayas, on the border between Nepal and Tibet. Named after Sir George Everest (1790-1866), surveyor general of India, its peak has often been confused with that of its neighbour, Gaurisaukar. It is covered with snow and difficult of access; practically every expedition to Everest has entailed heavy loss of life, and the summit still remains unscaled.

Of the expeditions on foot, those in 1921 and 1935 were

Everest. Diagram showing at A, B, and C the positions of the three highest camps established by all climbers. D, height reached by Norton and Somerville, June 4, 1924. E, spot where Mallory and Irvine disappeared, June 8, 1924. F, broken and dotted lines indicate alternative proposed routes to the summit

reconnaissance, and those of 1922, 1924, 1933, 1936, and 1938 attempts to scale the mountain. Two members of the 1924 expedition, A. C. Irvine and G. L. Mallory, reached 28,800 ft. and then set out alone to climb the remainder of the distance; they disappeared at 28,239 ft., though it was generally believed that they reached the summit and were unable to return.

**EVEREST AIR EXPEDITION.** In 1932 Lt.-Col. L. V. Stewart Blacker and Col. P. T. Etherton formulated plans to explore Everest by air. The proposal was approved by the Air Ministry, Royal Geographical Society, and the government of Nepal. Lady Houston largely financed the project, which was named the Houston-Everest expedition. Two Westland biplanes were fitted out, and cameras, respiratory oxygen, and electrically heated clothing carefully selected. The base was at Purnea, 260 m. N. of Calcutta and about 150 m. from Everest. The first flight was made on April 3, 1933. Everest's characteristic plume (composed of ice particles) indicated a terrific wind, soon found to be about 110 m.p.h., but the summit was surmounted for the first time in history. Thirty-five successful oblique photographs were obtained, but the dust haze ruined all vertical survey photographs. Kinchinjunga was explored next day. A second flight to Everest was made on April 19, when vertical photographs of unexplored territory around the peak led to more accurate mapping.

**Everett.** City of Massachusetts, U.S.A., in Middlesex co. It

stands on the Mystic river 3 m. N. of Boston, and is served by the Boston and Albany rly. Its industrial activities include ironfoundry, oil refining, and the manufacture of chemicals, paints and varnishes, tools, optical goods, and leather goods. Settled 1630, it was incorporated 1870. Pop. 46,784.

**Everett.** City of Washington, U.S.A., the co. seat of Snohomish co. A port of entry on an arm of Puget Sound, it is 30 m. by rly. N. of Seattle. Situated in a mineral, lumbering, agricultural, and fishing region, it has an excellent landlocked harbour and two airports. Settled in 1862, it was incorporated as a village in 1892, and became a city in 1908. Pop. 30,224.

**Everett, EDWARD** (1794-1865). American statesman and orator. Born at Dorchester, Mass., April 11, 1794, he was for two years a Unitarian minister. He became professor of Greek at Harvard, 1819-25, and president, 1846-49. He edited the *North American Review*, 1820-24, was member of congress 1824-35, minister to

Great Britain 1841-45, and senator 1853-54, when he abandoned public life. In politics Everett was a Republican, and when the Civil War broke out he strongly supported the cause of the Union, although to the last he had hoped that war might be averted. He died at Boston, Jan. 15, 1865. His reputation chiefly rests upon his lectures and speeches. *Orations and Speeches* were published 1850-59. *Consult Life and Services*, R. H. Dana, 1865; *Life*, P. R. Frothingham, 1925.

**Everglades.** Swampy wilderness in S. Florida, U.S.A. The region is low-lying and its heavy rainfall and high temperature encourage the rank growth of vegetation, thus increasing the natural difficulty of drainage. Situated mostly in Dade co., it extends N. to S. for about 120 m. and is about 50 m. broad. During the rainy season it has a depth of 1 ft. to 10 ft. It contains a number of islands bearing cypresses, pines, palms, and vines, but is mainly a huge, almost impenetrable, tract covered with saw-grass which reaches a height of 6 ft. Projects undertaken by private firms and state and federal governments, including construction of 450 m. of drainage canals and the 140-m. Cross-Florida Waterway, have effected the reclamation of several million acres. One result is the cultivation of sugar cane, some of which reaches a height of 20 ft.; lemon, orange, and rubber trees also grow here, and lettuce, string beans, and cabbage are cultivated to some extent. The state and university of Florida have established the Everglades experimental station, where the agricultural possibilities of the region are studied. Characteristic features are the palm-thatched huts of the Seminole Indians. *See Florida.*

**Evergreens.** Plants whose leaves last several years and are not shed simultaneously. The plants are thus never leafless. The holly, for example, produces new leaves each season, but each of these lives for three or four years; therefore, although there is a leaf-fall every year, it affects only the oldest leaves and the foliage as a whole is always full and green. Evergreen leaves are of leathery consistence with glossy surface, and are thus protected against rapid loss of moisture in summer and the effects of frost in winter.

**Everlastings** or **IMMORTELLES.** Term applied to the flower-heads of certain composite plants. Their bracts are of a hard, parchment-

Everest from Mt. Phalut, Darjeeling. Over five miles high, its summit is the loftiest in the world

like character and coloured, so that if gathered in their prime, *i.e.* just before they are fully expanded, they will retain their form and colour for several years. The most striking of these are species of *Helichrysum*, *Acroclinium*, *Rhodanthe*, *Aphelaxis*, *Waitzia*, and *Xeranthemum*. After they are gathered they should be hung heads downwards to ensure perfect drying.

Everlasting Flowers  
of *Helichrysum*  
*bracteatum*

**Evershed**, SIR FRANCIS RAYMOND (b. 1899). British judge. Born Aug. 8, 1899, he was educated at Clifton and Balliol College, Oxford, and called to the bar in 1923. He was chairman of the central price regulation committee, 1939-42; controller of the Notts, Derby, and Leics coal-producing region, 1942-44; and chairman of commissions on cotton-spinners' and dockers' wages, and of a committee on supreme court practice and procedure. He was appointed chancery judge, 1944, lord justice of appeal, 1947, master of the rolls, 1949.

**Eversley**. Village and parish of Hampshire, England, 14 m. N.E. of Basingstoke. The church of S. Mary, early 18th cent., had Charles Kingsley for its rector 1844-1875. He is buried in the churchyard. Near is Bramshill House, erected for Prince Henry, son of James I.

**Eversley**, CHARLES SHAW-LEFEVRE, 1ST VISCOUNT (1794-1888). British politician.

1st Viscount Eversley,  
British politician

Born Feb. 22, 1794, he was educated at Winchester and Trinity College, Cambridge. He entered parliament as a Whig in 1830 and sat for N. Hants during 1832-57. After serving as chairman of various committees, he was elected speaker in 1839, and filled that office with distinction, reforming procedure and maintaining order in the difficult times of O'Connell and the free trade debates. In 1857 he retired, becoming Viscount Eversley. He died at Heckfield, Hants, Dec. 28, 1888. The title became extinct, but was revived as a barony in 1906 in favour of his nephew (*v.i.*).

**Eversley**, GEORGE JOHN SHAW-LEFEVRE, BARON (1832-1928). British politician. Born June 12, 1832, he was educated at Eton and Trinity College, Cambridge. As a Liberal he was M.P. for Reading, 1863-85, and for Bradford, 1885-95. He was civil lord of the admiralty in 1856; secretary to the board of trade, 1869-71; first commissioner of works, 1881-83 and 1892-93; postmaster-general, 1883-84; and president of the local government board, 1894-95. Raised to the peerage in 1906, he died April 19, 1928.

**Everton**. Parish of Lancashire, England, forming a N.E. suburb of Liverpool, and within its borough limits. Here is S. Edward's Roman Catholic College, founded 1842 and enlarged in 1875. It stands in its own grounds of 11 acres. Everton is celebrated for its toffee and its football club (*v.i.*).

**Everton**. Association football club. Founded in 1878 in a Methodist chapel, it first played in Stanley Park, Liverpool, on the opposite side of a road from the present enclosure, Goodison Park. Everton was one of the twelve clubs that founded the Football League in 1888, and except in the season 1930-31 has always played in the first division. It won the League championship in 1891, 1915, 1928, 1932, and 1939; and the F.A. Cup in 1906 and 1933. It has the unique record of gaining in three successive seasons (1930-33) the championships of the second division and first division, and a Cup victory.

**Everyman**. English morality play of the late 15th century, probably translated from its Dutch counterpart, *Elckerlijck* (printed c. 1495). The earliest known editions of *Everyman* were printed by Richard Pynson (undated, but apparently before 1531). The play, which "comprises the whole pitiful pathos of human life and death," is one of the finest examples of the moralities. The story of God's summoning of *Everyman* (all mankind represented as an individual) by Death on that journey which none may escape, and of *Everyman's* attempts to find a willing companion, is based on an earlier parable told in the religious romance of Barlaam and Josaphat (*q.v.*). A choreographic version by Mona Inglesby, with music from the tone poems of Richard Strauss, was performed by the International Ballet in 1943.

**Everyman's Library**. Name of a series of reissues of classics in ancient and modern literature of

every kind. This venture was started by J. M. Dent in 1906 and published by the firm bearing his name. Ernest Rhys was long the general editor. Each volume was given a preface by a leading authority, and by 1950 the library had reached a total of 988 out of the 1,000 which was the publishers' original aim.

**Everyman Theatre**. Theatre at Hampstead, London, N.W.3. A drill-hall close to the tube station was acquired and fitted up as a small theatre with a seating capacity of about 300. This was opened on Sept. 15, 1920, with *Bonds of Interest*, a Spanish comedy by Jacinto Benevente, and other plays notable for their intellectual appeal followed. The theatre later became a cinema at which films of special interest were revived.

**Evesham**. Mun. bor. and market town of Worcestershire, England. It stands on the Avon, 15 m.

Evesham arms

E.S.E. of Worcester, and is served by two railway lines. S. Egin founded a Benedictine monastery here in the 8th century, of which a bell tower, of fine ornate Perpendicular, and gateway still remain. The town hall is an Elizabethan structure, and the grammar school was founded by Abbot Lichfield in 1536. The battle of Evesham was fought at Green Hill; its site is marked by an obelisk. Fruit growing and market gardening are engaged in and the asparagus beds are famous. There is excellent boating on the

Evesham. Bell tower, survival of the 8th cent. Benedictine monastery

Avon. Market day, Mon. Until 1950 the town gave its name to a co. div. with one M.P. Pop. est. 11,500. About 2½ m. N.W. is Wood Norton, once the residence of French dukes, and a home of the B.B.C. early in the Second Great War. The famous and fertile Vale of Evesham is much visited in the season of fruit blossom.

**Evesham**, *BATTLE OF*. Fought Aug. 4, 1265, between the royalists under Edward, afterwards Edward I, and the baronial party under Simon de Montfort. Defections had broken Montfort's power, and in the summer of 1265 he was retreating before his foes. The force which his son Simon was bringing from the S. to join him was destroyed by Edward at Kenilworth, Aug. 1, and the elder Simon, falling back into Wales, halted at Evesham, Aug. 3. Prince Edward hastened up and cut off all chances of escape. His plans were so cleverly laid that Earl Simon exclaimed: "God have mercy on our souls, for our bodies are theirs." The royalists attacked in two divisions, and the battle was soon over. Numbers told; both Simon's horse and foot gave way, the former only after a stubborn resistance, and Montfort and his son Henry were killed.

**Eviction** (Lat. *evincere*, to overcome). Name given to the process of ejecting a tenant from a house or land. Since the First Great War severe limitations have been imposed on the right of landlords to evict tenants of houses within the Rent Restrictions Acts. *See* Distraint; Ireland; History.

**Evidence** (Lat. *evidentia*). Word used for the legal method of proving facts in a court of law. The law of evidence is one of the chief points of difference in the administration of justice between English-speaking countries and others. English courts are very strict in their admission of evidence, or rather in their exclusion of certain matters of evidence and modes of proof. The chief rules of evidence are: (1) All evidence must be relevant to the issue; (2) such relevant matters must be proved by the "best" evidence.

Relevancy is really a matter of logic. How far any given fact offered to be proved tends to prove any matter in issue is for the judge to decide. One or two things may be borne in mind. A witness's opinion (e.g. "I think the driver of the car was to blame") is no evidence. It is never relevant, except where technical matters are in dispute, and then the opinion of

skilled experts is admitted because there is no other way of arriving at the facts. The character of the parties is not relevant; if I sue a man for damages for fraud I am not allowed to call 50 witnesses to show that he is a man who has committed other frauds. All I am allowed to do is to cross-examine him as to his character, and try to drive him to admit that his record is bad. But even this is not evidence that he defrauded me.

The only time a plaintiff, or prosecutor, can call evidence of the kind above described is where the evidence shows a system of wrongdoing, and the act in issue is a part of the system—long term frauds for example. On the other hand, a man accused of crime may always bring evidence of his good character. Even in libel it is not permissible to prove misconduct by the plaintiff so as to show he has a bad character unless the defendant has justified the libel—although evidence of generally bad reputation may be given.

The rule of best evidence is a rule of exclusion. It excludes hearsay. If you wish to prove something seen or heard, you must put in the box the man who saw or heard it, and not (with certain exceptions) a man who heard that another man saw or heard it. The contents of a document must be proved by producing the document itself. If the document is, or has been, in the possession of the other side, which does not produce it after notice to do so, secondary evidence may be given. Again, if the judge is satisfied that it has been lost, stolen, or destroyed, secondary evidence is admissible. Bankers are allowed, instead of producing their books in court, to send a certified copy. There are whole classes of public documents, such as entries in marriage, birth, and death registers, wills, or bills of sale, which can be proved by officially certified copies.

These rules remain in full force for all criminal proceedings, but in civil proceedings some relaxations were introduced by the Evidence Act, 1938. Where direct evidence of a person by word of mouth would be admissible, any statement made by him in a document may be used if either he had personal knowledge of the facts or, where the document is part of a continuous record—e.g. an account book—he made entries or other statements as part of his duty and obtained the facts from someone who might reasonably be supposed to know them. The

maker of the statement must generally be called. The court may, however, admit a copy of the document containing the statement instead of the original. Statements cannot be used if made by an interested person at a time when proceedings were either pending or were anticipated.

There are long established exceptions to the hearsay rule applying to statements either oral or in writing. In pedigree cases, statements by a deceased member of the family—e.g. in a Bible—made before the litigation may be used. In all cases, declarations against interest, e.g. by a deceased person, may be admitted. In trials for homicide, declarations by the person killed are admissible to prove the circumstances of death, provided he knew that he was dying. *See* Jurisprudence; Law.

**Evidences of Christianity**, *A VIEW OF THE*. Theological work by William Paley first published in 1794, containing (1) the direct historical evidences of Christianity; (2) the auxiliary evidences; and (3) a consideration of some popular objections. Largely based on Butler's *Analogy of Religion* and Nathaniel Lardner's *Credibility of the Gospel History*, the work, in its time hailed as a crushing reply to scepticism, has come to be regarded as inadequate.

**Evil**. In the theological and ethical sense the absence of good, or unsatisfied desire. Neither definition is satisfactory. To say that evil is the absence or the opposite of good at once raises the question, "What is good?" and the answer must depend largely upon the standpoint of the individual. To define evil as unsatisfied desire pre-supposes that the desire itself is not evil. If it is, its frustration is good rather than evil. To find the supreme good in the satisfaction of desire, and evil in its frustration, ignores the possibility of a higher and external moral imperative taking precedence over mere personal desire.

From the theological point of view, the definition of evil is comparatively simple. It is that which does not conform to the Will of God. But the Will of God is manifested by both direct command and by permission. Evil, like all other things, can only exist by divine permission; and in this sense its existence is not contrary to the Will of God. But the thing in itself and the fact of its existence are not the same thing. The Will of God may permit the existence of an evil which is itself directly

opposed to that Will; and such permission in no sense makes God the author or the cause of evil.

Why evil is permitted to exist has always been a perplexing problem; and it is not greatly helped by the counter question: "Does evil exist?" If evil is a mere negation or absence of good, it has no real existence, and is nothing at all. What really happens is that the good exists in a less degree than is to be desired. The existence of so-called evil, therefore, resolves itself into this—that the universe is not perfect. Viewing evil as merely imperfection, the problem of its existence becomes less difficult. It is no reflection on the goodness of God that He is pleased to let the world progress through imperfection to perfection.

Another element in the problem of evil is that of relativity. In certain circumstances and in some relations a thing may be evil which is not necessarily evil in itself. But we are not in a position to judge the circumstances or to weigh the relations; for the simple reason that only a portion of the world of reality lies within our ken. We see only part of the machine; and those parts which appear inappropriate or superfluous may be essential or beneficial to the part of which we know nothing. See Ethics.

**Evil Eye.** Faculty of causing material harm by means of a glance. In Shakespeare, and in modern rural England, it is called *overlooking*. From its ancient Roman name *fascinum* comes the word *fascination*. Distinguishable from the subjective influence of the eyes of snakes, it denotes a form of witchcraft, owing its origin to the presumption that the eye is capable of operating at a distance. It may be exerted, voluntarily or involuntarily, upon human beings and domestic animals, especially when young, besides crops, dwellings, and other objects. Envy (Lat. *invidia*, on-looking) is a potent incentive of evil eye.

The belief is traceable to the beginnings of recorded history, and its widespread survival in primitive culture attests its primeval origin. Various curative and preventive measures are employed. Prevention is sought by spitting, muttering counter-charms, making offensive figures or gestures, giving to children opprobrious names, wearing knotted cords, or displaying amulets, many of which are specific for evil eye. They include representations of eyes, hands, horns, teeth, shells, nuts, lunar

crescents, red and blue objects, and magical or sacred texts. Evil eye is referred to by its technical name in Gal. 3, where it is translated "bewitched." The Greek belief is enshrined in the mythical gorgon Medusa, whose glance turned its victims to stone; the use of the gorgon's head as an amulet persists in doorknockers. See Divination; Magic.

**Evil-Merodach** (d. 560 B.C.). King of Babylon. The name is the Biblical spelling of the cuneiform Amel-Marduk, servant of Marduk. He succeeded his father, Nebuchadnezzar II, and after a career of tyranny and unrestraint was, within two years, violently slain by his brother-in-law, the Nergal-sharezer of Jer. 39.

**Evocator.** Any substance which, when applied to eggs in the early stages of their development, evokes responses leading to the production of recognizably differentiated tissues or organs.

## EVOLUTION: THE SHAPING OF LIFE-FORMS

\*Paul G. 'Espinasse and J. Arthur Thompson, LL.D

*This important article can well be supplemented by those on Anthropology; Biology; Life; Man; Sex. See also Cell; Heredity, etc.; and Darwin; Galton, and biographies of other biologists*

Evolution (Lat. *evolvere*, to unroll) is a process wherein one kind of living creature gives rise to another kind, which persists alongside of or in place of the original stock. Thus we believe that birds evolved from an ancient reptilian stock, and mankind from a primitive simian lineage, the origins in both cases being extinct. In the case of domestic pigeons derived from the wild rock-dove (*Columba livia*), or of poultry derived from the jungle-fowl (*Gallus bankiva*), the origins are still extant. Similarly, wild ancestors of such cultivated plants as cabbages and apple-trees still exist. The evolutionary process is going on among wild plants and animals, e.g. in some evening primroses, or in many birds and butterflies, but is not often easily detected in a lifetime or in the relatively short time since precise biological registration began.

While evolution is strictly a slow racial change in living creatures, the term is often used much more widely. Evolution should not be confused with development, which is best restricted to a continuous change in one and the same unity, such as a germ, a seed, an organ, an institution, or a solar system. Development agrees with evolution in being a series of changes in a definite direction from one position of equilibrium

Many evocators are known chemical substances and have much in common with hormones (q.v.). See Embryology.

**Evolute** (Lat. *e*, from, out; *volvere*, to roll). In geometry a curve which is the path of all points that are the centres of curvature of a second curve called the involute. To measure the curvature of any involute we find a circle which coincides with the curve for a short distance. If the curvature to be measured is great this circle of curvature can only have a small radius because it will accompany the first curve only a small way. If the curvature is small the radius of the circle will be correspondingly larger. The centre of this circle at any point on the curve is the centre of curvature at that point. It is clear that there will be a number of these circles for any curve. When their centres are all joined up they form the evolute. See Circle; Geometry.

to another, but differs from it in concerning one and the same individual system from beginning to end, whereas evolution is racial, implying a succession of generations and a sifting process. Briefly, development in biology is the individual's coming to be (Ontogeny); evolution, in biology, is the genetic history of a race (Phylogeny). Hence we should speak of the development, not of the evolution, of the earth.

Evolution may be in the direction of increased complexity and control (differentiation and integration), or in the opposite direction. A tapeworm is the result of a process of evolution just as surely as is the golden eagle within which it lives. Yet in spite of many instances of retrogressive evolution in animate nature, the general trend of the process has been progressive, i.e. towards increased differentiation and integration of fuller and freer life. This fact must never be lost sight of in contemplating the history of things as a whole.

As applied to living creatures, the evolution theory states the broad idea that the present is the child of the past and the parent of the future. The fauna and flora of today, both in themselves and in their myriad inter-relations, are the outcome of an antecedent state

of affairs in which animals and plants were on the whole rather simpler. This again originated in organisms and relations simpler still, and so on back through hundreds of millions of years, until all clues are lost, and we find ourselves in the mist of life's beginnings. The evolution theory thus states the view that the manifold intricacy of animate nature has arisen by a natural process of slow organic change, similar to that seen in the history of domestic animals and cultivated plants.

One point remains to be emphasised. The statement that living creatures have come to be as they are by evolution, only means that their history has been a natural history, the moves in which have known, or at any rate knowable, causes. To think that any result whatsoever acquires dignity, permanency, worth, invulnerability, or sanctity, because it is the result of evolution, is a misunderstanding, for the value of survival, as judged by human standards, depends on the conditions under which survival is secured.

#### Evidences of Organic Evolution

This general evolution theory, or doctrine of descent, is the only scientific way of answering the question: How has the present-day system of animate nature come into being? But while many facts of zoology and botany serve as evidences of evolution, four main lines of argument have been followed by Darwin and others.

The first is mainly anatomical. Many facts in regard to structure corroborate the evolutionist interpretation, and seem to naturalists to admit of no other. Thus, the fore-limb of a frog, the paddle of a turtle, the wing of a bird, the fore-leg of a horse, the flipper of a whale, the wing of a bat, the arm of a man, exhibit in diverse guise the same essential parts, twisted into manifold forms for different uses, but always of the same fundamental type. There is essential similarity in the important bones, and considerable resemblance in the musculature, innervation, and blood-supply. All these fore-limbs are homologous with one another, i.e. they agree in fundamental structure and development. It is difficult to understand this adherence to type except on the theory of the actual flesh-and-blood relationship of backboned animals. Many vestigial organs in animals, especially the higher animals, remain very slightly developed and are of no use; comparable, as Darwin said,

to unpronounced letters in words, the o in leopard, or the b in doubt. Man has a minute useless third eyelid and a hint of muscles for moving the trumpet of the ear. The only rational interpretation of such structures is the evolutionist one, that they are dwindling relics of structures well developed and of some functional importance in ancestral forms.

#### The Physiological Argument

The second line of argument may be called physiological. When the blood of, for instance, a horse is injected into, say, a rabbit, the rabbit makes an "anti-horse" substance which will violently and immediately attack horse blood. It will not attack the blood of a bird, but it will attack to some extent the blood of an ass. This means that an ass has blood more like that of a horse than is the blood of a bird. By modification of this experiment it is possible to gauge the degree of relationship between man and the various groups of apes and monkeys. Along with this physiological argument may be taken the abundant

evidence of the variability of living creatures. In a short time man has established over 200 breeds of domestic pigeons, which seem all to have been derived from the blue rock-dove.

Another line of argument is historical or palaeontological. From the rock record we have accumulated a great mass of material in regard to the successive appearance of horse-types, elephant-types, crocodile-types, and so forth, all reading like a lineage or pedigree. Moreover, there are many connecting links now extinct, such as *Archaeopteryx* (see Birds), which, though an indubitable bird, has several well-marked reptilian features, e.g. teeth in both jaws, a lizard-like tail, and claws on the three digits of the hand. Again, there is the big fact that in the rock record amphibians appear after fishes, reptiles after amphibians, birds and mammals after reptiles; as age succeeded age, nobler and nobler forms of life emerged.

The embryological evidence is very striking. The embryos of the higher vertebrates, viz. reptiles, birds, and mammals, develop for a considerable distance along the same road, or along closely parallel roads, before they diverge. For instance, in the neck region of the embryo higher vertebrate, there are gill-clefts or visceral clefts which have no respiratory significance, and can hardly be said to be useful, except that the first becomes the Eustachian tube connecting the ear passage with the back of the mouth. These can only be recapitulations of some of the embryonic stages of the respiratory apparatus of remote aquatic, lower vertebrate ancestors.

There was a time when the temperature of the earth was far too high to admit of the existence of

Evolution. Early and late stages in evolution. A. Early four-toed ancestor of the horse. Its proportionate size is shown by comparison with a. B. Head and skull of an early ancestor (*Meritherium*) of the elephant, whose head and skull are shown in b. C. The oldest known bird, *Archaeopteryx*, two specimens of which have been obtained from Jurassic strata, compared with c, golden eagle.

any forms of life like those we know. Whether germs of living organisms reached the earth from elsewhere, or whether very simple living organisms evolved upon the earth out of non-living matter, is unknown, but it is certain that living organisms did have a beginning upon the earth, and probable that the first organisms resembled in some respects present day viruses. Some of these may have given rise to the bacterial type of organism, consisting of a minute globule of chromatin surrounded by an organized envelope. As time went on and size increased, the chromatoglobules might increase in number and acquire some complexity of arrangement, and a non-chromatinic ground substance (cytoplasm) might become organized around them to provide a special immediate environment or fairly elaborate envelope.

#### Prototype of the Animal

A predatory organism may have arisen by the formation, around a number of chromatin-grains, of such an enveloping matrix of semi-fluid substance capable of enwrapping and digesting living particles. This was a prototype of the animal, and it preyed upon other minute creatures. Later on, the chromatin-grains congregated to form a definite cell-nucleus in the midst of the active matrix, and a true animal was formed. These suggestions serve to indicate that in all probability a long journey had to be travelled before even the first true animals or plants made their appearance.

The next great steps probably consisted in the establishment of numerous distinct types of cellular organization. On the animal line of evolution, towards which the primeval amoeboid organisms pointed, there doubtless arose all sorts of specialisations of the creeping form, many with supporting skeletal framework. More active forms had lashes of protoplasm instead of outflowing threads and lobes. Others, with an enclosing cyst, were adapted for spending much of their life passively waiting for suitable conditions, or as parasites.

One of the primeval great events must have been the emergence of green plants. These perhaps originated among flagellate infusorians on the animal line which had been able to build up the green pigment chlorophyll, the most important substance in the world, next to living matter itself. The divergence between plants and animals was one of the greatest cleavages in

evolution. While all typical animals require organic food which has been worked up for them by other living creatures, green plants are able to utilise the energy of the sunlight in their chlorophyll machinery to manufacture from the carbon dioxide of the air complex organic compounds. Thus green plants feed at a low chemical level, on air, water, and salts, and build up nutritive materials which animals utilise.

Moreover, the plant is almost always surrounded by an envelope or cell-wall of cellulose, and this restriction, taken along with the poorly developed means of getting rid of nitrogenous waste-products, may explain the tendency to fixity shown by plant-life. We are unable here to follow the evolution of the plant world which went on simultaneously with that of the animal world. One of the striking general impressions is that of a succession of dominant groups, each reaching supremacy, and then yielding to another. Thus the gigantic club-mosses and horse-tails which made great forests yielded to Cycad-like forms and thereafter passed into relative insignificance; while the Cycadophytes in their turn yielded to the flowering plants.

#### First Multicellular Organisms

It was a red-letter day in organic evolution when "bodies" began to be, i.e. when some living creatures passed possibly to the multicellular grade of organization. Many flagellate infusorians form colonies or families of connected cells, the daughter-units formed by division of the mother-unit, remaining associated, instead of drifting apart to live isolated lives, and it was probably in some such way that multicellular organisms began. It must be clearly understood that the step was not primarily one of increase in size, for a rotifer or wheel-animalcule built up of a thousand cells is much smaller than a unicellular infusorian such as *Noctiluca* (q.v.).

Nor was the step primarily one of increasing complexity either of organization or of activity, for many ciliated infusorians, though acellular, are far more complex in plasmic architecture and in ways of life than the fresh-water polyps, divided into thousands of cells. The step was on to a new line of organization, the formation of a many-celled body in which scope was given to division of labour among the component units. The structural side of this is called differentiation. The at-

tainment of a multicellular body opened the way to unlimited specialisation of function, and, partly because of the increased efficiency of execution thus attained, also to an increase of size, which, other things being equal, counts for something in a rough and callous physical environment. The nemesis of this great step of gaining a body was apparently that organisms became liable to natural death in proportion to the complexity of the bodily framework. For natural death appears to result from the accumulation of wear and tear effects, and the failure of the ceaseless attempts to cope with these.

#### Evolution of Sex

Another big step was the evolution of male and female multicellular individuals within the same species, the two sexes being complementary in the process of reproduction which secures the continuance of the race. The biological significance of the evolution of sex among multicellular animals is that it offered opportunities for new permutations and combinations of qualities, for those new departures technically called variations and mutations. The separation of sperm-producers or males and egg-producers or females, which differ deeply in constitution, would also tend to increase the range of cross-fertilisation which is often advantageous, and would permit of a profitable division of labour between the parents in their relations to the offspring.

Differentiation includes a multitude of evolutionary steps. In the creature called *Volvox*, which consists of a thousand or ten thousand flagellate green cells united in a ball, all the component units, except those concerned with reproduction, are alike. There is little or no division of labour in the colony. In sponges, however, we see the beginnings of tissues, i.e. groups of similar cells performing the same functions. Thus contractile tissue, connective tissue, and flagellate lining tissue (or epithelium) appear among sponges. In the next great series of animals, the Coelenterata, other kinds of tissue, such as nervous and glandular, are differentiated, and in them we find the first occurrence of organs, such as the sensory, the digestive, and the reproductive organs.

In most sponges and Coelenterata, the symmetry of the body is radial, i.e. there is no right or left side; the animal is the same all round. This is well suited to a sedentary or drifting existence, but

for more strenuous life involving the pursuit of prey and mates, and the avoidance of enemies, bilateral symmetry, which virtually began among "worms," is incomparably more effective. It implies a right and a left side, a head end which leads the way, and a tail end.

With the acquisition of bilateral symmetry was associated the establishment of an anterior brain and the development of a head worthy of the name. This opened up another line of advance, technically called integration, in contrast to differentiation. Differentiation means increasing complexity of parts, integration means their more perfect unification and control; and one of the main functions of the nervous system is integrative.

#### Progressive Differentiation

The story of evolution, apart from retrogressive parasites and other degenerates, is one of progressive differentiation and complementary integration, and the evolutionist has to record a long series of achievements, *e.g.* an open food canal; a body cavity or coelom between the food canal and the body wall; striped or swiftly contracting muscle; a circulatory system for distributing digested food and oxygen throughout the body and for collecting waste; oxygen-capturing pigments such as haemoglobin; a segmented body as in earthworms; a renewable external armour as in crustaceans; muscular appendages first unjointed and then jointed; specialised sense organs such as eyes and balancers, improved respiratory arrangements reaching, within their limits, extraordinary perfection among insects; delicate adjustments for filtering out the poisonous nitrogenous waste of the body.

We can only allude to the establishment of the leading type of architecture represented by the various series of invertebrates or backboneless animals. Besides the sponges and Coelenterata, we have to deal with the great variety of worm-types; with the higher segmented worms or annelids; with the starfishes, sea-urchins, and the like forming the echinoderms; with the jointed-footed arthropods, such as crustaceans, insects, and spiders; with the unsegmented molluscs without appendages, such as bivalves, snails, and cuttles; and with many smaller groups.

A step of great magnitude was the origin of the backboneed animals or vertebrates. It is not unlikely that these emerged from the stock of sea-squirts or tunicates. Their origin meant a fresh start on

a new line of more masterful life. A dominant feature was the establishment of a relatively large brain protected by a skull, and of a long, spinal cord protected by the backbone. Of great importance also was the first appearance of bone and of an internal living skeleton (usually of bone) pervading the whole body, and contributing to integration. In the establishment of numerous glands of internal secretion, whose hormones or regulative substances are distributed by the blood throughout the body, a chemical integration began to operate, or to do so on a larger scale and more rapidly.

Skulls began with the hags and lampreys; jaws and paired fins, scales and typical gills, with the true fishes; digits, true lungs, vocal chords, and a mobile tongue with amphibians; the antenatal robes (or foetal membranes) known as amnion and allantois with the reptiles. A four-chambered heart happened twice: once in the ordinary reptiles such as the crocodilians; and once quite differently and independently in another group of reptiles which, before becoming extinct, gave rise to the mammals; warm-bloodedness, or keeping the temperature of the body approximately constant, began independently in birds and mammals, which also show an enormous advance in brain development; the usually prolonged antenatal connexion between mother and offspring is carried furthest in the placental mammals.

#### Instinct and Intelligence Compared

Along with the great structural advances, there went a functional progressiveness. The smooth working that marks even the simplest creatures is not lost with intricate organization; but the scope of the life is widened and its agency becomes more free. In a sense, the behaviour of a ciliated infusorian is just as perfect as that of a bird, but the range is narrower, and the resources are fewer. The behaviour of ants and bees is extraordinarily effective on the instinctive line (*see* Instinct), and in its way unsurpassable. It cannot be profitably pitted against the behaviour of a horse or a dog, which is on the intelligent line, for its range resources are narrower. The instinctive creature is apt to be sadly non-plussed by some slight alteration in the routine of its experience. What Sir Ray Lankester has called the "little-brain" type, rich in inborn or instinctive capacities but slow to learn, must be distinguished from the "big-brain" with little

ready-made equipment, but with prodigious educability.

The big-brain type came to its own in birds and mammals, and there convincing evidence is found of an inner mental life of experimenting, *i.e.* intelligence. Interesting also is the fact that, as an organism attains to complex efficiency and to more or less intelligent mastery of its environment, it is able to practise reproductive economy. There are fewer offspring, but there is less mortality.

#### Emergence of the Human Race

In the Early Eocene age, millions of years ago, there emerged an arboreal race, the Primates, differentiated from other mammals in digits, teeth, skull, and brain. From this stock there diverged in succession the New and Old World monkeys, the small anthropoid apes (gibbon and siamang), and the large anthropoid apes (orang, chimpanzee, and gorilla). This left towards the end of the Oligocene (or perhaps in the Miocene) a generalised human stem, from which there diverged in succession *Pithecanthropus* the erect, the slouching man of Neanderthal, and the early Briton of the *Sussex Weald*—known by the famous *Pittdown* skull. None of the offshoots came to much, it seems, but the main stem continued as the stock of modern man, pieced together in relatively recent times into African, Australian, Mongolian, and European races.

With the emergence of man evolution passed on to another grade. For there are several reasons for avoiding the false simplicity of regarding social evolution as no more than a continuation of infra-human evolution. The first and chief reason is to be found in man's undeniable apartness and pre-eminence as a rational and social person. Man is differentiated by his language, by his capacity for forming and experimenting with general ideas, *i.e.* by his reason, by his vivid self-consciousness of his own evolution and by purposeful determination to control it; and by his strong kin-instincts. The second reason is the fact that in social history we have to deal with integrates of social persons, operating as unities of a higher order. The third reason is the importance of what lies outside the individual, namely, in literature and art, the folk-ways of customs and tradition, the external registrations which we call institutions. New notes are struck, and the evolution of man, though continuous with, is more than a mere continuation

of, the evolution that goes on in infra-human animate nature.

While the general idea of evolution is accepted by most naturalists, there is great uncertainty in regard to the operative factors. The uncertainty is partly due to the difficulty of arguing from a meagre experience of the present to a past of many millions of years, and partly to the fact that the inquiry is still very young, for it virtually dates from Darwin's *Origin of Species*, 1859.

There are two main problems. The first asks how the continual emergence of new things, of changes or variations which make an organism appreciably different from its parents or its kin, is to be accounted for. The second asks what directive factors may operate on the variations which arise, determining their elimination or persistence and working towards the familiar but puzzling result—the existence of distinct and relatively well-adapted species.

Some of the peculiarities or observed differences distinguishing members of the same species can be shown to be individually acquired bodily modifications directly due to some peculiarity of nurture in the widest sense. But as there is no secure evidence that these characteristics are transmitted to the offspring, they can be only of indirect importance to the race. The raw material of evolution is furnished not by these modifications, but by variations which are inborn—variations of what are called genes.

#### Fluctuations and Mutations

Among variations in structure resulting from the interaction of these variant genes with the environment, there may be distinguished minute peculiarities, and larger abrupt sports of notable amount, such as a fantail pigeon or a copper beech. The former, Darwin's "individual variations," may be usefully termed fluctuations. The sports correspond to Galton's "transient variations," Bateson's "discontinuous variations," De Vries's "mutations," and the last term should be kept for them. The transmissibility of inborn fluctuations has been proved in a few cases, and it was Darwin's conviction that "it is by the accumulation of such extremely slight variations that new species arise."

As to the origin of those minute novelties, a falling out of some feature, or a rearrangement of certain characters displayed by ancestors, it is possible to think of

them as due to the intricate permutations and combinations that occur in the history of the germinal material in the germ-cells, especially during maturation and fertilisation.

But the baffling problem is the origin of the distinctively new, where the novelty seems qualitative, not quantitative, where a new pattern, like a genius, appears. At present science cannot go beyond tentative suggestions. Many facts suggest that some environmental influences, in particular certain radiations, may act as variational stimuli on the germ-cells and provoke mutation. It is also known that one species may differ from another in the number, shape, size, and structure of its nuclear bodies or chromosomes, and just as bacteria sometimes change suddenly in their physiological properties, so the chromosomes which last on from generation to generation may change in their stereochemical architecture or functional powers.

#### Factor of Natural Selection

The most clearly discerned directive factor in organic evolution is natural selection, the process by which, in the struggle for existence, certain variants of a species, marked from their fellows by the presence or absence of some character, are on that account favoured with longer life or more successful families than their neighbours, who are therefore sooner or later eliminated. The full title of Darwin's great work should be remembered: *On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life*. He stated the gist of the theory, which Wallace had independently reached, in a couple of sentences: "As many more individuals of each species are born than can possibly survive, and as, consequently, there is frequently recurring struggle for existence, it follows that any being, if it vary however slightly in any manner profitable to itself, under the complex and sometimes varying conditions of life will have a better chance of surviving, and thus be naturally selected. From the strong principle of inheritance any selected variety will tend to propagate its new and modified form."

There are several different modes of natural selection; thus it is useful to distinguish between 'lethal selection,' which works by the discriminate elimination of the relatively less fit, and 'reproductive selection,' which works

through the increased multiplication of the relatively more fit. The operation of natural selection has been satisfactorily demonstrated in a few cases, and it is certainly a potent directive factor. To turn to a less difficult point, it is important to avoid the popular fallacy that natural selection works out the survival of the fittest in any absolute sense; what ensues is the survival of the relatively more fit to the given conditions—and this may not always imply desirability.

Yet the idea should be emphasised that natural selection operates in part in reference to a system of inter-relations which is continually becoming more complex, which is made up of many stable and beautiful and intelligent components that have stood the test of time. Therefore, natural selection does not work capriciously; we get at least a hint of the reason for its working on the whole progressively. Besides selection, some have recognised isolation as a directive factor; that is to say, all the barriers which restrict the range of intercrossing within a species. "I do not doubt," Darwin said, "that isolation is of considerable importance in the formation of new species."

#### Steady Development of Mental Processes

When we look back on the majestic process by which the present system of animate nature has come to be, certain general impressions arise in the mind. In the course of the ages there has been, in the animal world, a progressive evolution of the nervous system, an increasing elaboration of behaviour, a gradual increase of free agency, a growing emancipation of mentality. Since the beginning of life there has been on the part of living creatures an increasing appreciation and mastery of their world. To man, who is part and parcel of Nature, though also singularly apart from it, there is encouragement in the fact that we know of no reason for believing that the evolutionary process will stop.

Another highly important general impression of great interest is that while organisms are ever experimenting and tentative, proving all things, they are just as characteristically given to holding fast to that which is good. Species become extinct and races perish, but great organic inventions, such as amoeboid movement or haemoglobin or hormones, are carried on by some collateral lineage. There

is a strong power of conservation in the midst of the evolutionary flux.

As Lotze said, the process of evolution has the unity of an onward advancing melody. Retrogressions and involutions there have been and are, but the big fact is the progress to finer issues. With the growing differentiation and integration (*i.e.* complexity and control) in organisms, there was correlated some degree of external registration in the system of inter-relations gradually established. For one result of organic evolution has been the weaving of a web of life whose pattern has become more and more intricate, as in the inter-relations between flowers and their insect visitors. The complexifying of relations has probably been of great importance in evolution, for it is in reference to this external system that new organic experiments are tested and that selection works. Thus it seems that the intensification of life has been in part secured and in part prompted by the growing complexity of the external system of nature.

Thus living creatures contribute to the evolution of their kind, not only directly by exhibiting variations and by personally testing these, but also indirectly by contributing to the complexifying of the external web of life. If this be so, there is for man the hint that progressive evolution depends not merely on the improvement of the natural inheritance and intensification of the individual life, but also on the ennoblement of the external heritage—so much man's own creation—the treasures of literature and art, the tradition of high ideals, and the multitudinous linkages, many in need of amelioration, in the framework of society.

**Bibliography.** Origin of Species, C. Darwin, 1859; Darwinism, A. R. Wallace, 1889; The Causes of Evolution, J. B. S. Haldane, 1932; Evolution: Fact and Theory, H. G. Wells, J. S. Huxley, and G. F. Wells, 1934; Outline of Evolutionary Biology, A. Dendy, 1938; Evolution, The Modern Synthesis, J. S. Huxley, 1942; The Tempo and Mode of Evolution, E. G. Simpson, 1944; Animal Cytology and Evolution, M. J. D. White, 1945; Darwin's Finches, D. Lack, 1947.

**Evora.** District of Portugal, in the province of Alentejo. It is bounded on the N. by the dist. of Portalegre and on the S. by the dist. of Beja. The river Guadiana forms its E. boundary. Hilly on the N.W. and S., it slopes E. and S., forming the basin of the Degebe and smaller streams flowing into the Guadiana. A large portion of the district is barren, but there are

cork-oak forests. Evora is the capital, and Montemor and Reguengos are other towns. Pop. 207,952.

**Evora** (anc. *Ebora*). City and archiepiscopal see of Portugal, capital of Evora dist. Beautifully situated on a low hill in a fertile plain, 72 m. by rly. E. of Lisbon, it is enclosed by ancient walls and towers, has many Roman and Moorish remains, and is as interesting as it is ancient. It has a cathedral, founded in 1186, a 16th century church, an art gallery, a museum, a Roman temple, various palaces, and a famous aqueduct. It manufactures cloth, cotton, and woollen goods, and hats, and trades in wine. In the vicinity are copper and iron mines, and marble and asbestos quarries. An important fair is held annually. A stronghold of Sertorius (*q.v.*) and the capital of Lusitania under the Romans, Evora was a bishop's see under the Visigoths, taken by the Moors in 715, and recaptured by the Christians in 1166. Pop. 28,042.

**Évreux.** City of Normandy, France. It is 67 m. W.N.W. of Paris, and stands on the Iton, a branch of the Eure, in the dept. of Eure, of which it is the capital. The earliest part of the cathedral of Notre Dame dated from the 11th century and some part from the 16th. It was completely restored at the end of the 19th. Other old buildings were the church of S. Taurin, a Romanesque building of the 11th century, to which an abbey was at one time attached, the episcopal palace, and the belfry. The hôtel de ville, museum, public library, and botanical gardens were notable. There are some small manufactures and a considerable agricultural trade.

Évreux was frequently besieged and taken in the wars between England and France. At Vieil Évreux, 4 m. distant, extensive remains of a Roman theatre, baths, aqueduct, etc., have been unearthed. In the Middle Ages, the counts of Évreux were powerful nobles; the dignity was given in 1427 to Sir John Stuart of Darnley, a Scot in the French service. The English family of Devereux takes its name from here. In the Second Great War, on June 13, 1940, Évreux was bombed by the Germans, who occupied it shortly afterwards. U.S. troops liberated the town on Aug. 23, 1944. Pop. 20,436.

**Evzones** or **Evzones.** Greek troops. They bear a variant of the name given to troops in the times of ancient Greece, *Euzonoi*, mean-

ing well-girdled, and so girt up for fighting. They are light troops consisting normally of about six battalions, and from their dress are known as the Greek Highlanders. Their uniform consists of a white kilt or *fustanella*, wide-sleeved white shirt, embroidered vest, red-pointed shoes, and blue-tasselled red cap. The Evzones fought in Macedonia and Serbia in the First Great War, and in the Second distinguished themselves against the Italians in Albania and against the Germans in Greece.

**Ewald, CARL** (1856-1908). Danish novelist. Born in Slesvig, when a child he removed with his family to Copenhagen after the annexation of the duchy by Germany. He started in active work as a forester, but turned to novel writing, in which he won distinction. In *The Old Room* he depicted a rebel against orthodox life, and in *Cordt's Son* his opposite in a strict observer of the conventions. Several of his stories have been translated into English by Teixeira de Mattos, notably *Two-Legs and Other Stories*, 1907; *My Little Boy*, 1908; and *The Pond and Other Stories*, 1909. *Pron.* Ayvahlid.

**Ewald, GEORG HEINRICH AUGUST VON** (1803-75). German Biblical critic and Orientalist. He was born Nov. 16, 1803, at Göttingen, where

Heinrich Ewald,  
German scholar

in 1831 he became professor of Oriental languages and philosophy. In 1838 he was appointed to the chair of Theology at Tübingen, and in 1848 returned to Göttingen, where in 1867 his retirement came about through political complications. His numerous works include a Hebrew Grammar, 1827, but the most important was his *Geschichte des Volkes Israel*, 1843-59. His criticism was cautious, and he exposed the extreme views of the Tübingen school. He died May 4, 1875. *Pron.* Ayvahlid.

**Ewald** or **EWALD, JOHANNES** (1743-81). A Danish poet, born Nov. 18, 1743, at Copenhagen. Yearning for change and adventure, while still a student at Copenhagen university he joined the army of Frederick the Great, then engaged in the Seven Years' War, but later deserted to the Austrians. In 1760 he returned to Denmark and resumed his studies. A cantata written in 1766 on the death of Frederick V of Denmark

placed him in the front rank of lyric poets; but his drama, *Balder's Death* (1773), in which he introduced the old gods of Scandinavian mythology, first ensured his fame and gave an immense stimulus to the national pride in the legendary past of Denmark. George Borrow's English translation of this was published in 1889. Other well-known works are *Adam and Eve*, 1769, and *The Fisherman*, 1778. Ewald died March 17, 1781. His *Collected Works*, ed. H. Brix and V. Kuhr, appeared in 1941.

**Ewbank**, THOMAS (1792-1870). British author. Born at Barnard Castle, March 11, 1792, at the age of 13 he was apprenticed to a plumber, and in 1812 obtained employment in London as a labourer. He emigrated to America about 1819, and started a metal tube manufactory in New York, from which business he retired in 1836. After travelling in Brazil, 1845-46, he published his *Life in Brazil*, 1856. Ewbank was commissioner of patents 1849-52. The remainder of his life was largely spent in writing on engineering subjects. He died in New York, Sept. 16, 1870.

**Ewe** (Lat. *ovis*, a sheep). Word used for the female of the sheep (*q.v.*) and of other animals.

**Ewé**. African language-group. Mostly found in Dahomé, S. Togo-land, and the Gold Coast Colony, it forms part of a primitive W. Sudanic speech once widespread in the Guinea region before the advent of Bantu influences. Of the Ewé speaking peoples the chief tribes in French Africa are the Dahomé and Mahi; the tribes in British Africa include the Awuna, Agbosomi, and Krikor, E. of the Volta river. The racial type tends to be shorter, fairer, and rounder-headed than that of the true negro.

**Ewell**. This town of Surrey, England, is part of the borough of Epsom (*q.v.*).

**Ewell**, RICHARD STODDERT (1817-72). American soldier. Born at Georgetown and educated at West Point, he fought against the Mexicans and Indians, but on the outbreak of the Civil War resigned his commission to fight for the Confederacy, and took part in both battles of Bull Run, Antietam, Chancellorsville, Gettysburg, and others. In the closing days of the war, on April 6, 1865, Ewell and his force were captured by Sheridan at Sailor's Creek. He died at Springfield, Tenn., Jan. 25, 1872.

**Ewer**. Pitcher or jug with a wide mouth. It is used particularly for holding water for toilet

purposes. The word is a corruption of Lat. *aquarium*, watering place; cf. Fr. *eau*, water. See *Damascening* illus.

**Ewing**, ALFRED CYRIL (b. 1899). British philosopher. Educated at University College, Oxford, he was assistant lecturer in philosophy at Swansea university, 1927-31, and was then appointed lecturer in moral science at Cambridge. His publications included *Kant's Treatment of Causality*, 1924; *The Morality of Punishment*, 1929; *Idealism*, 1934; *Reason and Intuition*, 1941.

**Ewing**, SIR JAMES ALFRED (1855-1935). British physicist and engineer. Born at Dundee, March 27, 1855, he was educated at the high school and at Edinburgh university. Until 1878 he assisted Lord Kelvin, and during 1878-83 was professor of mechanical engineering at the Imperial university of Tokyo, where he studied earthquakes. During 1883-90 Ewing was professor of engineering at University College, Dundee; and of mechanism and applied mechanics at Cambridge, 1890-1903. He became a member of the ordnance research board in 1906, having been since 1903 director of naval education. In 1916 he became principal and vice-chancellor of Edinburgh university, resigning 1929. Among his important inventions were: magnetic curve-tracer, hysteresis tester, and a permeability bridge, all used in testing the iron employed in making dynamos and transformers. He was knighted in 1911, and died Jan. 7, 1935.

**Ewing**, JULIANA HORATIA (1841-85). British writer of stories for children. She was the daughter

Juliana H. Ewing,  
British author

of Alfred Gatty, vicar of Ecclesfield, Yorks, and the wife of Major Alexander Ewing. Among the pleasantest of her tales are *The Land of Lost Toys*, 1869; *A Flat Iron for a Farthing*, 1873; *Jackanapes*, 1884; and *The Story of a Short Life*, 1885. She died May 13, 1885.

**Ewins**, ARTHUR JAMES (b. 1882). British chemist. Born Feb. 3, 1882, he was educated at Alleyn's school and London university. In 1899 he entered the Wellcome physiological laboratories as assistant. Research chemist in 1917 to May and Baker,

Ltd., he later became director of research, and in 1932 discovered with Dr. M. Phillips the drug M. and B. 693.

**Examination**. Method of discovering the qualifications in certain stated respects of persons submitting to it. Examinations may be designed to test personal qualities or knowledge or skill or understanding. In some form they are, and will probably always be, an important part of the procedure of social selection. In 20th century education, examinations of a more or less formal character affect considerably the type of school the individual attends, the type of instruction he receives there, the record with which he leaves school, his eligibility for various forms of further education, his right to follow a particular occupation, his success in applications for employment, or his eligibility for promotion. One of the commonest forms of examination is the competitive interview. It is also one of the most difficult to systematise and to make objective and reliable as a means of measurement.

Practical men throughout the ages have in their own way assessed the qualities and suitability of prospective employees. Formal methods of examination developed first at the universities, in order to judge the relative attainments of scholars and their fitness to teach and later to practise one of the learned professions. But as the title "senior wrangler" (Cambridge university) indicates, the examination originally took the form of disputation, the candidate having publicly to answer questions and to argue and maintain a thesis against the cross-questions of the examiners. Subsequently, questions were dictated to supplement the oral questions and answers, but there is no record of any written examination questions in Europe earlier than the 18th century. In the 20th printed question papers are in many cases supplemented by oral, or *viva voce*, examinations. More often, however, the examination is conducted wholly by printed question papers, and the candidate's written answers are the only link between the examiner and the candidate, the sole data by which the examiner judges. This fact has given rise to widespread criticism of the examination system.

It is argued:

(a) That a candidate's performance in such an examination is dependent too much on his

physical condition at the time, particularly his nervous condition, and on his command of words; further, on the accident of the examiner's choice of questions, which cannot exhaustively test an elaborate syllabus;

(b) That in any case the examination shows only whether the candidate knew certain things at a certain time, and does not reveal whether or not the knowledge or the skill manifested is permanent;

(c) That examination syllabuses encourage teachers to become "crammers" and to concentrate rather on imparting facts that may be useful in the examination room than on developing the pupil's capacity to use his mother-wit; and that, in particular, in the grammar schools of the country the requirements of examination syllabuses dominate the work of the school and stunt the wider mental and aesthetic development of the pupils;

(d) That the normal examination paper cannot provide an objective measurement of the candidate's performance, the marks awarded being to a large extent a reflection of the idiosyncrasies of the examiner.

Many committees have considered and reported on the examination system, and proposed, for example:

(a) That the results of written examinations should be only supplementary to the student's educational record;

(b) That examination papers should consist of a great number of short questions (say 100 or more), each of which can be answered correctly in only one way, so that the examiner's predilections have no scope and the whole syllabus of study can be reasonably covered by the questions set;

(c) That the leaving certificate examinations of secondary schools should be completely divorced from the examinations for university entrance (matriculation), and should be conducted wholly by the school and the teachers concerned with the students' work, so that the teachers may be free from the constraint of syllabuses imposed from outside.

In 1931 an international inquiry into examinations was organized under the auspices of the Carnegie foundation and the International Institute of Teachers' college, Columbia university. Separate committees investigated examinations in England, France, Germany, Scotland, Switzerland,

and the U.S.A. The English committee published in 1936 a short report, *An Examination of Examinations*. This showed clearly that a large element of chance entered into the results of some important types of examination, such as the school certificate examinations, taken by more than 60,000 pupils annually; the entrance examinations by which about 400,000 children were transferred from the elementary to the secondary school at 10 to 12 years; university college scholarship examinations, and university honours examinations; further, that the conventional type of written examination was by no means a rigid yard-stick; and that methods of examining could be improved. Little change of method developed, however.

Attempts have been made to evolve a technique of examining that would reveal and measure the quality and distinctive characteristics of a person's intelligence and personality, and thus indicate his potentialities and his special aptitudes rather than his current attainments in certain directions. Such methods were used during the Second Great War to classify recruits to the U.S. and British forces, and particularly to select men and women for commissions. The U.K. War Office Selection Board (W.O.S.B.) methods were adopted by some of the larger business houses in the selection of their personnel, particularly those intended for senior executive posts. The National Institute of Industrial Psychology, London, was closely associated with this development.

Intelligence tests, aiming at an assessment of an individual's educability, are a common method of classifying pupils. Tests of mechanical aptitude are often imposed on junior applicants for employment to discover, before they begin training, whether they are likely to develop reasonable skill in special clerical or industrial processes.

See Civil Service; Education; Intelligence Test; Profession; Psychology; School; University. Consult *An English Bibliography of Examinations, 1934*; *An Examination of Examinations, 1936*; *Essays on Examinations, 1936* (all published under the auspices of the International Institute Examination Enquiry); *Aptitudes and Aptitude Testing*, W. V. Bingham, 1937; *Handbook of Commercial and Technical Education*, ed. H. Downs, 1939.

**Examiner of Plays.** British official created in 1737, when the lord chamberlain became responsible for the licensing of plays and appointed an examiner to act as his reader. The statutory authority rests with the lord chamberlain; the examiner has no legal existence. Nevertheless, by the end of the 19th century the examiner had become, in effect, a dictator in the theatre. His opposition to the intellectual revival towards the close of the 19th and at the opening of the 20th century, his banning of plays by Ibsen, Maeterlinck, and Shaw, resulted in the appointment of a select committee of both houses of parliament to consider the question of dramatic censorship. As a result of their report reforms were carried out, the duties of an examiner being henceforth restricted to reading, reporting, and advising on the plays submitted for licence.

**Exarch** (Gr. *exarchos*, leader). In Byzantine history, a title specially applied to the military governor of the district of Ravenna in Italy. The exarch has been compared to the viceroy of India. The direct representative of the emperor, he commanded the troops, controlled the civil administration and finance, and influenced ecclesiastical affairs. The exarchate of Ravenna lasted 584-752.

There was also an exarch of Africa, the earliest mention of whom occurs in 591. The name exarch was also given to a dignitary of the church who held a position below that of the patriarch, but above that of the metropolitan, and to the head of certain monasteries, and survives as the title of the patriarch of Bulgaria.

**Excalibur.** King Arthur's magic sword; called Caliburn and made in the isle of Avalon. In the *Morte d'Arthur* the king takes the sword from the hand of the Lady of the Lake, and learns that its name signifies Cut-Steel, and that while he has the scabbard he can never be sore wounded and cannot lose blood. When stricken down in the final battle, Arthur commands that the sword be thrown into the lake, where it is caught by a hand and vanishes. See *Morte d'Arthur*.

**Excambion.** Term used in Scots law for an exchange of lands. The law allows this to be done in the case of entailed property, as well as unentailed, several statutes to this effect having been passed. It is often done to make boundaries and other divisions of property more convenient.

**Excavator.** Machine for the removal of soil. Except in small jobs or where confined quarters render mechanical excavation impracticable, excavation is done by various types of machine. It is a preliminary operation to building, and involves clearing the site, digging out the foundations, digging trenches for drains, etc. Excavation is also carried out in mining and quarrying: in open-cast mining for coal, for example, the "overburden" (overlying soil) is stripped from the coal deposit by the shovel or drag-line. In quarries, sand pits, and gravel pits and brickworks, the material is dug out with the shovel; the same machine is used for road and railway construction, and the excavation of tunnels. In general the shovel is the appliance for excavation work above ground level.

The shovel comprises the base machinery, with boom, dipper-stick or sticks, and dipper. The last, which is the digging or shovelling member, is attached to the dipper-stick and has a flap bottom door retained by a latch; the door is released to dump the load. Upward and downward movements of the dipper and handle are controlled by the hoist-rope and brake.

The drag-line is used for digging below the ground level on which the machine stands, and operates even if water be present in the workings. Hence its employment for canal and drainage work. There is a wide range of sizes, with capacities of from  $\frac{1}{4}$  cu. yd. to 20 cu. yds., and with boom lengths of 25-225 ft. The boom is usually of lattice steel construction, a bucket being suspended from it by a hoisting rope. A drag-rope passes through a fairlead on the front of the revolving superstructure and is attached to the drag-line bucket.

The machine's digging action is obtained by lowering the bucket towards the base of the excavator until it rests on the ground, and pulling it by means of the drag-rope. Teeth on the bottom of the front part of the bucket penetrate and scoop the soil during this action. The load in the bucket is tipped by slacking off the drag-rope; a tipping rope assists this operation.

Where the soil is too heavy to be dug effectively by a drag-line, a drag-shovel is used; it is used also for digging below ground level when the excavation is not too deep. Particularly suitable for trenching work, it has the qualification of the drag-line with

the advantage of the shovel, the dipper being held rigidly to its cut. In principle the machine is a shovel in reverse, except that the dipper-stick is pivoted to the top of the boom, and the dipper is fastened to the end of the stick facing back towards the machine. The drag-shovel can excavate trenches to 25 ft. Skimmers and drag-shovels often have a common boom.

The skimmer takes shallow cuts from the surface. It consists of a box-section boom along which the skimmer-bucket slides in a horizontal direction away from the machine. Its use is limited to shallow excavating. The prising action of the bucket teeth breaks up ground, and the machine can also load the material. During digging, the boom is kept horizontal or at the grade desired, and the bucket is pulled along the boom until full. Then the boom is lifted and rotated to the dumping position required, where the load is discharged by unlatching the pivoted bottom of the bucket. The radius of action is as much as 30 ft. without moving the machine.

The grabbing crane or clamshell is mainly used for handling loose material, though sometimes for excavation. Universal machines

Excavator: appliances used in different situations. 1. Electrically driven 4 cu. yd. quarry shovel. 2. Walking drag-line, much used in canal and drainage work. 3. Thirty-three cu. yd. shovel, one of the largest types of excavator. 4. Drag-shovel excavating a deep trench. 5. Skimmer engaged on levelling work. 6. Half-yard shovel on creeper track.

are excavators (generally not exceeding 1 cu. yard in capacity) which have a common base machine, usually powered by a Diesel engine, and various types of digging equipment. They can readily be converted to shovel, drag-line, drag-shovel, skimmer, grabbing crane, or lifting crane.

The name front-end equipment describes the digging attachment fitted to the base machine to perform various kinds of work. The base machine generally comprises a friction-clutch-operated superstructure with two rope drums, powered by a Diesel engine, petrol engine, or electric motor. Means are provided to rotate the superstructure on the travelling base. Base machines are usually caterpillar-mounted and are extremely mobile.

**SOIL MOVING AND TRANSPORTING.** Soil dug out by excavating machines must usually be removed by ancillary equipment such as dumpers and trucks. In surface work such as road making or the levelling of an area for an airfield, much of the actual trimming and contouring is done by bulldozers, scrapers, and graders. Once the surface soil is loosened by scarifiers which rip up the earth, the latter can be pushed along bodily by a bulldozer: this is a scoop-like shovel fixed at the front of a Diesel-engined tractor-like vehicle, usually on caterpillar track. The soil fills the blade or bowl and the material in front is pushed along as the bulldozer advances. The bulldozer can also push soil to one side of a road being constructed; in an angledozer, the blade is set at an angle to the line of travel of the vehicle, and so thrusts the soil to one side. Soft soil can be dug by these appliances.

The scraper removes soil as it traverses the area. Some forms load the soil into a receptacle as they go; others, like the bulldozer, push some material ahead, and carry more soil in the scoop or pan. The grader is used to form slopes or to shape the crown of a road, etc. In one type the soil moved by the blade is carried to the belt of an elevator forming part of the machine, and is discharged at the side, clear of the roadway, canal bed, etc. Dumpers (*q.v.*) receive material from the excavating shovel or other digging appliance and carry it to the unloading point.

**PUMPING, ETC.** Excavation in permeable ground, where heavy inflows of water are expected, requires special methods. An in-

dependent system of pumping to depress the level of the groundwater is often installed; cylinders and cofferdams are constructed by sheet piling. Compressed air is used in tunnel excavation and where the hydrostatic head does not exceed 100 ft. Other methods include grouting processes whereby the injection of chemicals or cement has the effect of solidifying the ground whilst excavation is in progress. An alternative to compressed air, particularly in shaft sinking is the freezing process, whereby chilled brine is circulated through small tubes lowered into boreholes surrounding the site, and so gradually forms an impermeable membrane in the shape of an ice wall. This process, however, is expensive, and, moreover, a long period elapses before the soil is frozen.

**Excellency.** Title of honour, formerly applied to emperors, kings, princes, and other high personages. In modern British usage it is confined to the governors of dominions, colonies, and Northern Ireland, and ambassadors and envoys. In France and the S. American republics the president is styled Excellency, but not in the U.S.A.; and in Continental countries it is often applied to cabinet ministers. The Italian *eccellenza* is a common mode of addressing strangers.

**Excellent, H.M.S.** Chief school of gunnery for the Royal Navy. It is situated on Whale Island, Portsmouth. Whale Island is largely artificial, having been built up from earth excavated during the construction of Portsmouth dockyard. Officers and men are trained as specialists in all branches of naval artillery.

**Excelsior.** Lyric poem by H. W. Longfellow, published in *Bal-lads and Other Poems*, 1841. It is intended to show the life of a man symbolised in an Alpine climber, resisting all temptations, laying aside fears, heedless of warnings, and pressing right on to accomplish his purpose. After every warning, in the face of every temptation, he repeats *Excelsior*, higher; and then perishes without having reached the perfection he longed for. The voice heard in the air at the close promises immortality and progress ever upward.

**Excess Profits Tax.** Tax introduced by the British government as a war measure in 1939. It was then levied at 60 p.c., but was raised in May, 1940, to 100 p.c. of profits earned by a commercial undertaking in excess of those of a pre-war standard period. The National Defence Contribution was an alternative, the taxpayer being liable for whichever was higher. Between 1940 and the end of the war in 1945, E.P.T. realized over £1,600 millions. The tax was lowered in Dec., 1945, to 60 p.c., and at the end of 1946 it was repealed. In certain cases rebates of 20 p.c. were made to firms wishing to expand their business.

In Sept., 1915, an Excess Profits Duty was imposed by the British government to help meet the cost of the First Great War. Profits in excess of the average made in the years 1912-1914 were dutiable at the rate of 50 p.c., raised to 60 p.c. in 1916 and 80 p.c. in 1918. Duty was not charged on the first £200 of excess profits, and farmers and professional men were exempt. The duty was abolished in March, 1921. *See Taxation.*

## EXCHANGE: BASIS OF FOREIGN TRADE

F. A. Willman, Expert in Banking and Currency

*This article describes the essential functions of foreign exchange in international trade, both when free and when under government control. See also Economics; International Monetary Fund; Money; etc*

Exchange (*Lat. ex, out; late Lat. cambiare, to change*) comprises transactions of international finance. Since nations maintain different currencies, every transaction of international trade or finance involves the changing of the purchaser's currency into that of the seller. Thus, if an Englishman buys wheat from Canada, and employs a Canadian lawyer to advise him on some point of law connected with the deal, his pounds must be exchanged into Canadian dollars to pay the farmer for his wheat and the lawyer for his services, since pounds

are not the currency of Canada. Similarly, if an Englishman receives money from France, the French francs must be changed into pounds before they can be spent in England.

In practice, one currency is exchanged into another by banks, assisted by brokers. Thus, the purchaser of Canadian wheat draws a cheque on his bank in pounds, but the bank pays the Canadian exporter in dollars. To collect a debt due from a Danish importer, an English exporter hands his bank a bill of exchange against which the bank—through

its agent, also a bank, in Copenhagen—collects kroner, which are converted through the banks into pounds.

Exchanges of this kind are possible because banks in every civilized country maintain accounts with banks abroad, such accounts being reckoned in the currency of the country in which they are held. Thus, from its dollar account in Montreal the English bank pays for Canadian wheat, and to its kroner account in Copenhagen the Danish kroner are credited. Banks are, then, both "buyers" and "sellers" of foreign currencies of all kinds, and this side of their business effects the transfer of funds from one country to another and the exchange of the currencies involved. Many thousands of such transactions are conducted daily, and the relationship of one currency to another varies with the trade position of the countries involved.

#### Method of Publishing Exchange Rates

Exchange rates are published daily in the principal newspapers. In Great Britain some (e.g. dollars, francs, kroner) are given as so many units of the foreign currency to £1 sterling, others (e.g. the Indian rupee and the Chinese dollar) as so many pence, or shillings and pence, to one foreign unit. The only reason for this is custom. Rates may vary from one day to another. The dollar rate, for instance, may be 4.02½ (four dollars two and a half cents) one day and 4.02¾ the next. Again, rates vary according to the time factor. To pay a Canadian exporter by cabled instructions, a bank may quote 4.47 (four dollars forty-seven cents) to £1, which will be the telegraphic transfer (or T.T.) rate, while to pay by post it might quote 4.47½, the mail transfer (or M.T.) rate, ruling at the time.

Exchange rates between countries using the same nominal currency unit are also given; for example, Great Britain, Australia, New Zealand, and S. Africa all use the pound. In these cases the quotation is usually given as the number of Australian (or New Zealand or S. African) pounds which will be paid in Australia (or New Zealand or S. Africa) for £100 paid in London.

Just as the settlement of debts arising from goods sent from one country to another and services rendered by citizens of one country to citizens of another causes a demand for foreign exchange, so do a variety of financial opera-

tions, such as the making of loans and the payment of interest on them, travellers' expenditure abroad, the investment of funds through a foreign stock exchange. Severe changes in the internal price level of a country, by discouraging or stimulating foreign trade, affect the exchange value of its currency; while a government can arbitrarily raise or lower the value of its currency in relation to that of other countries.

The ideal is a stable exchange rate, for changes involve adjustments in price of imports and exports. Frequent changes discourage trade, since manufacturers and other business men can plan ahead with confidence only when they can be sure that exchange rates will remain stable, or very nearly so. Severe and frequent changes in the value in terms of other currencies of the currency unit for a country with considerable international trade leads to world-wide economic chaos.

Before 1914 many nations adhered to the gold standard, under which their currency had a fixed value in terms of gold. There were no restrictions on the export and import of gold, and when a banker was short of any particular foreign exchange he shipped gold abroad, in coins or bars, receiving in exchange its fixed value in the foreign currency he needed. The English gold sovereign contained 20s. worth of gold; the gold in a French louis d'or and an American eagle was equal to the face value of the coin, and so on; one gold sovereign was always worth 4.866 American gold dollars, and the value of the American dollar in London could not move much below that figure, less the cost of shipping and insuring the metal.

#### Breakdown of Gold Standard System

The First Great War broke many delicate international mechanisms, among them the gold standard system of exchange. Gold ceased to be in general use as coin except in some gold-producing countries (e.g. S. Africa and the U.S.A., which did not go off the gold standard until 1933). This would not have mattered in itself, since gold is almost as much a token of value as is a pound note or a dollar bill, and the value attached to it is almost as arbitrary; but political upheavals, economic disasters, war destruction, and a general lack of appreciation of the need for stability of exchange led to a period of uncertainty in international financial transactions,

precipitated into chaos by the deliberate devaluation of their own currency by some governments, notably that of the mark by the Germans (to evade payment of reparations).

In an attempt to recreate stability, Great Britain in 1925 returned to the gold standard (though she did not again mint gold coins for her own use); but other countries did not, in many cases could not, follow suit, and she went off gold once more in 1931. The British government then set up an exchange equalisation fund with which the Bank of England "bought" or "sold" foreign currencies abroad when market conditions would otherwise have caused severe exchange rate changes. Other governments adopted a similar expedient.

#### Attempts to Control Exchange Rates

Schemes instituted abroad for the control of foreign exchange dealings in an endeavour to offset the effects of the world depression of the 1930s included clearing agreements, special accounts, and other bi-lateral arrangements which sought to canalise the foreign exchange arising from transactions between two or more countries, and thus to facilitate particular trade relations. Elsewhere, while trade transactions were permitted to pass through the normal exchange channels, those of a capital nature, such as the sale of foreign capital assets, were "blocked," i.e. were forcibly retained in the country in which the assets were sold. Even agreements for direct barter were made to reduce the demand upon the available foreign currency.

When the Second Great War began, Great Britain was obliged to concentrate her industry on production for war needs, and was unable to produce anything approaching the quantity of goods she normally sold abroad. In consequence, the supply of new foreign currency becoming due to her was limited, and she introduced strict control of foreign exchange in order to conserve what capital assets she had and what she could earn, particularly in the form of American dollars, for purchases essential to the prosecution of war, thus preventing them being spent on inessentials. Except for dealings within what was termed the sterling area, an area consisting, broadly, of the British Empire (except Canada and Newfoundland) and mandated territories, plus certain countries which for trade or political reasons, elected

to base the value of their currency on the value of the £1 sterling instead of on the dollar, all dealings involving expenditure in foreign currency were subject to licence; while all foreign currency earned by exports or services, accruing from the sale of foreign investments or in any other way, had to be offered to the Bank of England, for which, both as regards expenditure and collection, the ordinary banks acted as agents. This system not only ensured the best use in the national interests of available foreign currency; it also enabled the Bank of England to fix and enforce agreed rates of exchange.

The desirability of stable exchange rates was by this time very widely appreciated, and a United Nations plan, drawn up at Bretton Woods (*q.v.*) in 1944, and accepted by Great Britain in 1945, proposed to stabilise them after the war by the establishment of an International Monetary Fund. See *N.V.*

**Exchange.** Building wherein brokers, merchants, and bankers meet for the transaction of business. Those whose business it is to buy and sell stocks and shares meet at the stock exchange; the principal market place for rubber in London is referred to as the rubber exchange; metals were, until the Second Great War, dealt in at the London metal exchange; while Lloyds remains the principal exchange in the world for the transaction of shipping insurance. Occasionally, as in the Baltic Exchange, the business dealt in is determined by the geographical distribution of the interests involved rather than being confined to a particular commodity. Most English market towns have a corn exchange which is the meeting place of farmers and those who either buy crops or supply such of their needs as fertilisers, seed, and feeding stuffs. See *Stock Exchange*.

**Exchange.** Legal term for the exchange of one piece of land for another by mutual arrangement; or, in ecclesiastical law, the exchange of one living for another by the respective incumbents. The former transaction must be signified by a deed of exchange.

**Exchange Equalisation Fund.** Instituted by the British Government in 1932. Adherence to the gold standard provided foreign exchange dealers with an alternative, at a fixed price, to their normal purchasing or selling of foreign currencies, and thereby restricted

the fluctuations in the rates, or prices, of these currencies. Abandonment of the gold standard left a country with the choice of artificially restricting dealings in its currency, as by requiring all purchases and sales to pass through a central bank on the terms which that bank decides, or providing a fund by means of which operations could be conducted officially in the ordinary market to offset fluctuations arising from abnormal changes in supply and demand. The same fund could be used also to influence rates of exchange in accordance with current government economic policy.

Those were the purposes of the British Exchange Equalisation Fund which was set up to control the foreign value of sterling after the gold standard was abandoned in 1931. Its assets consisted of sterling funds, gold, and foreign currencies; in 1933 they totalled £375 millions. Within four years the authorised limit of the fund was raised to £575 millions to meet the demand upon its services, and on the outbreak of the Second Great War all limitation was removed. To existing assets there was then added some £263 millions of gold hitherto held by the Bank of England for note cover, and thereafter until the introduction of Lease-Lend (*q.v.*) the fund was used mainly as a means of purchasing abroad munitions of war.

**Exchequer.** Name given in England to the department entrusted with the duty of receiving the royal revenues. The word means a chess board because it was by means of a device of this kind that the early accounts were kept. The late Lat. equivalent is *scaccarium*, and the *Dialogus de Scaccario*, a treatise of the time of Henry II, gives most of our existing information about the early exchequer. The sittings were held at Winchester and then at Westminster.

The early kings had both a treasury and an exchequer, and the functions of the two have been somewhat intermingled even until the present day. The *Dialogue* tells how the exchequer met, the justiciar, treasurer, chancellor, and other high officials with their clerks attending its meetings, how the receipts were entered on rolls, and how tallies were used in this connexion. It met twice a year, at Easter and Michaelmas, and its main dealings were with the sheriffs who attended to account for the royal revenues which they had collected or failed to collect. In

addition to this court there was a lower exchequer, which was a permanent department and in practice a branch of the treasury.

Gradually certain changes were introduced. The treasurer took the place of the justiciar as its president, and then these high officials ceased to attend its sittings in person. The seal, hitherto held by the chancellor, was given to a new official, and the chancellor of the exchequer came into being. The chief members were known as barons, and they began to hear cases affecting the revenue, resolving themselves into one of the regular courts of law, the court of exchequer, with a court of appeal, the court of exchequer chamber, which existed from 1357 to 1830.

As the country became richer, the duties of the exchequer grew. It dealt not only with the accounts of the counties, but with others which concerned the royal revenue. The exchequer continued in existence until the 19th century. It collected and paid out the royal income and expenditure, while its five barons, under a chief baron, heard cases as a court of law.

In 1834 great changes were made, the old exchequer being practically abolished, the paymaster-general taking over its duties. A new exchequer was set up, but this was an audit office, and in 1866 the present exchequer and audit department was established. The name exchequer remains in several connexions, exchequer bonds, etc., but the main financial work of the country is done by the treasury, whose actual head, however, is the chancellor of the exchequer, and not the first lord of the treasury. The court of exchequer lasted until the legal reforms of 1876.

Scotland and Ireland had each their exchequer and their court of exchequer on the English model. The union of both kingdoms with England made these separate institutions unnecessary, although the Irish exchequer lasted until 1817, and the Scottish court of exchequer until 1856. See *Chancellor of the Exchequer*; *Treasury*.

**Exchequer and Audit Department.** Government department under the comptroller and auditor-general. His business is to see that all public money is expended in accord with the wishes of parliament. Without his authority no money is paid out of the exchequer. He is also the national auditor, bound to notify any irregularities in his annual report to the house of commons. The office,

established in 1866, took over the duties formerly discharged by the comptroller-general and the commissioners for auditing public accounts. The official can be dismissed only at the request of both houses of parliament. His offices are on Victoria Embankment, London.

**Exchequer Bonds.** British Government security originally issued in 1853 in the form of promissory notes repayable in three to five years. These bonds constituted a common means of government borrowing until after the First Great War, during which issues were made at 3, 5, and 6 p.c. In 1920 an issue was made at 5½ p.c. In 1944, the exchequer bond was revived as a means of raising money for the Second Great War. The rate of interest was, however, 1½ p.c., and the old promissory note form in favour of the bearer was discarded, so that the issue became a government stock in the same way as, for example, war loan, the lender's name appearing on his certificate and the stock being bought and sold on the stock exchange in the usual way. The issue of 1944 was repayable in 1950, but in that year was converted into 2½ p.c. exchequer stock payable in 1955. In 1946 holders of 2½ p.c. Conversion Loan 1944-49 and 2½ p.c. war bonds 1945-47 were offered the right, in lieu of accepting repayment, of converting them into a like amount of 1½ p.c. exchequer bonds.

**Exchequer Grants.** Contributions made by the exchequer annually under the Local Government Act, 1929, to county councils and county boroughs for local government expenses. A general exchequer contribution is made to a central fund and the latter is apportioned among the counties and boroughs. The grant was originally intended to compensate local authorities for the loss of rates suffered through the de-rating of agricultural land and of industrial and freight transport hereditaments—e.g. rlys.—in 1929.

• **Excise.** Excise duties are taxes levied on goods produced and, more recently, services rendered, within a country; as distinct from customs duties, which are levied on goods imported. Excise duties were first introduced during the Civil War. The tax on services in the form of an entertainment tax came into being during the First Great War. Purchase tax, a form of excise duty, introduced during the Second Great War, subjected a large range of commodities to

a tax at the time of purchase as distinct from the time of manufacture. The purpose of this tax was twofold. It augmented the revenue, and it also discouraged the demand for goods of all kinds and thus freed labour for more urgent war purposes and restricted private spending.

Included in excise duties are those taxes collected by means of licences, such as the licence required to retail tobacco, wines, spirits, and beer, to practise as an auctioneer, employ male servants, own dogs, etc. The principal sources of excise duty have been spirits, beer, matches, mechanical lighters, licences, British wines, table waters, patent medicines, playing cards, entertainments, and commodities subject to purchase tax. The growth of revenue from excise duties is shown as follows: 1913-14, £39½ millions; 1948-49, £733½ millions.

**Excise Bill.** Measure introduced by Sir Robert Walpole in 1733 for the substitution of an excise instead of a customs duty on wine and tobacco. His object was to lessen smuggling and, by making the ports free, to stimulate a re-export trade. The bill aroused much opposition and was withdrawn.

**Exciter.** Electric generator or dynamo used for supplying current to excite the field magnets of a larger machine. It is used with certain types of direct current machines where it is not practicable to make them self-exciting; also for all alternators. It may be separately driven, but is usually belted or direct-coupled to its main machine; it may reach sizes of 150-200 kilowatts.

An advantage of providing each machine with its own exciter instead of running a group of machines from one house exciter is that control of the main excitation may be carried out by varying the exciter voltage by a resistance in its field circuit, which will have to deal with a very small amount of power. With a common exciter, the control resistance will have to deal with the main machine field current, and large amounts of heat will be generated and have to be dissipated.

Large alternators are frequently fitted with stabilised exciters, the main exciter having its own field supplied by a smaller one. This arrangement prevents surges of current in the main alternator being reflected in the field system and demagnetising or reversing the exciter.

In cinematography an exciter is a small low voltage electric lamp in the sound head of a cine-projector. The light from the lamp passes through the sound track on the film, the varying light falling upon a light-sensitive cell. The varying current produced by the latter, after amplification, is converted into sound by loud speakers.

**Exclusion Bill.** Measure introduced into the English parliament in 1679 for the purpose of excluding James, duke of York, from the throne. The country was greatly excited by Titus Oates's story of a Roman Catholic plot, and the bill was introduced. Mary and William of Orange being named to succeed Charles II. To save his brother, Charles dissolved parliament, but the bill was again brought forward in 1680 and passed by a large majority in the house of commons. The lords rejected it; and a proposal to substitute the duke of Monmouth for James led to its abandonment in 1681.

**Excommunication** (Lat. *ex*, out of; *communis*, common). Term used specifically for the temporary or permanent exclusion of an offending member from the fellowship of the Christian Church. Generally it means exclusion from any organized community. Examples are to be found in the history of the Jews (Lev. 13; Num. 9 and 12; Ezra 10). It existed among Greeks, Romans, and Druids, and has affinity in the tabu of the Polynesian islanders.

The Christian Church claims Scriptural authority for excommunication (Matt. 16 and 18; John 12 and 16; 1 Cor. 5). Imposed first by the community and then by the bishops as a penalty for heresy immorality, or disobedience its primary objects were the bringing of the offender to repentance, and the protection of the Church from corrupting influences. In pagan and Christian usage it has been imposed in degrees of varying severity, ranging from admonition to temporary and partial suspension, and, finally, anathema (*q.v.*).

Gregory VII first claimed the right to depose kings by excommunication, and an ecclesiastical authority could place a whole country under an interdict. Papal claims of this nature led to much trouble in Elizabethan England.

In the Roman Catholic Church excommunication is now governed by the code of canon law, 1918. The Anglican view is represented in Hooker's Ecclesiastical Polity and Canons 65 and 68. At one time in England, after a person

had been under excommunication for 40 days he might, on the issue of a certificate of the diocesan authority to the court of chancery, be imprisoned on a writ of *excommunicato capiendo* until he submitted and was absolved, and the sentence carried with it a number of civil disabilities. By an act of George III, 53, c. 127, it was provided that no person excommunicated could be imprisoned for more than six months and that no civil incapacity should be imposed.

By 54 George III, c. 68, a similar law was enacted for Ireland. Civil penalties were abolished in Scotland in 1690. In Great Britain, though disciplinary jurisdiction of the eccles. courts over the laity exists still, it is subject to statute and common law, and excommunication in the old sense is virtually obsolete. In recent times imprisonment has been imposed only in cases of ritualistic disobedience. In the Scottish Presbyterian churches, lesser excommunication is an affair of the kirk session; the greater excommunication is a prerogative of the presbytery.

Modern cases of excommunication were those of Bishop Colenso (*q.v.*), 1863, whose deposition was negated as invalid by the judicial committee of the privy council in 1865, and of Father George Tyrrell for his criticism of Pius X's encyclical against modernism (*q.v.*) in 1907. Notable excommunications in earlier times were those pronounced by Gregory VII against the emperor Henry IV, 1077; Innocent III against King John of England, 1208-14; Gregory IX against the emperor Frederick II, 1228-45; Julius II against Louis XII of France, 1510; Leo X against Luther, 1521; Paul III against Henry VIII, 1535; and Pius V against Elizabeth, 1570.

**Excursion, THE.** Blank verse poem by William Wordsworth. Published in 1814, it forms the second part of a projected work in three parts entitled *The Recluse*, conceived as a philosophical poem on Man, Nature, and Society. Wordsworth never wrote the third part, but *The Prelude*, an introduction, and the first book of the first part of *The Recluse* were published posthumously in 1850 and 1888 respectively.

**Exe.** River of Devon, England. It rises in Somerset on Exmoor and flows right across Devon, mainly S., to the English Channel, which it enters by a navigable estuary 6 m. long. Exeter stands on it, as does Tiverton, while Exmouth is at the mouth of the estuary. Its

length is 55 m. Its chief tributaries are the Barle and other streams that rise on Exmoor. A ship canal, 5 m. long, connects Exeter with Topsham, from which point the river is navigable. There is some trout fishing in the Exe, which flows mainly through wild and beautiful scenery.

**Execution** (Lat. *exsequi*, to follow out, carry out). Act of performing anything. It is used in law (*v.i.*), and also in other senses, as in executing a commission, or the execution of a piece of music. In a special sense the word has come to mean the carrying out of a death sentence. In England the death penalty was carried out mainly in two ways, by hanging or by beheading. The former was the fate of the ordinary offender. Beheading was reserved for political offenders and persons of rank.

In England the death penalty was in course of time confined to serious crime, and hanging became the only form. Until 1866 executions were carried out in public. In France persons sentenced to death are publicly executed by the guillotine, and in Spain by garroting. Under the Nazi regime, Germany revived execution by beheading with an axe, and this form of capital punishment is carried out in China with the sword. In the majority of states in the U.S.A. execution is by the electric chair, but in some states murderers are asphyxiated in a gas chamber. *See* Capital Punishment; Electrocution; Guillotine.

**Execution.** In English law, term generally used to mean the carrying into effect of the judgment of a competent court. In civil cases this is done by the successful litigant applying to the court for a writ of execution, which as a rule can be had for the asking at an office attached to the court. Some kinds of execution, however, require an order from a judge or judicial officer. Execution is also used for perfecting a legal document by signing, sealing, or delivering it with all proper formalities.

**Executive.** Name given to a body of men who carry out the orders of others. In most modern states there is a distinction between the executive and the legislature; the latter making the laws which the former carry out. Of recent years in England there has been a tendency for the executive to intrude in the field of the legislature. (*See* Cabinet; England: Constitution.)

In the U.S.A. the term executive may refer to a director or leading

official of a business organization; it may also (sometimes with the prefix chief) refer to the president or the governor of one of the 48 states or the mayor of a city. Executive Mansion is the old name for what is now the White House, Washington.

**Executor.** In English law, the person or persons appointed by a will to carry into execution a will as the "legal personal representative" of the deceased. An executor becomes the legal owner of all the deceased's property. His first duty is to arrange for the funeral of the deceased. Then he proves the will, and gets in debts owing to and other property of the deceased. To safeguard himself he should publish advertisements in the London Gazette and in a local newspaper calling for all persons having claims against the deceased to notify them to him. At the end of two months from the advertisement he may distribute the estate, having regard only to the claims notified to him, and will not be personally liable in respect of other claims. In paying the debts he must, if the estate be insolvent, proceed in the order required by the laws of bankruptcy. An executor is entitled to prefer one creditor to another of the same degree, i.e. he may pay one creditor in full even though there are not sufficient assets to pay the other. The executor has also a right to retain out of the estate sufficient to pay any debts which he is owed by it. After payment of debts the executor distributes the estate in accordance with the will of the deceased, but he cannot be compelled to pay any legacies earlier than a year after the death. *See* Will.

**Executory.** Term used in English law in two senses. An executory contract is one which consists of a promise on both sides, e.g. I will make you a chair if you will pay me £10 for it. An executory devise is a gift of land by will, where the estate of the devisee is to arise upon a contingency. Since 1925 executory devises and other executory interests can take effect only as equitable interests.

**Exegesis** (Gr., explanation). Branch of study concerned with the interpretation of Holy Scripture. Properly including all that is connected with the full exposition and understanding of the Bible, it is more commonly restricted to literary interpretation, which determines the sense of the sacred text upon the same principles that would be applied to any other literary work. It differs from Biblical

criticism in taking the text as it stands, and examining its meaning rather than its origin and authenticity. Being concerned not merely with the precise meaning of the text, but with the doctrines and practical inferences to be drawn from it, the study of exegesis is an extensive one.

Exegetes have from early days been divided into two classes: the Literalists took the statements of Holy Scripture in their literal and grammatical meaning; the Allegorists found an inner and spiritual significance underlying the obvious meaning of the text. The N.T. writers afford many examples of the influence of this school. For example, many O.T. passages are applied to Christ which obviously referred originally to contemporaries of the writers. The two schools were long in antagonism, believers in verbal inspiration naturally demanding a literal interpretation of the text of Scripture; while the medieval tendency to read sacramental doctrine into every text of Scripture led to the most far-fetched allegorisation.

The history of exegesis shows a great activity of commentators among both Jews and Christians in the days of the Early Church; but little work was done during the Middle Ages. The allegorical interpretation of a few favourite texts was the subject of most of the books and sermons that could be called exegetical; and collections of patristic comments replaced critical investigation. The Reformation saw a great revival of Bible study, and most of the commentators of this period belonged to the literal school. This may be largely attributed to the need for proving from Scripture the doctrines that were now emphasised, as opposed to accretions to primitive doctrine which owed their existence mainly to allegorical exegesis. See Bible.

**Exelmans**, RÉMY JOSEPH ISIDORE, COUNT D' (1775-1852). A French soldier. Born at Bar-le-Duc, Nov. 13, 1775, he joined the Revolutionary armies in 1791, becoming a captain of cavalry in 1799, after his courageous behaviour during the Italian campaigns. On Murat's staff from 1801, he was promoted general after Eylau, 1807, the climax of his active service during the campaigns in Prussia and Poland. Captured in Spain, he was held a prisoner in England 1808-11. He took part in the Russian expedition, 1812, and at Waterloo commanded a cavalry corps. After

the Bourbon restoration he lived in exile until 1823. His high reputation, however, led to his restoration as a peer of France, 1831, and to his elevation to the rank of marshal. He died Nov. 11, 1852.

**Exercise** (Lat. *exercitium*). Movements of the muscles, either voluntary or passive. Voluntary exercise means deliberate movement; passive exercises are movements effected by the manipulation of another person or by a machine. Muscular contraction, such as occurs during steady walking, stimulates the circulation of the blood through the muscles. This, in turn, acts on the heart and respiratory system, causing both to act more vigorously. The formation of more waste products in the tissues makes increased demands upon the excretory system.

Severe exercise is beneficial to the young and healthy, but should not be undertaken by persons beyond middle life or those suffering from cardiac or other serious affections. Heavy muscular effort, long continued, such as that of a blacksmith, tends to produce a thickening of the walls of the arteries, which may eventually lead to heart disease, apoplexy, and other diseases, especially if associated with alcoholism or syphilis. Regular daily exercise is an important part of medical treatment in many conditions, for it is the great sedative of the nervous system. Suitable exercises are of value to strengthen the muscles and correct wrong methods of carrying the body, which may have resulted from weakness or curvature of the spine, and other affections which may follow rickets or malnutrition. Graduated exercises are given in treating pulmonary tuberculosis. In paralysis, specific exercises may educate other nerve tracts to take over the duties of the sick cells.

Passive exercises are mainly employed to prevent wasting of the muscles and stiffening of the joints following sprains or fractures, and to increase the mobility of joints in those suffering from rheumatism or similar conditions. See Physical Training.

**Exeter**. British cruiser of the County class, sunk by the Japanese on March 1, 1942. Completed in 1931 at a cost of £2,000,000, the Exeter displaced 8,370 tons on a length of 575 ft. and a beam of 58 ft. Geared turbines developed 80,000 h.p. to give a speed of 32.5 knots. She mounted six 8-in. guns in twin turrets, four

4-in. A.A. guns, four 3-pounders, multiple machine-guns, and six torpedo-tubes. She was one of three cruisers which, on Dec. 13, 1939, engaged and chased into Montevideo harbour the German battleship Graf Spee. The Exeter received 40 hits in the action and suffered 100 casualties, but one of her shells destroyed the enemy vessel's fire-control system. (See Plate, Battle of the.)

In 1942 H.M.S. Exeter was with Admiral Doorman's cruiser squadron operating off Java, and in the battle of the Java Sea (*q.v.*) on Feb. 26 was so severely damaged that she had to withdraw for repairs. There was no time to dock her properly, and she sailed with six of her eight boilers out of action. Early in the morning of March 1 two Japanese cruisers were sighted, and a little later two more cruisers and three destroyers came into view. Allied destroyers in escort, H.M.S. Encounter and U.S.S. Pope, attempted to ward off the enemy by launching a torpedo attack, and one Japanese cruiser was hit, but the Exeter received a direct hit in "A" boiler room, which stopped the engines and cut off power throughout the ship. As she lay helpless she was repeatedly hit by Japanese gunfire, until at 11.50 a.m. her commander gave orders to sink and abandon ship. The surviving members of the crew were made prisoners-of-war.

**Exeter**. City, county, parl. and mun. bor., county in itself since 1537, river port, and county town of Devon, England. It stands on the Exe, 17½ m. W.S.W. of London, and has two railway stations. Still partly surrounded by its old walls,

it occupies an elevated position on a ridge of land overlooking the Exe.

The chief attraction of the city is its comparatively small but magnificent cathedral, with massive Norman transeptal towers (a unique feature except for a copy in the collegiate church at Ottery S. Mary), dating from the 12th century; the remainder of the edifice was transformed between 1280 and 1370 from the Norman to the Decorated style, and a complete restoration was undertaken by Sir G. G. Scott towards the end of the 19th century. Among other interesting buildings are the guildhall, rebuilt in 1330, the episcopal palace, the College of Priest Vicars,

Exeter arms

S. Nicholas Priory, the remains of Rougemont Castle, and Royal Albert memorial museum and art gallery. The city is the seat of a bishop.

The chief educational establishments are the Royal Albert memorial college and Exeter School. The former, which is affiliated to the universities of Oxford and Cambridge, was founded in 1865 as a technical college, and was given the rank of a university college in 1901. The latter, one of the most important public schools in the west of England, was founded in 1629. In 1876 it was reorganized and new buildings were erected: a chapel, gymnasium, laboratory, swimming baths, etc. The old buildings in

Exeter. University College, part of the Albert Memorial

*Damnoniorum*, and the Anglo-Saxon *Exancestre*, Exeter, as the principal fortified town of the W., was frequently besieged by the Danes and other invaders. It capitulated on terms to the Conqueror in 1068, was surrendered in 1136, successfully withstood attacks in 1467, 1497, and 1549. It surrendered to the royalists in 1643, but the parliamentarians were readmitted three years later. In April, 1942, it was subjected to German "Baedeker" air raids, the cathedral and High Street being damaged, and the main building of the city hospital, the library, and several churches destroyed. Post-war excavation of the bombed area brought to view remains of two Roman houses. Exeter is the Chatteris of Thackeray's *Pendennis*, and *Roxonbury* in the Hardy novels. Its motto is *Semper Fidelis*.

**Exeter, MARQUESS AND DUKE OF.** English titles borne by several distinguished families. The first duke was John Holand, a half-brother of Richard II and a descendant of Edward I. The son of

Thomas Holand, earl of Kent, and Joan, afterwards the wife of the Black Prince, he was made a duke in 1397. He had already married a daughter of John of Gaunt, and had been made earl of Huntingdon. One of Richard's chief assistants, he was condemned and executed in Jan., 1400, for conspiring against Henry IV, his titles and estates being forfeited. After Thomas Beaufort, earl of Dorset, had been duke of Exeter from 1416 to 1426, the title returned to the Holands; in 1443 John Holand, a son of the executed John, was made duke of Exeter. His son, Henry, lost his title during the Wars of the Roses.

The title of marquess of Exeter began with the Courtenays. In 1525 it was given to Henry Courtenay, earl of Devon. He was executed in Dec., 1538, his heirs being deprived of his titles. In 1605 Thomas Cecil, Lord Burghley, a son of the great Lord Burghley, was made earl of Exeter. His descendants continued to hold the title, and in 1801 Henry, the 10th earl, was made a marquess. In 1898 William Thomas Brownlow Cecil (b. 1876) became the 5th marquess. The seat is Burghley House and the eldest son is known as Lord Burghley.

**Exeter Book, THE.** MS. collection of Anglo-Saxon poems in the library of Exeter cathedral, to which it was presented in the 11th century by Bishop Leofric. It is clearly written on vellum by one scribe, and forms the most important body of Anglo-Saxon literature that has come down to us. It includes Cynewulf's *Christ*, *The Legend of S. Juliana*, a metrical life of Guthlac, *Widsith*, and *The Wonders of Creation*. It was first printed as *Codex Exoniensis* in 1842, with translations by Benjamin Thorpe.

#### Exeter College.

A college of the university of Oxford. Founded in 1314 by Walter de Stapeldon, bishop of Exeter, it was

the High Street were then abandoned, and the school is now outside the city.

As an important rly. centre, Exeter has a floating basin and is connected with the sea by a ship canal (begun in 1564), which extends 5 m. and opens into the estuary near Topsham. Formerly the seat of an active woollen industry, Exeter is an agricultural centre, while brewing, iron-founding, and Honiton lace and paper manufactures are carried on. Market day, Fri. One M.P. is elected. Pop. est. 68,700.

The British *Cæsar*, the Roman *Isc*

Exeter, Devon. West front of the cathedral and the 14th-15th century screen ornamented with sculptured figures of Biblical characters. Top, left, pillared façade of the Guildhall, added to the original building in 1598

first called Stapeldon Hall, afterwards Exeter Hall, and then Exeter College, being enlarged by Sir William Petre in 1565. It has always had a special connexion with Devon and Cornwall, and certain scholarships are confined to candidates educated or born in the West country.

Famous men educated here were the first earl of Shaftesbury, R. D. Blackmore, and F. D. Maurice. The buildings face on Turl Street and Broad Street, and their chief feature is the 19th cent. chapel, with decorations by Burne-Jones and William Morris, both members of the college. The hall is notable and there is a small but beautiful garden. The head is called the rector.

**Exeter Hall.** Former public building in London, on the site now occupied by the Strand Palace Hotel. Built in 1831 on land belonging at one time to the marquess of Exeter, it was first the headquarters of the Sacred Harmonic Society, where most of the great singers of the time, including Jenny Lind, appeared. It later became known as the place where the annual meetings of many religious bodies were held. In 1880 it was acquired by the Y.M.C.A., which occupied it until 1907. The hall held 5,000 people.

**Exfoliation.** A form of rock weathering in which the outer surfaces of the rock spall off in flakes or skins, so producing a rounded dome-like shape in boulders or outcrops. It may be the result of alternate heating and cooling of the rock surface by day and night, but experiments do not support this theory. Alternatively, it may be caused by the expansion of rock-forming minerals as they begin to decompose because of chemical combination with percolating rain-water.

**Exhaust** (Lat. *ex*, from, out; *haurire*, to draw). The stream of burnt gases ejected from an engine; or the exhaust piping itself. In the internal combustion engine the waste gases after combustion are expelled through the exhaust valve and the exhaust port into the exhaust pipe at the exhaust stroke of the piston.

**Exhibit.** In law, an article or document shown to a witness or a person making an affidavit and identified by him as being an article or document referred to in

his evidence or affidavit. The exhibit is then usually numbered; if an exhibit to an affidavit it is marked by the commissioner for oaths before whom the affidavit is sworn. The commissioner's fee is 1s. 4d. for marking each exhibit.

**Exhibition** (Lat. *ex*, out; *habere*, to have). Term used for a display or show of any kind. Thus there are exhibitions of pictures and other works of art, e.g. the summer exhibition of the Royal Academy at Burlington House, London. In a special sense the

Exeter College, Oxford. The front quadrangle, showing the fine Gothic chapel  
*Hills & Saunders*

word is used for displays of manufactured goods, and national and international exhibitions of this kind were organized on an enormous scale during the 19th and 20th centuries. These are known to the French as *expositions*. In a sense they are the modern equivalent of the great medieval fairs, although the idea is not so much to sell goods directly as to make them known.

Several exhibitions were held in Paris in the time of Napoleon; the practice of awarding medals was then introduced. Others followed—Great Britain, Germany, and other European countries, the British Empire and the U.S.A. borrowing the idea from France. Some of them were confined to a single industry, and to the products of the home country, but others were wider in their scope. Paris remained the centre of this form of activity, but exhibitions were held in London (1828), Manchester (1837), Leeds (1839), and Birmingham (1849).

The modern international exhibition is regarded as dating from the great exhibition of 1851, in Hyde Park, London. The Crystal Palace was built to accommodate the exhibits, and it was a great success. It was visited by over 6,000,000 people, and from the fund money was set aside for

scholarships—1851 exhibitions they are called—and for other purposes. Other international exhibitions followed: New York (1853); Paris (1855); London (1862); Dublin (1865); Paris (1867); Vienna (1873); Philadelphia (1876); Paris (1878); The Hague (1888); Glasgow (1888). In 1889 a great exhibition was held in Paris, the Eiffel Tower being erected for it. In 1893 there was one at Chicago. Glasgow had another in 1901. The Paris exhibition of 1900 was the largest till then held in Europe, and in 1904 that at St. Louis again created a record for size. In 1901 a Pan-American exhibition was held at Buffalo, and others were held at Liège (1905), Brussels (1910), Turin (1911), and Ghent (1913). Before the First Great War, beginning with the Franco-British

exhibition of 1908, London staged a series of exhibitions at Shepherd's Bush and Earl's Court.

The British Empire exhibition (*g.v.*) at Wembley, 1924 and 1925, was the biggest post-war display, and there was an exhibition in Bellahouston Park, Glasgow, in 1938. Paris was the scene in 1937 of an international exhibition of arts and crafts, Chicago in 1933, and New York in 1939 of a World's Fair. In Great Britain the practice has grown up of holding annual exhibitions devoted to individual trades or purposes; e.g. the British Industries Fair, Motor Show, Ideal Homes, Radiolympia, Book Fair. See Festival of Britain, in N.V.

**Exhibitionism.** A term used by psychologists for behaviour designed to attract attention. It includes the wearing of bizarre clothes and loud and continuous talking; appears in the "naughtiness" of neglected children; and is occasionally seen in actors, writers, and politicians. In Freudian psychology it is particularly applied to the male perversion which consists in taking sexual pleasure in being looked at. This is an inversion of voyeurism, i.e. the desire to look at the object of sexual pleasure.

**Exhumation** (Lat. *ex*, out of; *humus*, ground). Act of digging up and removing any object from the

ground, but generally applied to the removal of a dead body from its burial place. It is a misdemeanour to do this for any purpose without legal authority. In England such authority may be the Home secretary or coroner where foul play may reasonably be suspected, and the ordinary (*q.v.*) of the diocese when reinterment is the reason. See Autopsy; Burial Acts.

**Exile** (Lat. *exsilium*). Removal from one's native land, either voluntarily or under compulsion. The word probably means "leaping forth," from the root *sal-*, which occurs in *con-sul* and *Sali*, the leaping priests of Mars.

In Greece, exile was chiefly a punishment in cases of homicide, but was also enforced for certain crimes and offences against the state and society. Homicides could anticipate their sentence by voluntary withdrawal, but were liable to be put to death if they returned. Exile was also a political measure employed in troublous times. It carried with it disfranchisement and confiscation of property. A peculiar method of banishment was ostracism (*q.v.*).

At Rome, exile did not become a recognized form of punishment until about the time of the Gracchi. Theoretically, a citizen's life and liberty were inviolable, so the fiction of *aquae et ignis interdictio*, exclusion from the use of fire and water, was invented, since anyone deprived of these necessities in Rome would perforce have to seek a home elsewhere, it being an offence for anyone to supply them to a person under the ban. It is uncertain whether *interdictio* involved loss of civil rights and confiscation. The sentence was at first pronounced by the *comitia centuriata*, and later by the *quaestiones perpetuae*, the standing courts which dealt with serious offences, such as high treason, poisoning, and arson. Anyone could voluntarily leave the city, but was forbidden to return under pain of death.

In early imperial times, *deportatio* took the place of *interdictio*. The condemned person was compelled to take up his abode for life in some place out of Italy, or on some island. He was sometimes allowed to choose the place of exile himself, but generally it was assigned to him. Deportation entailed loss of civil rights and confiscation.

A milder form of banishment was *relegatio*, temporary or for life, pronounced by a higher magistrate or the emperor against any person whose presence in the city was considered undesirable. It entailed

neither loss of civil rights nor confiscation, as is expressly stated by the poet Ovid, who was exiled by Augustus to Tomi on the Black Sea for some unknown offence. See Displaced Person; Outlawry; Refugee; Transportation.

**Existentialism.** Philosophy of existence, primarily concerned with the nature and experience of the individual. Preoccupied with the nature of being or essence, with individual human consciousness coming into a world of existences, and, above all, with action, it derived in part from Kirkegaard. This philosopher, an opponent of Hegel, declared that "every man is primitively planned to be a self . . . Truth is subjective" (by which is implied that thinking is not handling propositions but living, that thought is not a proposition, but a man thinking). His dictum "choose, leap, and be free," was interpreted by the existentialist philosophers, Heidegger and Jaspers, in the light of an nihilistic doctrine.

Shortly before and during the Second Great War, existentialism gave rise to a French school of philosophers, dramatists, and novelists, of whom the more sensational were Jean Paul Sartre (*q.v.*) and Albert Camus. The atheistic philosophy exemplified in Sartre's *Huis Clos*, or Camus's *L'Étranger*, aroused considerable controversy, not only in France, but in Scandinavia, Great Britain, and the U.S.A. Such works were directly concerned with the problem of man's relations with himself and with others, and received a special hearing at a time when many human beings, often in complete isolation, had to make momentous decisions. Consult Existentialism, G. de Ruggiero, 1947.

**Ex Libris** (Lat., from books). Label of ownership usually called in England a bookplate (*q.v.*). Pasted inside the front cover of a book, it bears the name and device of the owner, preceded by the words *Ex Libris*. This Latin appellation is incorporated in the titles of societies devoted to the study of book plates.

**Exmoor.** Picturesque and elevated moorland expanse in Somerset and Devon, England. Formerly a forest with an area of about 20,000 acres, its trees have largely disappeared, and three-fourths of it are now covered with heather

and a coarse grass, on which are pastured ponies, sheep, and red deer, the last preserved for stag-hunting. In 1917 Sir Thomas Acland granted a lease of lands covering between 7,000 and 8,000 acres to the National Trust for 500 years, and in 1943 Sir Richard Acland made over the land outright; this area includes some of the finest hill, valley, and woodland scenery of Exmoor. Lorna Doone, Blackmore's romance, has made Exmoor familiar. The river Exe takes its rise here. Other streams are the Barle and the Lyn, and all are fished for trout. The highest point is Dunkery Beacon, 1,707 ft., in the centre. To the S.W. is Span Head, 1,618 ft. Consult Wild Exmoor Through the Year, E. W. Hendy, 1946.

Exmouth. M.M. Training ship for boys for R.N. and In 1948 it was renamed Worcester

**Exmouth.** Former name of a training ship for boys for the Royal Navy and merchant navy, built in 1876, and moored off Grays, Essex. In 1941 she was taken over by the Royal Navy and moved to Scapa Flow as an accommodation vessel; the training school was transferred to Bray Court, near Maidenhead. In 1946 the Exmouth was refitted as a training ship, and in 1948 renamed Worcester (*q.v.*) to take the place of the ship of that name belonging to the Incorporated Thames Nautical Training College.

**Exmouth.** Urban district and watering place of S. Devon, England. It is on the left bank of the Exe, at its mouth in the English Channel, 10½ m. by Southern rly. S.S.E. of Exeter. The first seaside resort to be developed in the county and still among the most popular, Exmouth is largely resorted to by sufferers from lung complaints. In history it is first mentioned c. 1000 as being in possession of the Danes. Once a flourishing seaport, it contributed ten ships for the attack on Calais in 1347. In the Civil War it sustained a long siege on behalf of Charles I. Besides fishing, brick

Exmouth, Devon. View from the east looking along the promenade and sands towards the mouth of the Exe and the hills beyond it

making is an industry, and all sports associated with a seaside holiday are catered for. Pop. est. 18,000.

**Exmouth**, EDWARD PELLEW, 1ST VISCOUNT (1757-1833). British sailor. He was born at Dover, April

19, 1757, and entered the navy at 13. In 1776 by his gallantry at Lake Champlain (*q.v.*) he secured his promotion to lieutenant. In 1793 he was appointed to the frigate *Nymphé*. For his capture of the *Cléopâtre* he was knighted in 1793, and in 1804 he was promoted rear-admiral and commander-in-chief in India. Returning to England in 1809, he became commander-in-chief of the North Sea, 1810, and of the Mediterranean station, 1811. In 1814 he was raised to the peerage. In 1816, on the refusal of the dey of Algiers to cease his piracies, Exmouth was sent to bombard that city, with the result that over 2,000 slaves were liberated. Made viscount in that year, he died Jan. 23, 1833. The title is still held by his descendants, Edward (b. 1868) becoming 8th viscount on succeeding a cousin in 1945. A Life of the 1st viscount by C. N. Parkinson appeared in 1934.

**Exmouth Gulf**. Inlet of the W. coast of Australia. It penetrates inland about 65 m., and at its entrance is 30 m. across. It is sheltered from the Indian Ocean by a peninsula 80 m. in length, which terminates in the North West Cape.

**Exodus**. The second book of the Pentateuch, or rather Hexateuch. The title, taken from the Septuagint (Ex. 19), means the "Going-forth." The Hebrew title

is "Names" or "And these are the Names." The book falls into two main divisions: (a) history of Israel in Egypt, chaps. 1-18; (b) account of Moses' administration at Sinai, whither he had led the children of Israel, chaps. 19-40. The former section incorporates a much earlier composition, the Song of the Red Sea (chap. 15). The latter includes one of the three chief Hebrew codes of law (beginning chap. 20, v. 22), described as the Book of the Covenant. Chap. 20 contains the ten commandments. See Hexateuch.

**Exogamy** (Gr. *exō*, outside; *gamos*, marriage). Primitive institution binding a man to marry outside his own social group. Its primal impulse was probably economic rather than eugenic. In those societies wherein the family is overshadowed by the kinship group, the exogamous clan is often associated with a totem, a mystical token of kinship. Highly developed among the Australian aborigines, it is usual among the N. Mongols, and widespread with the American Indians. Arising from it are such marriage customs as marriage by capture. A special form called hypergamy existed in some Hindu castes; it required a woman to marry into a caste higher than her own. See Marriage; Society.

**Exophagy** (Gr. *exō*, outside; *phagein*, to eat). The practice among some cannibal peoples of seeking their human food outside their own kin, totem, or tribe. The contrary usage is endophagy. The words are loosely employed by different writers; endocannibalism and exocannibalism might usefully be reserved for the man-eating of totemic tribes, exophagy for extra-tribal cannibalism (*q.v.*).

**Exophthalmic Goitre**, OR GRAVE'S OR BASEDOW'S DISEASE. Condition due to excessive or disordered secretion of the thyroid gland, the important ductless

gland situated in front of the lower part of the neck. Strong emotion such as fright, worry, or grief may be an antecedent factor, and the lighting up of a septic focus seems in some cases to be a trigger cause, though the essential underlying cause is still unknown. The disease is much more common in women than in men because strain is thrown on the thyroid in menstruation and in pregnancy, and its incidence rises with civilization. A palpitation of the heart and throbbing of the large blood vessels in the neck with a pulse rate of 100-200 beats per minute; exophthalmos, or protrusion of the eyeballs; fine tremor of the muscles of the lower and upper limbs; these are the classical signs of the disease. Emotional change and disbalance are distressing features.

Treatment consists in rest, freedom from worry, and the giving of iodine, but the essential cure is surgical removal of a large part of the gland, enough being left to carry on its normal function.

**Exophthalmos**. (Gr. *ex*, out; *ophthalmos*, eye). Condition of prominence of the eyeballs, or of apparent prominence of them caused by retraction of the eyelids. It is associated with exophthalmic goitre, hyperthyroidism, and other less common physical conditions. Exophthalmos, once established, tends to persist.

**Exorcism** (Gr. *ex*, out; *horkizein*, to adjure). The expulsion of malign spirits by ritual means. Belief in demon possession and demon obsession is revealed in early Sumerian inscriptions. The Semitic Babylonians regarded most mental and bodily ailments as due to intrusive demons, whose expulsion was sought by the incantation of charms containing a divine name, fortified by material aids. Exorcism passed into the Greco-Roman world, was rife in W. Asia in N.T. times, was taken over by early Christianity, and survives here and there in ecclesiastical ritual. Baptismal exorcism is retained by the Roman and Old Lutheran communions.

In primitive culture disease is commonly attributed to evil magic wrought by one person upon another. The intrusive evils, whether human hosts or non-human demons, may haunt persons or places. Preventive exorcism is one chief purpose of the amulet. Expulsion may be attempted by sympathetic magic, such as the Babylonian wasting of a wax effigy of the sorcerer, or the

Dakota shooting of a bark effigy of the demon.

Ills may be driven out by drums, as in Patagonia, or other musical means, as in the story of David and Saul; they may be transferred to scape-animals, such as fowls, as in W. Africa; to goats, as in Arabia; or to swine (Matt. 8). They may be enclosed in a receptacle left by the roadside, or thrown into the stream, as in Uganda; conjured into a proa, driven out to sea, as in the Malay archipelago; or attached to a rag or wisp of hair suspended from a tree. An appeal or command addressed to the demon may be fortified by a promised sacrifice or a vow. *See Demonology*; consult also *The Golden Bough*, J. G. Frazer, new ed. 1922.

**Exoskeleton.** Zoological term for the hard structures produced by modification of some or all parts of the integuments of animals. It acts as a support or a protection or both for the softer organs within, and to it muscles may be attached. Examples are among the Arthropoda, e.g. crabs, lobsters, spiders, and insects. Less obvious examples are the scales of reptiles and fishes, the feathers of birds, and the fur of mammals.

**Expansion** (Lat. *ex*, from, out; *pandere*, to spread). Increase in the dimensions of a body. It may result from a change of temperature or state. The recognized coefficients of thermal expansion are (a) linear, defined as change in length per unit length per degree rise in temperature; (b) areal or superficial, defined as the change in area per unit area per degree rise in temperature; and (c) volume or cubical, defined as the change in volume per unit volume per degree rise in temperature. The linear and areal coefficients are applicable only to solids and for an isotropic material are approximately one-third and one-half respectively of the volume coefficient. In some substances, e.g. crystals, the value of the linear coefficient will differ in different directions. The magnitude of expansion for a solid is quite small; an iron bar one metre in length will expand by approximately one millimetre when heated from 0° C. to 100° C. Typical values of linear thermal expansion coefficients (per degree C.) are as follows:—

Platinum ..	0.0000089
Copper ..	0.0000168
Zinc ..	0.0000292
Glass ..	0.0000083
Quartz (crystal)	
axis ..	0.0000075
⊥ axis ..	0.0000137

The fact that platinum and certain kinds of glass have almost identical coefficients allows the making of airtight seals of platinum wire in glass. "Invar," a patent nickel-steel with an expansion coefficient of the order of 0.000001, is used in clock pendulums.

Liquids and gases have to be contained in vessels which also expand, and so what is directly observed when fluids are heated is the apparent expansion. The apparent does not differ appreciably from the true expansion in gases, whose expansion (cubical) coefficient is much larger than that of solids. The mean coefficient of volume expansion of mercury between 0° C. and 100° C. is 0.000182. Water decreases in volume between 0° C. and 4° C., when its density is a maximum; thereafter it expands until it changes state at boiling point.

Another physical condition to modify the size of a body is the application of a magnetic field. With nickel a marked decrease in length is shown, and the phenomenon, known as magnetostriction, is applied to the construction of mechanical oscillators.

**Expansion of the Universe.** The extragalactic nebulae are found to be receding from the sun at speeds which increase proportionally to their distances. The universe thus seems to be expanding at a rate which doubles all distances in about 1,300 million years. This fact suggests that the universe may once have been confined to a relatively small volume of space, the separate galaxies moving at different speeds which have in the course of time carried the fastest-moving ones farthest away. The equations of the general theory of relativity have various possible solutions, some of which correspond to an expansion of space itself which may be the cause of the observed recession of the nebulae.

**Ex parte** (Lat., from one side). Expression used in English law to signify something done or said by one person not in the presence of his opponent. Thus an *ex parte* application is one made in the absence of the other side. An *ex parte* statement is one made when no one present can contradict it.

**Expectant.** Term used in English law. An expectant estate is one that comes into possession and enjoyment when some date arrives or event happens. Reversions and remainders are the only expectant estates known to common law; but when wills of land were allowed the law permitted executory interests.

An expectant heir is one who is bound to come into property on the death of another.

**Expectation of Life.** Term used by actuaries and others engaged in life insurance business for the number of years a person may be expected to live. By careful calculations tables have been worked out which are used when annuities are bought and sold. The expectation differs for males and females, and for different ages, but a roughly accurate method is to value the expectation of life at two thirds of the difference between the present age and 80. Thus a man of 41 may count upon living to 67, this being 26 more years, two-thirds of 39, which is the difference between 41 and 80. Some writers have objected to the term, and equation of life has been suggested as a substitute. *See Annuity*; *Death Rate*; *Insurance*.

**Expectorant** (Lat. *ex*, out; stem, *pector*-, breast). Drug which assists the expulsion of mucus from the lungs and air passages. Such drugs include ammonium carbonate, senega, squills, ipecacuanha, benzoin, and balsam of tolu.

**Expeditionary Force.** Military formation sent overseas from its home bases for operations in foreign territory. After the British army was reorganized in 1900, an expeditionary force of regular troops was trained and held in readiness for immediate service abroad. The force consisted of six divisions of infantry, one division of cavalry, and ancillary troops, totalling some 140,000 men. This was the British Expeditionary Force (*q.v.*) that landed in France in Aug.-Sept., 1914. Throughout the First Great War, the term was applied to any important military force sent out to a separate theatre of war under an independent commander. Thus the Mediterranean Expeditionary Force fought in Gallipoli, Salonica, and Egypt, the Italy Expeditionary Force was sent to the assistance of Italy, and the Archangel Expeditionary Force assisted the White Russians in the war against the Bolsheviks. The U.S. troops in France in 1918 were known as the American Expeditionary Force.

The peace-time organization of a British Expeditionary Force was altered by including in it a Territorial Army Field Force. In Sept., 1939, an expeditionary force of some 150,000 regular and territorial troops, later expanded to nearly 350,000 men, crossed to the Continent. The N.W. Europe Expeditionary Force, consisting mostly

of young militiamen, went to Norway in April, 1940. The British 9th army based in Syria, Iraq, and Palestine was known as the Mediterranean Expeditionary Force, while the Anglo-American troops invading Normandy in 1944 were called the Allied Expeditionary Force (*q.v.*). But during the Second Great War the term expeditionary force was less widely used, other designations being favoured, *e.g.* Balkan Land Force, South-East Asia Command.

**Expenditure** (Lat. *ex*, out; *pendere*, to weigh). Act of paying out money. In large firms expenditure passes through the counting-house and is checked by the auditors. National expenditure is voted by the house of commons, and the expenditure of local authorities, which is under the control of finance committees and officials acting under their orders, is checked by auditors of the appropriate government department. See Accountancy.

**Experience** (Lat. *experiri*, to try). The effect upon organisms of interaction with their environments as it is interpreted by their minds. Both Plato (Republic) and Kant (Critique of Pure Reason) realized that subjective factors colour experience of the external world, but Plato exaggerated their effect upon the validity of sense knowledge, and Kant limited them to certain categories—*e.g.* cause and effect—and failed to realize the part played by such factors as instinct and emotion. Every experience modifies the attitude of the mind to subsequent stimuli, especially those of the same nature. The extreme case is the violent shock which renders a person insane.

Evolution in the animal kingdom is accompanied by an increase in the power of learning from experience. This power is almost absent in insects, but it has developed in man until he is a being possessed of reason—able by comparing, contrasting, and evaluating experiences, and drawing correct deductions from them, to arrive at accurate knowledge. One of the most important recent psychological discoveries is that all experience is stored in the unconscious mind and that much of it, in appropriate circumstances, influences subsequent conduct without there being awareness of it. See Unconscious.

**Experiment.** Testing a provisionally adopted theory by facts. The great progress of natural science in modern times has been

chiefly due to the systematic employment of experiment. Ancient philosophers and inquirers had a contempt for this method, which first received due recognition by Francis Bacon in his *Novum Organum*, 1620. An experiment may be defined as an observation which can be repeated, varied, and explained.

**Experimental Farm.** Farm at which soils, crops, the science of manuring, and other subjects cognate to agriculture are studied and from which the results of investigations are issued for the guidance of farmers. An example is Rothamsted, Herts, which was founded by Sir John Lawes in 1843 and still operates in a greatly extended form. Woburn, Beds, was

Exploder. Sectional diagram of magneto exploder. For explanation of lettering, see text

established by the Royal Agricultural Society, and later stations such as Aberystwyth, Cambridge, Corstorphine, Glasnevin, and Stormont were brought into being for the study and improvement of crop plants. East Malling and Long Ashton have made a special study of the problems of fruit growing. The National Institute of Agricultural Botany, Cambridge, was established 1919 to determine the comparative value of crop plants on a geographical basis. In the British dominions and in all foreign countries whose agriculture is sufficiently organized, experimental farms have been set up. See Agricultural Bureaux.

**Expert** (Lat. *expertus*, tried). In English law, the term used to describe one who has special skill in and knowledge of a trade or profession. Experts are often

called to give their opinions in technical cases.

**Exploder.** Term designating the electric machine for firing blasting charges fitted with electric detonators. Exploders occasionally utilise current from a set of accumulators passed through an induction coil, but the more usual machines are of the magneto type, a sectional illustration of such a machine being shown. It consists essentially of a double-wound armature, A, which can be rotated between the poles of the horseshoe magnet, B, through the free wheel pinion, C, which is actuated by the rack, having a hand grip, D, at its upper end. The free wheel ensures that the armature does not rotate as the handle is pulled up, but only when it is pushed down and the current is normally short-circuited by the switch, E. When the rack reaches the bottom of its stroke, and the armature is revolving at maximum speed, the rack opens switch E and the whole of the current passes to the main leads secured by the wing-nuts shown on the left, and thus to the detonators. A machine of this type weighs some 16 lb., and can fire simultaneously up to 100 charges.

**Exploitation** (old Fr. *exploit*, profit). Stage in the life of a mine when ore is extracted and sold, the previous stages being prospecting and development. During the earlier periods the money expended is regarded as capital invested in the business; during exploitation the revenue from sales is regarded partly as return of the capital expended and the interest thereon. See Mining; Prospecting.

**Exploits.** River of Newfoundland. The longest river in the island, it rises in the hills of Long Range and flows right across in a N.E. direction. It passes through a well-wooded district which supplies timber for the pulp mills, and on it is the town of Grand Falls. It empties itself into the Bay of Exploits, having drained about 4,000 sq. m. Its length is about 160 m., and it is navigable by steamers for 12 m.

**Exploration** (Lat. *explorare*, to search out). Literally, any kind of discovery, but the word is applied specially to discovering and making known the hitherto unknown parts of the world. There was little in the way of exploration from the time of the Greeks to almost the end of the Middle Ages.

In the 13th century something became known about China, and

Marco Polo may fairly be ranked as a pioneer of exploration. It was, however, towards the end of the 15th century that the great discoveries were made that gave a remarkable impetus to the work of the explorer. In 1492 Columbus reached the W. Indies; in 1497 Vasco da Gama rounded the Cape of Good Hope, and reached India; while about those years notable voyages were undertaken by Bartholomew Diaz, the Cabots, and others. Newfoundland was discovered; Cabral reached Brazil; Balboa saw the Pacific. From these discoveries followed the exploration of America. In the N. the lead was taken by Frenchmen, La Salle being one of the greatest names, and in the S. by the Spaniards and Portuguese. Gradually the nature and extent of the two continents were made known; the Amazon and the Mississippi were discovered and then explored, while the secrets of the wonderful Aztec civilization were revealed.

In the 18th century Australia was discovered by Captain Cook, although the Dutch Tasman had some time before found Tasmania and New Zealand. Early in the 19th century the continent was explored by Oxley, Sturt, Eyre, and a host of others. More and more was becoming known of Asia, although it was long before its central area was explored by Hedin and others, the final stage being the entry into Lhasa, 1904. In the 19th century, too, came the exploration of Africa, the work of Livingstone, Stanley, Hanning, Speke, and others among Englishmen, as well as a number of Frenchmen and Germans. The secrets of the Nile and the Congo were revealed, and soon there was little for the explorer to do.

From the time of the discovery of America, explorers had turned their attention to a north-west or north-east passage, and from this came the desire to reach the North Pole. The South Pole, too, was aimed at, and the exploration of the world's surface may be said to have ended when these goals were reached. See Antarctic Exploration; Arctic Exploration.

**Explosion.** A very rapid chemical reaction accompanied by the liberation of heat and the simultaneous liberation of gaseous products. Combustion, whether of hydrogen, petrol, or coal, is a rapid oxidation reaction, *i.e.* combustion takes place by reaction with oxygen which may come from the air or be supplied by an oxygen carrier such as sodium nitrate in

gunpowder. The high temperature produced in these reactions usually gives rise to luminosity or flame. Explosions are not always oxidation reactions; simple substances, liquid, solid, or gaseous, not containing oxygen (*e.g.* acetylene, lead azide) may explode spontaneously when suitably set off.

In certain circumstances, dust may be a contributory cause of an explosion, particularly in mills, grain elevators, or coal mines. Though not explosive in itself, coal or flour dust is highly inflammable, and if it comes into contact with flame, or even a weak electric spark, combustion takes place by reaction with the oxygen in the air. The dust nearest the source of heat is first ignited, and then the flame passes from particle to particle of the dust until it has all been consumed. The explosive force generated by dust is equivalent to that generated by the ignition of petrol vapour.

Explosions are usually the results of chemical changes, but the term is also used in reference to processes of a purely physical nature, such as the explosion of a steam boiler or the bursting of a beer bottle. These effects result solely from the sudden expansion of a high pressure or by volatilisation of liquefied gases.

#### Rate of Combustion

When a gaseous mixture, *e.g.* coal gas and air, or hydrogen and oxygen, is ignited by a hot wire or an electric spark, flame is propagated through the mixture at a uniform rate, which may vary from a few to many hundred centimetres per second. In a closed tube the initial flame speed may accelerate rapidly to a much higher constant velocity of several thousand cms./sec. This is known as detonation.

These factors determining the rates of combustion are important in connexion with the internal combustion engine and other oxidation processes. The motive power of the internal combustion engine is produced by the explosion of a mixture of inflammable hydrocarbon vapour and air in suitable proportion, and the engine's efficiency depends partly on the rate of pressure development in the explosion relative to the speed of running. Ignition of the mixture in the cylinder is produced either by a spark or by rapid compression of fuel (compression ignition). Detonation of the mixture in the cylinder gives rise to the phenomenon of "knocking" or "pinking," and is reduced by the

addition of anti-knock agents, such as lead tetraethyl, to the fuel.

**BLAST.** The destructive effect of an explosion is not restricted to the point of ignition but, owing to blast, may cover a wide area. Blast is produced by the sudden liberation into the atmosphere of gas at high pressure, blankets of air being displaced in various directions from the centre of explosion, with greater or less violence according to the intensity of the explosion. This displacement creates pockets of strong compression and suction, due only indirectly to the gaseous products of the explosion.

#### How Blast Causes Destruction

Blast is transmitted in the form of a wave, its velocity approximating to that of a sound wave in air (1,100 ft. per sec.). This creates a change in the air pressure, and the positive change so created in the normal air pressure is much greater than the negative, as the actual pressure can never fall below zero. Thus blast first creates a pressure wave against any object in its path; then, as the wave is dissipated and the natural atmospheric pressure returns to normal, a partial vacuum is created which acts as a sudden pull against the affected object. Although the suction is weaker than the original pressure, it lasts several times as long, and normally does damage to objects which had not time to weaken under the usually brief initial pressure. Frequently it is the pull that causes destruction. Provided the pressure wave lasts long enough, it will set up vibration in the objects in its path and they will oscillate in sympathy with the following pull when it arrives. In other words, objects and pull will be in resonance, and the former will collapse. Objects built of timber or having many joints have a high frequency of vibration and are more liable to be ruptured by blast than those of low frequency; a solidly built concrete structure has low frequency and is therefore resistant to blast. It is the dual push-and-pull action of blast on obstacles in its path that produces contradictory effects. Some buildings in the blast area may be destroyed by the initial forward movement of the pressure wave and fall before it, while others will collapse under the pull effect in the opposite direction.

Blast generally spreads outwards with a steep incline at the point of initial explosion, but quickly curves back towards the ground.

This explains why objects in the immediate vicinity of impact may be unaffected, while buildings some distance away will collapse.

The intensity of blast of a shell or bomb is governed by five factors: the type of explosive, the size of the projectile, the detonation velocity (*i.e.* the wave motion through the mass of the explosive), the thickness of the bomb or shell casing, and the type of ground upon which the projectile falls. For a given weight and type of explosive, a thin-cased bomb has a greater blast effect than one with a thick case; while any bomb falling on soft ground has a lower blast effect than one making contact with a hard surface, such as concrete or steel. Owing to the enormous pressure generated by an atomic bomb (*q.v.*) explosion, objects in the path of the blast are usually destroyed by the initial pressure wave, so that most objects have already collapsed when the pressure drops and the pull in the opposite direction is exerted.

Animal and human victims of blast are killed either by the concussion of the initial pressure wave or by the pulling effect created by the resultant vacuum. In the latter event the air is extracted from the body; the lungs collapse and the internal organs break up owing to the evacuation of the air supporting their interiors. This causes death, and such victims of blast show no outward sign of injury.

The high pressure wave generated by an explosion striking the Corti organ of the ear gives the impression of a loud sound at the seat of the explosion. Actually, the noise of detonation is not generated by the explosion, but is received by each hearer individually according to the path of the pressure wave. Thus, a person some distance from the explosion may hear a very **loud** noise, whereas another person, closer to the explosion, but shielded by a building or rising ground, receives a much weaker sound impression.

High explosives differ a great deal from one another in their sensitiveness to detonation. Blasting gelatine may be set off by the detonation of a sensitive explosive, placed in close contact with it. Such "initiator explosives" are generally used either alone or in mixtures in detonators. The most important members of this class are mercury fulminate and lead azide. Many high explosives require the interposition between the detonator and the high explosive of a sensitive explosive called an "exploder," "booster," or "gaine."

**HISTORY.** The early history of explosives and their actual invention is a matter of much speculation. Gunpowder is certainly the oldest. It is sometimes connected with "Greek fire," used in the Byzantine period, but it is doubtful whether saltpetre of sufficient purity was known at the time. Saltpetre was known to the Chinese and Arabic people about 1200, and they used it in fireworks for military purposes. Roger Bacon (1214-94) in his writings made undoubted references to gunpowder, using a cipher to conceal instructions for its manufacture, and he was acquainted with the fact that it explodes violently when ignited in confinement. The use of gunpowder for the propulsion of missiles from guns is said to have been introduced by a German monk, Berthold Schwartz. Old manuscripts record different dates for this event; but guns were certainly in use by 1320.

For some six centuries gunpowder remained the only known explosive, and its composition remained almost unchanged, saltpetre, charcoal, and sulphur being the ingredients, in varied proportions. Its progress from an uncertain, irregular medium to a uniform and reliable explosive was due to improved manufacturing methods and greater purity of ingredients, this tending to more intimate contact of the components and consequently to faster and more regular burning.

In 1846, nitrocellulose and nitroglycerine were discovered, the former simultaneously by two Germans, Schönbein and Böttcher, and the latter by an Italian, Sobrero. Both proved to be extremely violent explosives, incomparably more powerful than gunpowder. The reason for this is that both are chemical compounds, the oxidiser and combustible being combined in the same molecule, and hence in the

## EXPLOSIVES: IN PEACE AND WAR

C. E. H. Bawn, Ph.D., Dept. of Chemistry, University of Bristol

*In addition to this general article, this work contains articles on special explosives, e.g. Dynamite; Gunpowder; Picric Acid; Trinitrotoluene, etc. See also Ammunition; Artillery; Explosive; Fuse; Gas, etc.*

Explosives (Lat. *explosus*, driven out) are solids or liquids or mixtures which, when chemical change is initiated at any point within them by heat or by a blow, can be converted in a very short time into stable substances that are wholly or mainly gaseous. The disruptive or propulsive effect of the explosive is produced by the sudden formation of gaseous products at a high temperature. The name "explosive" is limited by custom to solids or liquids, although many gaseous reactions are truly explosive. The production of gases at a high temperature, some of which are also readily combustible on admixture with the outside air, gives rise to the flame usually associated with explosion, although certain compounds, such as azide, explode without visible flame. In blasting explosives, the chemical reactions involved are oxidations; one constituent of the powder is oxidised by the oxygen contained in another (for example, the charcoal in gunpowder is oxidised by the potassium nitrate) or one portion of the chemical compound oxidises another portion of itself, as in the explosion of nitroglycerine or trinitrotoluene (T.N.T.). The explosion results from the fact that

the chemical changes occurring give out heat and that the reaction, once started, becomes self-supporting and spreads rapidly throughout the mass.

Many explosives, *e.g.* T.N.T., will burn quietly when ignited by a flame in an open space; others, such as mercury fulminate or lead azide, explode violently under whatever condition they are ignited. The latter substances also explode when struck by a hammer. Other initiating agencies include friction or rubbing, electric sparks, shock from an adjacent explosion. Differences in behaviour of explosives are due to their different speeds of reaction, resulting from the nature of the substance and the type of initiation of explosion: the explosion of gunpowder or cordite, even when strongly confined, is essentially a rapid burning, whereas with mercury fulminate or confined T.N.T. a very short period of burning rapidly culminates in a violent explosion with the production of an intense shock wave which is known as a detonation. These differences in speed of reaction determine the use of the explosive to produce a propulsive (propellant) or disruptive (high explosive) effect.

closest possible contact, far closer than can be achieved by mechanical mixture in gunpowder. They are types of a distinct class of explosives, termed the nitric esters, in which the hydroxyl groups (OH) of the raw material are more or less completely replaced by nitrate groups ( $\text{ONO}_2$ ) during nitration.

#### Nobel's Discoveries

Attempts to use these new substances commercially showed a number of unexpected difficulties. One problem was how to ignite them. A spark or flame had been the accepted method of firing gunpowder, but was inadequate for the new explosives which, however, were easily exploded by percussion. The ignition problem was solved by a Swedish chemist, Alfred Nobel (*q.v.*) who, in 1864, showed that mercury fulminate, previously used only in percussion caps for firing gunpowder, when exploded by a spark initiated complete detonation in nitroglycerine. Nobel's discovery, a landmark in explosives science, made possible the use of most modern high explosives.

Nitroglycerine is highly sensitive to percussion, and so many accidents attended its early manufacture and use that in many countries it was prohibited as a blasting explosive. After a number of dangerous experiments, Nobel in 1867 discovered that kieselguhr will absorb about three times its weight of nitroglycerine, yielding a plastic mass of sufficient insensitivity which he named dynamite. Its rapid adoption founded Nobel's fortune. Nitrocellulose in the form of guncotton began to be used as a military blasting explosive in 1868. Neither of the new explosives, however, could be used in guns, being too violent in their action, whilst they were too sensitive for shell fillings. Mixtures of ammonium nitrate with various combustibles, introduced in 1867, were found too insensitive for use as explosives until nitroglycerine was added. Another class of explosive—mixtures of nitric acid with organic combustibles—was invented by Sprengel in 1871, their essential feature being that the ingredients were non-explosive until mixed just before use. These were used for blasting on the Continent until replaced by more permanent solid compositions.

Sprengel also experimented with picric acid, or trinitrophenol, in 1871, but this explosive was not taken up until 1885, when Turpin proposed its use for shell filling.

The first high explosive sufficiently insensitive for this purpose, it belongs to a new class—the nitro derivatives of the aromatic hydrocarbons. Smokeless powder (nitrocellulose whose structure has been modified by gelatinisation) was used successfully as a propellant for sporting gun ammunition in 1865, and for military purposes in 1884. Its decomposition in this form was extremely rapid combustion rather than explosion.

Picric acid was found to be liable to form picrates, which are sensitive, and in itself proved somewhat too sensitive for use in shells for large guns. Nitration of other aromatic hydrocarbons was therefore attempted, but did not become a commercial success until the manufacture of cheap, highly concentrated sulphuric acid was a commercial possibility. Trinitrotoluene then sprang into prominence, becoming the basis of military high explosives.

#### Types of High Explosives

High explosives are of two classes: (1) primary or initiator explosives, which are very sensitive and detonate when heated or subjected to shock, such as a blow; (2) secondary explosives, which detonate under the influence of shock from a detonated, initiating, or another secondary high explosive. The initiatory type of explosive is used almost entirely in making detonators or caps, whilst those of the secondary type are used to fill shells, bombs, mines, and torpedoes, and for blasting.

MILITARY HIGH EXPLOSIVES are few in number, the principal being trinitrotoluene (T.N.T.), picric acid, tetryl (C.E.), amatol (ammonium nitrate-T.N.T. mixture), ammonium picrate, hexyl, R.D.X. (cyclonite), and penta-erythritol tetranitrate (P.E.T.N.).

An explosive must conform to very stringent standards before it is acceptable for military purposes. Besides possessing the necessary power, it must be (1) sufficiently insensitive to shock and blow for safe handling in the field and in the factory, (2) resistant to deterioration on long storage in filled weapons, and (3) non-poisonous, non-volatile, stable, and non-absorbent of moisture. Easy production from available materials is also desirable.

During the Second Great War, several new explosives were developed, especially to meet new and specific requirements such as demolition of large fortifications, penetration of heavy armour and concrete, and the production of

high blast effect. Among the more important of these were R.D.X. (used in depth charges) and P.E.T.N. The older explosives, T.N.T., amatol, picric acid, tetryl, and hexyl, developed during the First Great War were, however, used more extensively. The very high demand for explosives during the war resulted in the loading of ammunition on a mass production scale by the use of melt or cast loading, in which the high melting explosive, *e.g.* ammonium nitrate or R.D.X., was mixed with the lower melting T.N.T., the weapon being filled with the resulting thick slurry. Aluminium powder was often used in addition in these explosives, to enhance the blast and incendiary effect of the filling.

BLASTING EXPLOSIVES are extensively used in mines and quarries and in civil engineering to supplement the work of man and machine in breaking down for removal rock, coal, or other material. They are divided into two groups, (1) permitted, those whose use is allowed in coal and other mines where there is danger of explosions of firedamp and air and of coal-dust and air, (2) non-permitted, use of which is allowed only in quarries and for other open work where there is no danger of gaseous or dust explosion. Explosives must pass a stringent government test before they are placed on the Home office and Board of Trade lists (published annually) of permitted explosives.

#### Materials for Blasting Operations

Blasting explosives can be classified according to whether their sensitive explosive component is nitroglycerine or another high explosive material. Nitroglycerine explosives are subdivided according to their physical state into gelatines, semi-gelatines, and powders; and into permitted and non-permitted explosives. Nitroglycerine freezes at  $13^\circ\text{C}$ . ( $55^\circ\text{F}$ .) and at that temperature all explosives containing it freeze to a hard mass unsuitable for use. Failures from this cause have led to accidents, and all nitroglycerine explosives used in Great Britain are therefore of low freezing type, *i.e.*, they do not freeze at any temperature likely to be encountered in that country. This is achieved by replacing about  $\frac{1}{4}$  of the weight of nitroglycerine by nitroglycol, and the term N/G in this article is used for this mixture.

The parent gelatine in blasting gelatine is the strongest known

commercial explosive; it contains over 90 p.c. N/G, the remainder being nitrocellulose with a small quantity of stabiliser. Other gelatine compositions have been developed by replacing part of the N/G by other oxidising ingredients such as potassium nitrate, sodium nitrate and ammonium nitrate, carbonaceous material such as wood meal being added to take up the excess oxygen liberated in the explosion. Permitted gelatines are made by incorporating into the non-permitted a fairly large quantity of inert substance—sodium chloride is generally used—which reduces the temperature and also the power of the explosion. Semi-gelatines contain a higher proportion of solid ingredients than the gelatines, but the powder is still bound by a nitroglycerine jelly. The ammonia dynamites, in which ammonium nitrate provides the chief source of power, belong to this class. The original nitroglycerine blasting powder was dynamite, which consists of N/G absorbed by a siliceous earth, kieselguhr. Since the latter substance is inert and reduces the power, combustible absorbents were developed, mixed with sodium nitrate as oxidising agent. Most of the nitroglycerine was later replaced by ammonium nitrate, an explosive substance as well as an oxidising agent, but sufficient nitroglycerine was left to sensitise the mixture.

In the non-nitroglycerine type of blasting explosive, the sensitiser is usually T.N.T., which is mixed with a metallic nitrate or ammonium nitrate to compensate for its lack of oxygen. Permitted non-nitroglycerine explosives are made by the incorporation of salt into the composition.

PROPELLANTS are self-combustible materials which, on ignition and acting against a movable resistance such as a bullet or shell in a gun barrel, produce by virtue of the production of gases at high pressure and temperature a propulsive effect. Such explosives on initiation by a cap give a rapid combustion, the rate of which is markedly dependent on pressure, but very many times lower than the velocity of detonation of high explosives. Propellants in actual use are based upon nitrocellulose; many powders contain in addition nitroglycerine and other explosives.

Gun-cotton and collodion cotton can be used in their fibrous form, but in service propellants of the cordite type, and in many non-military powders, the fibrous structure of the nitrocellulose is to a

considerable extent destroyed by collodizing (gelatinising) with a solvent for nitrocellulose. Propellants are classified as single or double base powders, according to whether they contain nitrocellulose alone or with other explosives. American service powders are, in the main, single base, whereas in British cordites the nitrocellulose is gelatinised with the powerful explosive nitroglycerine.

Besides the main ingredient and stabilisers to increase the keeping properties of the propellant, other substances are added for special purposes. Some powders contain "flash reducers," which act as cooling agents and serve to prevent the blinding flash which occurs when the hot combustible gases leaving the muzzle of the gun mix with the external air. Flashless charges developed during the Second Great War made it possible to fire at night-time without disclosure of the position of the gun. Moderants or deadeners such as oils or wax are sometimes added to control the speed of combustion. Military gun propellants are made by an extrusion process in the form of threads, tubes (single or multi-perforated) which vary in size from  $\frac{1}{16}$  in. to  $\frac{1}{2}$  in. or more according to the size of the gun, and the shell velocity required.

Small arms propellants usually consist of a bundle of thin cordite sticks or threads.

#### Second Great War Developments

Liquid rocket propellants were developed during the Second Great War. Fuel and oxidant, carried in separate tanks, were forced into the combustion chamber. The products of combustion, on passing out through a jet, provided the propulsive action, as in a normal rocket based on a powder propellant. In the German rocket (V 2), whose range was about 200 miles, the liquids used were liquid oxygen and alcohol. Another major fuel development during the war was the production of concentrated hydrogen peroxide, which could be decomposed almost instantaneously to give oxygen and steam when permanganate solution was mixed with it. The superheated steam plus oxygen generated was used to operate the turbine fuel pumps of the V 2 and for the direct propulsion of a rocket-propelled glider bomb. The German rocket-propelled fighter—the Me 163—was operated on the bi-fuel system—hydrogen peroxide (T-Stoff), and a mixture of hydrazine hydrate and alcohol (C-Stoff). The latter was also used as cooling agent.

Non-military propellants, used for shot-gun, revolver, and rifle powder (sporting powders), and also for power purposes, are, like military powders, based on nitrocellulose and may be classified in three main groups on the basis of their composition and physical structure:

#### Propellants for Civilian Purposes

(1) Fibrous nitrocellulose (N/C) powders, in which the N/C substantially retains its fibrous structure. These are fast powders and are used in shot-guns which require low operating pressure and low resistance. The powders are prepared in granular form suitable for easy loading into the cartridge. The term bulk powder is often used in connection with shot-gun powders and derives from the time when black powder, which is still used to some extent, was the standard shot-gun powder. The standard charge of gunpowder was 3 drams, and the charge was measured by volume in a container designed to give this weight of charge. When smokeless powders were introduced they were designed to occupy at the required weights the standard volume of the 3-dram black powder measure. Thus, a 33-grain powder is one in which 33 grains, the charge necessary for standard ballistics, occupies the volume of the standard black powder measure. The difference in the rate of burning of powder of any one class is broadly determined by the amount of inert material used in the make-up of the powders.

(2) Gelatinised nitrocellulose powders in which the fibrous structure of the N/C is to a considerable extent destroyed by gelatinising with a solvent for the N/C. The dough-like mix resulting is extruded through suitable dies and cut to the required granulation, and the volatile solvent removed by stoving or steeping in water. These powders are often made porous by the incorporation of soluble salts which are subsequently leached out by water. The effect is to increase the effective burning area and produce a powder giving a fast rate of gas production. Revolver powders and powder for .22 rimfire ammunition are gelatinised porous powders based on N/C.

(3) Gelatinised nitrocellulose-nitroglycerine powders, in which the N/C is gelatinised by the high energy explosive nitroglycerine, are similar to military cordites. The so-called "express" sporting rifles used loads of this nature.

Double base powders are rendered porous in the same way as the gelatinised single base powders.

The gelatinisation of nitrocellulose by nitroglycerine can be brought about by heat and pressure alone; for example, by working on hot rolls, without the aid of volatile solvent. The sheets so obtained can be coiled and extruded from hydraulic presses, under conditions of vacuum pressing to exclude air, through suitable dies. This is often essential in producing the large sizes of propellant required for power cartridges. These are not for use in firearms at all, where the time of operation is measured in thousandths of a second, but are specially designed for applications of gas pressure in the engineering field involving much longer times of operation, from tenths of a second to 2 minutes. Such cartridges and charges are used for propelling military rockets, assisting take-off of aircraft, starting aeroplane or other engines, lowering aeroplane undercarriages, etc. In fully gelatinised propellants of this type, burning takes place from the surface in parallel layers. For the longer burning times, the so-called "wrapped cordite charge" is used in which all but one end of a cordite rod is protected by a relatively incombustible tape wrapping, so that the cordite burns from one end only like a cigarette. In this way the factor controlling the burning time becomes the length of the cordite stick instead of its diameter, and the burning time is limited only by restrictions on the size of the apparatus used.

**Bibliography.** Explosive Materials, M. P. E. Berthelot, Eng. trans. M. Benjamin, 1883; Manufacture of Explosives, O. Guttman, 1895: with supplement, 1909; Explosives, H. Brunswick, Eng. trans. C. E. Monroe, and A. L. Kibler, 1912; Les Poudres et Explosifs, L. Vennin and G. Chesneau, 1914; Explosives, A. Marshall, 2nd ed. 1917, supp. vol. 1923; Notes on Military Explosives, E. M. Weaver, 4th ed. 1917; High Explosives, E. de W. S. Colver, 1918; Chemistry of Powder and Explosives, T. L. Davis, 1941; Explosives, J. Read, 1942.

**Explosives Law.** A new Act concerning explosives was passed in England in 1860, and amended in 1861 and 1862, repealing all previous Acts. In 1875 a new Explosives Act was passed dealing comprehensively with the whole question. This was based on the report of the house of commons committee appointed to inquire into the terrible explosion on the Regent's Canal in 1874, and still

governs the whole question. Part I deals with gunpowder, which may be manufactured only in licensed factories and kept in licensed magazines under specified conditions. Part II deals similarly with nitroglycerine, and other high explosives; Part III with inspection, accidents, search, etc.; and Part IV gives supplementary provisions. Regulations concerning the use of explosives for blasting in Great Britain are laid down in the above Act, the Quarries Act of 1894, the Coal Mines Act of 1911, and the Mining Industry Act of 1920. The term explosive may include any substance deemed to be specially dangerous to life. Because many of the newer explosives are of a poisonous nature, regulations can also be made to safeguard the health of workers. Most other countries have introduced similar legislation. The Merchant Shipping Act of 1894 regulates the carrying of explosives in British vessels.

**Exponent** (Lat. *ex*, from, out; *ponere*, to place). Symbol of an algebraic expression denoting the number of times the expression is to be multiplied by itself. Thus in the expression  $a^3$ , the figure 3 is the exponent of  $a$ , and the expression is equivalent to  $a \times a \times a$ .

**Exponential.** A term used in mathematics. The exponential function is the inverse of the logarithm: thus if  $y = \log x$ , then  $x$  is said to be the exponential of  $y$ . See Logarithms.

**Exports** (Lat. *ex*, from, out; *portare*, to carry). Commodities sent to foreign countries in the course of trade. In the U.K. exports are valued at a figure that includes all charges up to the point at which they are on board the exporting ship, while imports are valued at a figure that includes, in addition, insurance and freight. Before a true comparison can be made between total exports and total imports, the relevant costs of insurance and freight must therefore be added to the recorded value of exports. Current practice takes into account other financial factors not normally recorded in the trade figures. This makes it possible to calculate a periodical balance of payments, which is more important than the mere balance of exports and imports.

United Kingdom exports are classified by the Board of Trade thus: food, drink, and tobacco; raw materials; manufactured articles; parcel post. In the first class the chief exports are beverages, fish, sugar; in the second,

coal; in the third, pottery, iron and steel goods, machinery, vehicles, chemicals, textiles. The chief customers for exports of the U.K. are India, Australia, the U.S.A., Canada, Argentina, and the U.S.S.R.

In measuring increases and decreases in the total value of exports from year to year, differences in the purchasing power of money must be taken into account. A total of £393 millions in 1945, when corrected for price changes, becomes only £214 millions at 1938 prices, in which year exports were valued at £471 millions—a much less favourable ratio.

Since 1913 the normal course of international trade has been completely interrupted by the impact of war, and like other countries the U.K. suffered a decline in exports. She became for the first time a debtor nation and had to raise foreign loans; coal, hitherto her great export, was partly superseded by oil and electrical energy; and countries that had for centuries taken her manufactures were now providing their own. By developing her vast resources the U.S.A. became a formidable rival. Despite these difficulties, the conclusion of the Second Great War saw the core of British export trade still sound; taking the 1938 volume as 100, the volume of exports in 1946 was 99.3 and in 1948 was 136.3. The end of the war saw also the beginning of attempts at international regulation of trade by conventions, e.g. at Bretton Woods (*q.v.*). See Invisible Exports.

**Exposition** (Lat. *exponere*, to set forth). In music, the placing out or setting forth of the themes and materials upon which a piece is constructed. In fugue the exposition includes the first entries of all the voices or parts. In sonata form it includes the first presentation of the chief themes, before their development or elaboration is entered upon. See Fugue; Sonata.

**Exposure.** In photography, the amount of light passed by a lens; or, in photographic contact, printing, the amount of light, passed by the negative, which is allowed to influence the sensitive material. It is usually expressed as a period of time, subject to known factors of type and intensity of light. For any particular sensitive material and standard development conditions a curve may be plotted to show the relative increase of density or blackening with increasing exposure. This is known as the characteristic

curve of the emulsion in question. Correct exposure is that which confines the range of densities in the subject to the straight line portion of the curve.

The factors affecting exposure may be divided into those values capable of reasonably accurate measurement and those difficult to assess. The first class includes (1) the speed of the sensitive material in use for a certain type of light; (2) the aperture of the lens; (3) the effective speed of the shutter; (4) such factors as geographical latitude, period of year, and time of day. The second class includes (1) the actual intensity of light falling upon the subject; (2) the light reflected—this latter is governed by the type of subject.

**EXPOSURE METER, or Calculator.** This estimates correct exposure. It may take one of many forms. Calculators take into consideration all the factors of the first class enumerated above and any modification due to use of filters; but the actual brightness of light and type of subject are left to individual judgement. Actinometers improve on this by seeking to measure the brightness of the light falling upon the subject. In the Bee and Wynne meters this is ascertained by noting the time required for a piece of specially sensitised paper to darken to the same density as a permanent tint placed alongside it. Visual extinction meters measure the amount of light reflected from the subject by inspection of a series of figures or letters, light on a dark ground, of decreasing densities in a darkened chamber provided with an eye-piece at one end and directed towards the subject. Photo-electric exposure meters measure the intensity of the light falling upon or reflected from the subject by purely physical means, containing a sensitive cell which, when light falls upon it, generates an electric current of a magnitude proportionate to the intensity of the light.

No type of exposure meter will give entirely accurate results under all conditions; intelligent judgement must be exercised in relation to the type of subject. Even the photo-electric system derives light for its reading almost entirely from the highlights, and it is the relative depth of the shadows, of which the meter takes no account, which is the final determining factor.

**Express System.** Name for a special delivery service for letters and parcels provided by the general post office in the U.K.

Letters and parcels that are conspicuously marked "express" above the address may be handed over the counter at post offices that deliver telegrams, whence they will be taken to their destination by a telegraph messenger. The charge is 6d. a mile, with a surcharge of 1d. on each separate letter or packet after the first. Live animals, liquids, or money can be delivered by the service. The delivery also applies to letters transmitted by post and delivered by special messenger; the charge is 6d. additional to ordinary postage. Special delivery is also made of messages telephoned to a post office; the charge is 6d. a mile.

**Expression, FACIAL.** Outward indication on the features of the inward character or emotions. Sir Charles Bell first put the matter on a scientific basis in his essay on the Anatomy of Expression in Painting, 1806. Continental writers followed, but the classic work on the subject is Darwin's Expression of the Emotions in Man and Animals, 1872, in which are set forth physiological reasons for the variety of expression of which human faces, and in a lesser degree the faces of animals, are capable.

Darwin maintains that some human expressions, such as the bristling of the hair under the influence of extreme terror, or the uncovering of the teeth under that of furious rage, can be understood only on the assumption that man once existed in a much lower and animal-like condition. He thinks the movement of the same facial muscles during laughter by man and by various monkeys indicates descent from a common ancestor. *See Acting, illus.*

**Expressionism.** Art movement. As applied to the drama of ideas, expressionism was concerned chiefly with the unfamiliar in subject matter. It enlarged the scope of drama, the basic principle being that no human experience is outside the range of dramatic treatment. Such 19th century dramatists as Strindberg and Ibsen were the precursors of the movement, though Strindberg wrote many years before the term had been introduced by German critics. In his Spook Sonata, The Dance of Death, and The Father, types rather than individuals dominate the scene. In Germany, Kaiser's Gas, and Toller's Man and the Masses, were distinguished examples of expressionistic symbolism. These plays influenced a whole school of later writers in the experimental theatre of the 1920s

and 1930s. Pirandello's Six Characters in Search of an Author (one of the most original contributions to expressionistic drama), Capek's R.U.R., O'Casey's The Silver Tassie, Auden's and Isherwood's The Dog Beneath the Skin, Priestley's Johnson over Jordan, all depend for their effect upon unfamiliarity of treatment.

In painting, abstract expressionism developed in Germany shortly before and after the First Great War. Evolved in 1908 by Kokoschka in Vienna and Pechstein in Berlin, a crude form of expressionism, as yet uninfluenced by the Cubists, served as a reaction against impressionism. In Great Britain, France, and the U.S.A., this movement was termed post-impressionism (*q.v.*). The influence of Cézanne, Gauguin, and van Gogh was at first predominant, but expressionism later adopted a semi-cubist manner as exemplified in the work of Franz Marc, i.e. forms based on architecture and three-dimensional geometry. The Russians Kandinsky and Javlenky gave impetus to the German painters. Klee, whose preoccupation with pattern and colour represented a more subtle form, influenced younger schools of painters. An attempt was made by later expressionists to return to more naturalistic forms, this development receiving an impulse from the naïve-realistic manner of Henri Rousseau.

**Express Rifle.** Name given to a heavy sporting rifle introduced in 1856 and since developed into a number of types used for big game, especially elephant hunting. Express rifles vary in calibre from 0.303 in. to 1.052 ins. The weight of the barrel varies from 6 to 16.5 lb., and the length from 22 ins. to 30 ins. The range varies between 250-500 yds. Certain types of express rifle are double-barrelled.

**Extended Order.** A military formation in which the ranks and files of troops on parade are separated by a distance of two paces. The term is also applied to troops advancing to the attack and dispersed over as wide an area as possible so that they will not offer an easy target.

**Extension.** Term used in engineering for the stretching of materials under tension. Every material stretches under a pull, though the amount may be relatively small. A bar of wrought iron one inch square will stretch only one twelve-thousandth of an inch with a pull of a ton upon it. Heat causes expansion, but this

should not be confused with extension in engineering. Within the elastic limit of the material the strain is directly proportional to the stress which produces it. The strain is defined as the ratio of the extension to the original length of the bar. The ratio of the stress to the strain is an important constant for any solid and is called the modulus of elasticity of the material. If a solid is stretched beyond its elastic limit it does not return to its original length.

**Extensometer.** An instrument used in engineering and metallurgical design. It is often necessary to measure accurately the minute elastic extension of materials, in order to forecast their behaviour during usage. On a steel test piece two inches long this may be less than 0.003 inches, so very delicate measuring instruments must be used, of which the extensometer is one.

**Extent.** In law, a writ of execution to recover crown debts. The extent in chief was issued by the crown against the body, lands, goods, or other property of the debtor. The extent in aid was issued by a crown debtor against his own debtor so that he might be able to pay his debt to the crown. These writs are rare at the present day.

**Extenuating Circumstances.** Term used in English law. A jury may add a rider to a verdict of guilty that there were extenuating circumstances in favour of the prisoner. The judge may take this into account in the sentence, except in cases of murder and high treason, when he is bound to pass the capital sentence. In France, "Guilty with extenuating circumstances" is a different verdict from guilty; and the sentence is different.

**Extortion** (Lat. *ex*, out; *torquere*, to twist). In English law, a demand by an official, or someone else performing a public service, of money in excess of the amount due, or of money not yet due. It is applied by an extension to the act of obtaining money by means of threats, the offence known as blackmail. Extortion in the strict sense is punishable by fine and imprisonment, a number of statutes having forbidden it. Other forms may become robbery and be punished as such.

**Extract** (Lat. *extractus*, drawn out). Term applied, in chemistry and pharmaceuticals, to products obtained by treating any substance with solvents and then evaporating

the latter. In a more restricted sense, an extract is a concentrated form of a vegetable drug. It contains the active part of the drug, the inert portion, consisting of woody fibre, being exhausted of its active principles during the process of extraction.

The various operations involved in extraction have received special names. Infusion is the process of allowing a drug to remain in contact with hot or cold water for definite periods of time; if the solvent is boiled during the period the process is decoction. In another common method, known as percolation, the comminuted drug is placed in a conical vessel and the solvent slowly passed through it. To reduce the liquid to a more concentrated form it is evaporated by heat. The extracts prepared in pharmacy are either thick liquids or soft pastes. The pastes are used as ingredients in making pills and lozenges.

**Extradition** (Lat. *ex*, out; *traditio*, handing over). Term used in law for the surrender, by one state to another, of fugitive criminals. As between the states, this depends on treaty; no state has an inherent right, apart from express agreement, to claim extraditory rights from another. Treaties for extradition now exist between most civilized states, but political criminals are invariably excepted from their operation. The manner in which extradition is applied for and granted depends upon the law of the country where the fugitive is. In England it is governed by the Extradition Acts, 1870-1935, which apply in relation to foreign countries, and the Fugitive Offenders Act, 1881, which applies within the British Empire.

By these Acts, a fugitive offender is not to be surrendered unless the foreign state concerned undertakes to try him only on the charge on which he is extradited. The fugitive is to be brought before a magistrate, who must be satisfied that the alleged offence is not political, and is one of the crimes for which extradition can be claimed. These offences range from murder to bribery. If the magistrate decides that the case is made out, he commits the alleged offender to prison, and then a secretary of state makes an order for the gaoler to hand him over to the representative of the foreign state. See International Law.

**Extragalactic Nebulae.** Systems consisting of thousands of millions of stars held together by

their mutual gravitational attractions but entirely separate from and in no way connected with the Milky Way. It is estimated that there are many millions of these objects within the reach of the biggest telescopes, and, together with the Galaxy, which is probably fairly typical of them, they constitute the whole known universe. See Nebula.

**Extra-Mural Education.** Literally, education "outside the walls." The term is applied to all activities of a university which aim at extending directly its teaching and influence among those members of the community who would not otherwise have the advantage of contact with university teachers or experience of a course of study of university type. After centuries in which Oxford and Cambridge were as indifferent to the intellectual condition of the masses as these were ignorant of the universities, during the second half of the 19th century a great change took place. Scientific discoveries, the spread of the ability to read, the awakening of the public conscience by Shaftesbury, Ruskin, Jowett, T. H. Green, etc., induced in some of the finest scholars of Oxford and Cambridge the desire to propagate culture. In 1871 the religious tests were abolished which had hitherto kept dissenters out of Oxford and Cambridge. In 1872 the university extension movement began, providing courses of evening lectures of university standard for working men and women, principally on non-technical subjects. Eventually such lectures were arranged in most large towns and even in villages, their success probably helping much to stimulate the establishment of the provincial universities.

But university extension classes affected only those among the working class already converted to the value of education. They left the masses untouched. University settlements were begun in London, first at Toynbee Hall in 1884, and then in Camberwell, Bermondsey, Bethnal Green, etc.; subsequently in other cities. Today every university in Great Britain and some in America have settlements or missions which link academic work in practical fashion to the social problems of the time. Some of the best known politicians, clergymen, lawyers, and authors served apprenticeship in a university settlement. In 1903 the Workers' Educational Association (*q.v.*) was founded by

Albert Mansbridge, and it has cooperated with the universities in extra-mural education.

**Extraterritoriality.** A term used in international law. It describes the status of a person who, when in foreign territory, is immune from the jurisdiction of local laws and courts. Sovereigns and diplomatic agents are considered such persons by ancient usage. If a sovereign is abroad, his house is extraterritorial; and the official residence of an ambassador is, by courtesy, part of the country which he represents. Hence no arrest can be made there under a local warrant; nor is the house assessable to rates and taxes. Sometimes by treaty all the subjects of one state residing in another are made extraterritorial for purposes of justice. A ship of war in a foreign harbour, behaving peacefully, remains a part of the country whose flag she flies; and a military force in a foreign country is not subject to the laws of that country except by agreement: e.g. the British army in France during the First Great War was subject not to French but to English military law, and during the Second Great War reciprocal arrangements were made, e.g. in respect of American forces in Great Britain and British forces in the U.S.A. The system whereby extraterritoriality was granted to European subjects in Eastern countries has been brought to an end. In China extraterritorial rights were relinquished by treaties negotiated in 1943-44.

**Extravasation** (Lat. *extra*, outside, beyond; *vas*, vessel). Outpouring of fluid into the tissues from an injured vessel. The most familiar example is the extravasation of blood which may follow a blow on the skin resulting in the formation of a bruise.

**Extreme Unction** OR SACRAMENT OF THE DYING. Fifth of the seven sacraments of the Roman Catholic Church. It was instituted for the spiritual and bodily comfort of those in *extremis*. Recognized also in the Greek, Coptic, Armenian, and Nestorian Churches, with varying ceremonial, and dating from the 12th century, it is regarded as authorised by James 5, vv. 14-15, and is administered by the priest, who anoints the dying person.

Unction is usually applied to the seat of each of the five senses, with prayer, e.g. "Through this holy unction, and His most tender mercy, may the Lord pardon thee whatever sins thou has committed

by seeing. Amen." With the other senses the necessary word is used in place of "seeing." In Roman usage the oil is applied in the form of a cross, after reception of the Viaticum or Holy Communion. In the Church of England the rite was abolished in 1552. See Sacrament.

**Extrovert.** Psychological term used by Jung. It and its opposite, introvert, denote the two types of temperament into which he divided the human race. The extrovert is interested in external reality and adapts himself to it; the introvert is interested in his own personality, needs, etc., and tries by day-dreaming, wishful thinking, and similar devices to adjust reality to himself. The distinction is of little scientific value since (a) most human beings fall between the two types, and (b) the reactions themselves are not fundamental traits, but depend upon whether the environment is pleasant, terrifying, etc. Consult Psychological Types, C. G. Jung, 1923.

**Extrusion.** Process used in the fabrication of glass, plastics, viscose, and metals into rods, channels, threads, and wires. In metals, a billet is heated until pliable; for aluminium and its alloys 300-400° C. would suffice, for brasses about 800° C. While still hot it is placed in a preheated container in a press, which is operated either mechanically or hydraulically, in either of two ways. In the direct process, the fixed end of the container carries a die, shaped to form the extruded cross-section desired; the other end is a pad, only slightly smaller than the inside of the container in diameter, and behind the pad is a ram. When pressure is applied to the ram the pliable material is forced through the die, and so shaped. The inverted process employs a moving die in place of the ram and

pad, the die being forced into the billet which remains stationary in the container. Tube may be extruded by piercing the billet with a plunger before extrusion and then using the plunger as a mandrel. Very high pressures are employed and 1,000-ton hydraulic presses are common. See Glass; Plastics; Silk, Artificial.

**Exuma.** Two of the Bahama Islands, known as Great and Little. They lie S.E. of Andros Island and W. of Long Island. Great Exuma is 30 m. in length and contains the chief settlement, Georgetown. Total pop. 3,774.

**Eyam.** Parish and village of Derbyshire, England. It stands in Eyam Dale, 5 m. N. of Bakewell. In the churchyard is a Runic cross, and there are several barrows, one of which, on Eyam Edge, is more than 100 ft. in diameter. During the plague of 1665-66 the inhabitants voluntarily cut themselves off from the outside world and most of them perished. *Pron.* Eem.

**Eyck, HUBERT VAN** (c. 1366-1426). Flemish painter. He was born at Maeseyck, in the prov. of Limburg. Before settling at Ghent as court painter, early in the 15th cent., he spent some time in N. Italy. He probably began, and his brother Jan certainly completed the

Hubert van Eyck,

National Gallery, London

treaty of Versailles. Few authentic works by Hubert are known. There were some in Berlin and one each in Paris, Madrid, and Copenhagen.

Both painters rank among the greatest of the Flemish school. Their drawing and finish were meticulously exact, their colouring is almost as fresh and brilliant as it was 500 years ago, and they so improved the method of oil painting that they made it virtually a new medium. They were not, however, as sometimes alleged, its discoverers. A 10th century MS. by the monk Eraclius (*De Coloribus et Artibus Romanorum*) states that a method of grinding colours with oil was then "in the air," and Rogierus, a monk of the

12th century, recommended that colours should be ground with oil and mixed. The nature of the improvement introduced by the van Eycks seems to have been regarded as a craft secret, but it was conjectured that it was some essential oil which yielded a clear, transparent, liquid vehicle, which retained its limpidity, dried without darkening, and, when mixed with colours, gave results so superior as to supersede the viscous varnishes formerly in vogue. Consult H. and J. van Eyck, *Their Life and Work*, W. H. J. Weale, 1908. *Prom. Ike.*

**Eyck, JAN VAN** (c. 1385-1440). Flemish painter, brother of Hubert. Born at Maeseyck, he appears to have resided in The Hague during 1422-24, at Bruges for a few months in 1425, in which year he went to Lille, where he remained for four years, and later visited various foreign countries in an official capacity as painter to fulfil state commissions. He died at Bruges July 9, 1440. He is represented at his best in the National Gallery, London, by the magnificent picture of Jan Arnolfini and his Wife, and at the Louvre by the exquisite Chancellor Rollin Kneeling before the Virgin. Margaret (c. 1377-1430), his sister, was also an excellent painter.

Jan van Eyck,  
Flemish painter

are called ommatidia. Each has its own lens system, and a crystalline rod which seems to concentrate light on a sensitive cell. The ommatidia are optically isolated from each other by pigment. In many kinds of arthropods there are also simpler eyes, apparently derived from the in-pushings still found in their cousins the worms.

In molluscs the eyes are also fundamentally in-pushings, and in the most highly evolved forms, such as the cuttle fish, these eyes may be very complicated and are, it would seem, very effective.

All these eyes are always connected to the nervous system by nerve fibres. Light is nearly always concentrated on the faces of the sensitive cells of the in-turned skin which transmit, by these nerve fibres, the changes resulting in them from being subjected to light.

In the vertebrates, however, the eyes are essentially a part of the central nervous system itself which has been brought near to the surface, and to which have been added other elements co-operating in the formation of a functional whole. Their development through the whole of the vertebrate series is very similar. The central nervous system of the vertebrate, such as man, is a hollow tube made of ectoderm (*q.v.*), of which the bore varies at different points along its length. Near the front end, in the embryo, there is a considerable enlargement called the 3rd ventricle, and on each side, from the bottoms of the walls of this chamber, there is pushed out, by growth, a hollow diverticulum whose inside is continuously in communication with the space of the 3rd ventricle. This outgrowth is called the optic stalk. It is simply a part of the wall and floor of the brain which has grown fast and therefore got pushed out. As it grows, the advancing front end, that is the end farthest from the brain, enlarges. This, again, is by growth—the front end grows faster than the rest of the optic stalk, and the

## EYE: THE ORGAN OF VISION

Paul G. 'Espinasse, Prof. of Zoology, University Coll., Hull,  
and D. Stenhouse Stewart, M.R.C.S., D.O.M.S.

*An explanation of how the eye, particularly in human beings, develops with the development of the embryo, and of how it perceives light and images. See also: Light; Optics; Vision, etc.; and for disabilities and diseases such headings as Astigmatism; Blindness; Conjunctivitis; Glaucoma; Myopia; Orthoptics; Sight; Spectacles, etc.*

Protoplasm, the material of which living things are made, is commonly affected by light in ways which show themselves in a change in the behaviour of the living thing. In the more advanced forms, this capacity to react to light, while by no means restricted to any area, is much greater in one kind of organ—the eye—than it is over the rest of the body.

In the invertebrates there are eyes of many different kinds. They are always developed from the outer skin which may fold in and become transparent over the fold. In the arthropods, and in

particular in the insects, a most elaborate eye has evolved, having a considerable degree of efficiency. In it the optical elements are separate, so that the animal receives, apparently, a picture reminiscent of a photograph reproduced by printing from a half-tone block. It must consist of dots of light or shade, according to whether that part of the image falling upon any particular isolated optical element in the eye is light or dark. This is quite unlike any other eye, and must presumably have been evolved quite independently. The optical elements

dorsal part of this front end grows even faster than the ventral. This enlarged end is called the optic vesicle. The optic stalk starts by being roughly circular in section. This does not last: it becomes indented by a longitudinal groove which folds in along its ventral surface. The front of the optic vesicle gets pushed in by a forward extension of this groove. When the front has been pushed in the structure is called the optic cup, and it looks, from its front, like a cup with one crack in it, the embryonic fissure, or choroid fissure. This optic cup has a double wall. The space between the outer and inner walls is still in communication with the cavity of the 3rd ventricle.

At this stage of the development of the embryo the whole of the central nervous system is receiving upon its surface a condensation of loose mesodermal tissue. This condensation, or skin, is called the pia mater, and that part of it which condenses on the developing eye is called the choroid layer. From the first this choroid layer is applied to the whole of the surface of the structure under consideration; this includes the inner surface of the optic cup, simply because this was formed by the pushing in of the optic vesicle. In all this choroid layer blood vessels develop, as, indeed, they do in the rest of the pia mater. From these vessels is provided the vascular system of the eye, in both outer and inner layers.

Many of the cells forming the inner of these two layers of the optic cup (destined to form the light-sensitive retina in the adult) proliferate, and some grow tails which run back to the floor of the 3rd ventricle, these tails all growing towards the top of the embryonic or choroid fissure and then burrowing their way back to the brain in the material making up the roof of the groove in the optic stalk. When these tails reach the brain they make contact with other cells which have stayed in the brain. Together, these tails make up the adult optic nerve. They are very numerous indeed.

and a transverse section of them all together makes an immensely larger picture than a transverse section of the original optic stalk, in the floor of which they really begin to run.

The blood vessels in that part of the pia mater or choroid layer which is applied to the inner, or retinal, layer grow in an organized way so that they become oriented as elements radiating also from the top of the embryonic, or choroid, fissure. They are supplied and drained by larger vessels running in the pia mater along the groove. The inner aspect of the optic cup will now show vessels and nerve fibres all running to and from the top of the fissure. The lower part of this fissure closes, by the apposition of its sides, leaving a hole at its top. This hole is

transparent fibres grow backwards and forwards within the capsule, enveloping and compressing the central core or nucleus, the transparency of which may diminish in advanced age. The transparent fibres may also lose their transparency, so that vision may be impaired to a greater or less extent. Any such condition is known as cataract, and, if so opaque as to warrant it, the lens can be removed from within the capsule, and the optical properties of the whole system restored by special spectacles. A second, lesser, operation is sometimes necessary to ensure a clear opening in the capsule that remains. Alternatively, the whole lens can be removed, capsule and all. This is a difficult operation; but if it is successful the cure is complete.

After the lens has been contributed to the developing eye, a space appears in the mesoderm between the lens and the now completely healed skin. This space becomes the aqueous chamber of the eye. It is wholly lined with mesoderm, and becomes filled with fluid, called the aqueous humour.

Everything so far described as entering into the formation of the eye is now involved in a second condensation of mesoderm which, like the first, envelops the whole central nervous system. This second condensation is called the dura mater, and it forms a tough membrane. The white and rather opaque part which envelops most of the growing eye is called the sclerotic; the part overlying the aqueous chamber is transparent and is called the cornea.

The skin once more produces over the developing eye an in-pushing. This remains outside the developing sclera, and is therefore never a part of the true eye at all. It spreads, and separates the lids from the eyeball. This cavity is lined with conjunctiva, a layer of skin (ectoderm with

Eye. Sectional diagram of the human eyeball, seen from above, showing the positions of the various structures which receive and transmit visual impressions

filled up by all the vessels and nerves which have therefore to run through it. It is the one part of the inner aspect of the back of the eye which does not have light-sensitive elements in it. It remains blind, and is called the blind spot, or optic disk, and from it radiate in the adult eye all the arteries and on it converge the veins and nerve fibres which enter into the structure of the complicated adult retina.

During the processes described the growing optic cup has been closely approaching the outside skin of the embryo. The sink immediately overlying the optic cup develops a small hollow in-pushing. This in-pushing heals, and closes off a hollow spherical bubble of ectoderm which is contributed to the eye. Its hollow is filled by growth of the cells of the back wall, and it forms the transparent lens of the eye surrounded by a capsule of mesoderm. From the front cells

Eye. Diagram of the retina showing position of optic disk

underlying mesoderm with blood vessels) which is translucent and which thins out to overlie the transparent cornea.

The lens, caught between the front of the optic cup and the back of the aqueous chamber, gets attached to the front of the optic cup by a complicated system of fibres and muscles called the zonule and ciliary body. By the outward pull of these on its equator the lens, which has so far been roughly spherical in form, is made flatter. Vitreous humour fills the chamber behind the lens. If the lens of the human eye at rest is correctly flattened, an image of any distant object in the field of vision is focused accurately on the retina by the compound optical system set up by the cornea, the aqueous humour, the lens, and this vitreous humour. This whole system is kept in shape by the slight pressure of its contents. If this pressure should rise seriously, a condition known as glaucoma (*q.v.*) results. When anything near is looked at, the muscles of the ciliary body contract, allowing the young elastic lens to bulge, and to move a little forward so that the near object can be focused. This elasticity is lost with advancing years. If the eye grows too flattened the image will be focused in front of the retina, and the person with such an eye will be short-sighted.

After the lens of the embryo is in position, the rim of the optic cup, two layers thick, grows over the front of it, forming, with its mesodermal covering, the iris.

Eye. Behind the cornea, the transparent coat of the front of the eye, are the coloured, contractable iris and the pupil, through which light passes

This growth presently stops, leaving a round hole, the pupil, which can be contracted or dilated by muscular action. Thus is controlled the amount of light which enters the eye. The pupil is large in dull light and small in bright.

Except in albinos, who cannot make melanic pigment at all, the outer layer of the optic cup becomes heavily pigmented, to ensure that light enters the eye only through the pupil. In brown- or black-eyed people there is pigmentation in the front mesodermal layer of the iris. In blue-eyed people there is little or no pigment in the front layer of the iris, but the back layer is pigmented as usual.

#### Action of Light

The light-proof back of the eye is made up of the outer layer of the optic cup, black with melanic pigment, the sclera, and that part of the original pia mater or choroid trapped between them. The inner layer of the optic cup forms the highly complex retina, and the whole of the rest of the eye is an arrangement to bring light properly focused on to this retina, for it is here that the light is used. The pigmented epithelium is the inside of the outer layer, and the receptor layer is the outside of the inner layer. Between them is the obliterated cavity of the original optic stalk which was in communication with the 3rd ventricle of the brain. In a pathological condition the retina sometimes gets detached from the pigment layer. This is really the reopening of the old cavity.

The light-sensitive elements are of two kinds: rods, very sensitive to light, but probably not sensitive to differences in colour; and cones, which are rather less sensitive to light, but are probably sensitive to differences in colour. It is a remarkable fact that light has to go through all the vessels and connective tissue and nerve fibres shown there before it gets to the actual light-sensitive elements. This is quite unlike the condition in nearly all invertebrates, where the light falls on the *faces* of the sensitive cells.

The exact way in which the light brings about a change in the sensitive cells is not quite clear. It can be said, however, that a substance called visual purple (in no way to be confused with the melanic black backing pigment of the outer layer, from which it is wholly distinct in every way) is bleached by light. This substance is present in and among the sensitive cells, and there is some evidence that it mediates the chemical change which starts the propagation of a wave of change along the nerve fibres to the brain. When these impulses reach the brain they are sorted out and

perceived by a mechanism of which we know very little.

Rods and cones are not distributed equally all over the surface of the retina. At the blind spot there are neither. At a point near the middle of the back of the eye there are far more cones than rods. It is on this point that the image of the eye of a needle is focused when it is threaded, or of a colour when it is matched. Round the edge of the retina there are only rods, and it is here that faint stars are seen most easily. When trying to pick out a faint light at night it is best not to look straight at it. This keeps the image off the cones in the middle of the eye and on the rods. For the same reason, an electric light which is really flickering on alternating or interrupted current can often be seen to be doing so when its image is at the edge of the retina.

#### Appreciation of Colour

The details of the perception of colour are not understood. It is remarkable that part of the mechanism which seems to mediate it is present in animals which are certainly colour-blind. The eyes of most, if not all, mammals seem to contain cones which are thought to respond differently to different wavelengths of light, but for these differences to be perceived seems to require a further elaboration not of the eye but of the brain, which is present only in man and a very few other mammals and birds. Some insects certainly distinguish colours, but how they do it is not known.

In the vertebrates as a whole, there is a connexion between the optic nerves leading from the two eyes before they actually reach the brain. Rather more than half the fibres from the right eye reach the left side of the brain. The meeting of the two nerves gives a very obvious X-shaped structure called the optic chiasma, underneath the brain. In some way this arrangement permits the fusion of the two fields of vision of the two eyes into one percept.

The eyes lie in two cavities or sockets in the skull, known as orbits. This arrangement protects the eyes, for the bony margins of the orbits resist blows which would otherwise damage the eyeball. The eyelids and lashes also protect the eyes, and the lachrymal gland, which secretes tears and is situated at the outer side of the eye, is another protective device. The eyes are moved by six muscles each. A disturbance of the balance of these muscles in an adult

may cause headache or even double vision; in a child it causes a squint requiring immediate attention. If other means fail, the squint can often be corrected by surgery. *Consult* The Invertebrata, L. A. Borradaile, L. E. S. Eastham, F. A. Potts, and J. T. Saunders, 1932; General Zoology of the Invertebrates, G. S. Carter, 1940; The Vertebrate Eye, G. L. Walls, 1942.

**Eye.** Small hole, or loop, in certain articles, usually in a seam through which a cord or tape can be threaded to close the article. Eyebolts are screw bolts with a ring in them. The eyes of a sail are holes which take the lashings when reefing. A Flemish eye is the end of a rope bent to form a loop.

**Eye.** Mun. bor. and market town of Suffolk, England. It stands on an affluent of the river Waveney, 19 m. N. of Ipswich, on the railway. An ancient town, it has castle ruins, a grammar school founded in 1566, a town hall, and corn exchange. Brewing is an industry. Market day, Mon. It gives its name to a co. div. returning one M.P. Pop. 1,733.

**Eyebar.** Metal bar with one or both ends enlarged. In the enlarged end a hole is drilled so that by means of a pin or bolt the end of the bar may be secured to another object. Eyebars vary in size, from a fraction of an inch in diameter up to the great eyebars used in the Quebec bridge, each sustaining a pull of 300 tons.

**Eyebolt.** A bolt with one end formed like an eye or rigid ring instead of an ordinary head. Eyebolts are used for many purposes, e.g. as door fastenings and attachments for stays and guys.

**Eyebright** (*Euphrasia officinalis*). Small annual herb of the family Scrophulariaceae. A native of N. Europe, N. and W. Asia, and N. America, it is a parasite upon the roots of grasses, sedges, etc. The leaves are oval or lance-shaped, with cut edges, the flowers small, white, veined with purple, and the middle lobe of the lip yellow. It grows in meadows and on heaths.

**Eyemouth.** Burgh of Berwickshire, Scotland. It stands at the mouth of the little river Eye, 8 m. N.W. of Berwick, and has a railway station. Eyemouth is a fishing centre, for

which industry there is a good harbour, protected on the N. by St. Abb's Head. The town hall is the chief public building. Pop. 2,321.

**Eye-piece.** Lens of a telescope nearest to the eye. In a telescope light falls in nearly parallel rays on the object lens, which throws an image of the field of vision. The eye-piece magnifies this image. Eye-pieces used with astronomical telescopes vary in form. The first telescope made by Galileo had a bi-concave eye-piece such as opera glasses now have. This eye-piece is placed between the object glass and the focus at which the image is thrown. Convex eye-pieces are placed outside the focus. But both kinds colour the light coming from the image owing to

Eye-piece. Diagram showing principle of working. E, eye; A, eye-piece; F, focus; B, object lens

the refraction of the rays. Huygens discovered that this defect might be remedied in the eye-piece by employing two plano-convex lenses, both with the flat sides towards the eye, the larger placed nearer the image, and the smaller nearer the eye. This construction is in general use, except for micrometer eye-pieces, which have spider-webs for measuring the sizes of the different objects. In these eye-pieces the flat sides are turned away from each other. *See* Telescope.

**Eylau** or PRÜSSISCH-EYLAU. Town of the Kaliningrad electoral district of the R.S.F.S.R., northern part of former E. Prussia. It stands on the Pasmar. 24 m. S. of Kaliningrad (Königsberg), and is noted for the battle fought here, Feb. 8, 1807, between the French under Napoleon, and the combined Russians and Prussians.

After his defeat at Pultusk, Dec. 26, 1806, Bannigsen, pursued by Napoleon, decided to make a stand at Eylau. In an engagement on Feb. 7, 1807, Bagration and Barclay de Tolly, after several assaults by the French, were forced to abandon the village. In a snowstorm on the morning of the 8th the battle

developed. The emperor could bring into the field only Augereau's and Soult's corps, together with six divisions of Murat's cavalry; his other troops were hurrying up over snow-bound roads. An advance by the French from Eylau was beaten back and the Russians attacked in force against Eylau windmill. Augereau's 7th corps was thereupon ordered by Napoleon to stem the Russian advance. The day was going against the French, and the battle reached a crisis when Augereau's troops, blinded with driving sleet and snow, enveloped by artillery and attacked by infantry, suddenly had a mass of cavalry launched against them. Augereau was hit, and all his colonels and brigadiers were killed or wounded.

The French broke, and were in full flight when Napoleon hurled 18,000 of Murat's cavalry upon the Russians. The effect was decisive. The Russians were scattered, regiments were ridden down in the blinding snow, the squares were broken, 16 standards were taken, and the victorious French stopped only on encountering Bannigsen's reserves. As the afternoon wore on, with the arrival of Napoleon's reserves, the day was won, and Bannigsen retired on Königsberg, having lost 18,000 men and 24 guns. The French lost 15,000 men. Napoleon brought into action altogether 79,000 men; the Russians numbered 75,000. In the Second Great War, Prussisch-Eylau was captured by the Russians, Feb. 10, 1945. *Pron.* Ile-ow.

DEUTSCH-EYLAU lies 68 m. S.E. of Danzig, in the Masurian voivodship of Poland (S. part of former E. Prussia). In the Second Great War, it was captured by the Russians, Jan. 22, 1945.

**Eyot** (A.S. *igath*) or ART. Islet in river or lake, especially one overgrown with willows. *Pron.* eight.

**Eyra.** S. American wild cat. Resembling a large weasel with a long tail, it is reddish brown in colour, without stripes. It ranges from Mexico to Brazil, and is a trouble to the poultry farmer.

**Eyre.** Word derived from the Latin *iter*, a journey. It is used chiefly in connexion with the itinerant justices sent out by Henry II and known as justices in eyre. In Scotland the form *aire* came into use. *See* Henry II; Judge.

**Eyre.** Lake in S. Australia. It is 4,000 sq. m. in area, but in dry seasons merely a salt marsh. In wet seasons the Borcoo and Diamantine flow into it. E. J. Eyre (*v.i.*) discovered it in 1840.

Eyebright. Flowers and leaves of *Euphrasia officinalis*

**Eyre, EDWARD JOHN** (1815-1901). British colonial governor. Born at Hornsea, Yorks, Aug. 5, 1815, he emigrated to Australia in 1833, and carried out valuable explorations of unknown territory, especially of the coast between Adelaide and King George Sound, in 1841. He went to New Zealand as governor in 1846, to St. Vincent, 1854, and to Jamaica, 1861. His

Edward J. Eyre,  
British explorer

stern handling of the negro rising there in 1865 caused his recall to England, where his action roused wide controversy. In 1872 the government repaid the legal expenses which he had in self-defence incurred, and awarded him a pension, 1874. He died Nov. 30, 1901.

**Eyre, SIR JAMES** (1734-99). English lawyer. Born at Wells, he went from Winchester to S. John's College, Oxford, and became a barrister. He successfully defended John Wilkes in 1763, attacking general search warrants, by which means Wilkes's authorship of No. 45 of the North Briton had been proved. From his post as recorder of London he was promoted in 1772 to be a judge; in 1787 he became chief baron of the exchequer and in 1793 chief justice of the court of common pleas. He remained in office until his death, July 1, 1799.

**Eyre, SIR VINCENT** (1811-81). British soldier. The son of a soldier, he was born Jan. 22, 1811, and educated at Norwich grammar school. He joined the service of the E. India Co. in 1828 and, in the artillery, was with the force that entered Afghanistan in 1840; after the siege of Kabul by the Afghans he and his family were surrendered to them as hostages. In 1843 they were rescued by a relieving force. Eyre commanded the artillery at Gwalior, and during the Mutiny distinguished himself by his prompt action in marching against some rebels at Arrah and defeating them at Jagdespur. He held a command in the force that relieved Lucknow, and retired as a major-general in 1863. He died at Aix-les-Bains, Sept. 22, 1881.

**Eyston, GEORGE EDWARD THOMAS** (b. 1897). British racing motorist. Born June 28, 1897, he went to Stonyhurst and Trinity College, Cambridge. Equally interested in designing and driving cars, between 1931 and 1938 he captured some 250 records for speed

by distance or time. In 1936 with A. Denly he broke every record from 500 m. to 5,000 m. and from 3 hr. to 48 hrs.

He excelled Sir M. Campbell by driving his car Thunderbolt at 311.42 m.p.h., Nov. 19, 1937; and on Sept. 16, 1938, in Utah, attained 357.53 m.p.h. Eyston, who was awarded the Segrave trophy in 1935, edited *Fastest on Earth*, 1939. He was engaged in the Second Great War on naval constructional engineering. *Pron.* Easton.

G. E. T. Eyston,  
British racing  
motorist

**Ezekiel, BOOK OF.** One of the prophetic books of the O.T. Ezekiel was both priest and prophet. With King Jehoiachim and other members of the upper classes of Jerusalem he was deported to Babylonia in 597 B.C. by Nebuchadnezzar (605-562 B.C.). The exiles were settled at different points, Ezekiel becoming a member of the community at Tel-abib, near the river Chebar, which has been identified with the grand canal in the neighbourhood of Nippur. The prophet received his call in the fifth year of the reign of Jehoiachim (592 B.C.).

The book falls into five divisions: (a) the prophet's call and consecration, Ezek. 1, v. 1-3, v. 15; (b) discourses on the imminent destruction of Jerusalem, 3, v. 16-24, v. 27; (c) oracles against Ammon, Moab, Edom, Philistia, Tyre, Sidon, and Egypt, 25-32; (d) prophecies of the restoration of Israel and the overthrow of her foes, 33-39; (e) vision of a restored theocracy of a united Israel, 40-48. The book itself assigns definite dates to many of the prophecies, the latest mentioned being about 570 B.C. Once the prophet admits that a prediction had not been fulfilled, when Nebuchadnezzar was expected to capture Tyre.

The authorship and integrity of the book present no difficulty. The difficulties are associated with the Hebrew text, often obscure and corrupt. As the author was a priest it is not surprising to find that he lays more stress than the other great prophets on externalities, rites, and ceremonies. We find points of affinity with the priestly phraseology of the later legislation, which has been called the Code of Holiness (Lev. 17-26). But due emphasis is laid also upon personal responsibility and personal re-

ligion. "Pastor rather than prophet," Ezekiel's visions of the chariot and cherubim (1, v. 1-3, v. 15) had influence on the later symbolical literature. They have been interpreted (e.g., by the Rabbis) as a synopsis of theosophy. The vision of the valley of dry bones in chap. 37 has become famous. In chaps. 38 and 39 occur the curious creations Gog and Magog. Gog, perhaps suggested by Gyges, king of Lydia, is a prince from the land of Magog, who leads a great host of nations against the restored Israel, and is defeated ignominiously. In the later Jewish eschatology Gog and Magog are represented as leading in vain the final attack of the powers of the world upon the Kingdom of God.

**Ezra, BOOK OF.** Book of the O.T. Ezra was a Jewish scribe living in exile in Babylon, under Artaxerxes Longimanus. He is said to have belonged to the priestly line, and to have been a descendant of Seraiah, the high priest when Jerusalem was captured by Nebuchadnezzar. About 458 B.C. he was allowed to return to Jerusalem. There he found that the remaining Jews had intermarried with heathen women, and great laxity prevailed, and he set out to restore worship and order. He started the rebuilding of the Temple, and restored the text of the Jewish law.

The O.T. Book of Ezra is closely related to the Book of Nehemiah, so closely indeed that, as the Talmud and early Christian writers indicate, they form really one work. Closely related to them are the Books of Chronicles, of which Ezra and Nehemiah are a continuation. The threefold work, Chronicles-Ezra-Nehemiah, covers the history of Israel from the period of Adam to the second visit of Nehemiah to Jerusalem in 432 B.C.; but the history is viewed from an ecclesiastical and priestly standpoint.

Ezra-Nehemiah (which together appear in the Septuagint as 2 Esdras) includes the history from 538 B.C., when Cyrus issued a decree permitting Jewish exiles to return, to 432 B.C., when Nehemiah made his second visit to Jerusalem. The Ezra portion records the return of the exiles, the rebuilding of the temple, and the mission of Ezra, who was sent as royal commissioner from Babylonia to Jerusalem by Artaxerxes. Part of the book is written in Aramaic (4, 8-6, 18, and 7, 12-26). Ezra-Nehemiah seems to have been compiled between 300 and 250 B.C.

THE letter F has a more uncertain history than most of its fellows. It is not clearly recognizable in either the Egyptian hieroglyphs or the Semitic alphabets, though some scholars have postulated its evolution from the Semitic *van*, or *hook*. This was related to the ancient Egyptian hieroglyph . In its hieratic form (3000-2500 B.C.) this became , while the Semitic form was  and a Phoenician variant of the same letter (1000 B.C.) gives , which is not unlike an F with a broken back. However this may be, the letter as we know it is the classical Greek digamma, or double gamma, one being superimposed on another. Another form was . Its resemblance to the letter E therefore  appears to be accidental, stressed only by the juxtaposition of the two in the

Greek and Roman alphabets. Indeed the Greeks' pronunciation of their digamma corresponded to that of our modern *w*. Its labial quality was introduced in the early Latin alphabets, in which a combination of *f* and *h* represented our present pronunciation of *f*.

The *h* was later omitted, as the Latins came to accept the letter *V* as the usual sign for our *w* sound; and the classic Roman *F* therefore signified the sound of *f* as we understand it today. The development of the minuscule letter *f* needs no explanation if one recalls the simplification of inscribed letters into penstrokes; but it is worth noting that Latin cursive writing generally extended the letter below the line, a practice maintained by modern printers in the case of the italic *f*.

**F** Sixth letter of the English and Latin alphabets. It is a hard labial (lip-sound), the corresponding soft sound being *V*. Its ordinary sound is as in *fat*. In the single word *of*, and in its compounds, e.g. hereof, thereof, it is pronounced as *v*. In *halfpenny* both *f* and *l* are mute (hay-peny). A noun ending in *-f* often takes plural in *-ves*; *loaf*, *loaves*. Doubling *f* modifies the sound of the preceding vowel; *chaffing*, *chaffing*. The sound of *f* is also represented by *ph* in words derived from the Greek, as in *philosophy*, *phrase*. See Alphabet; Phonetics.

**F**. In music, the fourth note of the natural scale of *C*. *F* is only a semitone above *E*, instead of a whole tone. *F* sharp is the first sharp to appear in a key signature—key of *G*. See Key Signature.

**Faber**, FREDERICK WILLIAM (1814-63). British divine. Born at Calverley, Yorks, June 28, 1814, he

*F. W. Faber*

was educated at Balliol College, Oxford, and in 1843 became rector of Elton, Hunts. In 1845 he succeeded to the Roman Church and four years later became superior of the Oratory of S. Philip Neri, now at Brompton. A popular preacher, he is best known by his hymns, which include *Sweet Saviour, bless us ere we go*; *Hark, hark, my soul*; *Souls of men, why will ye scatter*? Died at Brompton, Sept. 26, 1863.

**Faber**, GEOFFREY CUST (b. 1889). British publisher and writer. Born Aug. 23, 1889, he was educated at Rugby and Christ Church, Oxford, and worked with the Oxford University Press, 1913-14. After the First Great War he became a barrister, and from 1924 chairman of the publishing firm

which bears his name. His first book, *Interflow*, appeared in 1915. Of his later works *Oxford Apostles*, 1933; *A Publisher Speaking*, 1934; and *The Buried Stream*, 1941, were probably best known.

**Fabia**. One of the oldest Roman *gentes* or clans, probably of Sabine origin. They appear to have been originally priests, who took part in the supervision of the festival *Lupercalia* (*q.v.*). They were a patrician clan, whose chief families were those of *Ambustus*, *Labeo*, *Maximus*, and *Pictor*.

**Fabian Society**. The oldest British Socialist organization. Founded in 1884, it was named after the Roman general *Fabius Maximus* (*v.i.*) whose tactics were expressed thus: "For the right moment you must wait . . . but when the time comes you must strike hard." It numbers over 5,000 members and has 100 local societies. Since the days when *Sidney* and *Beatrice Webb* and *Bernard Shaw* were leading members, the society has always exerted political influence, and it was one of the founder organizations of the Labour party, with which it is officially connected. It seeks to encourage Socialists in a high standard of free and independent research. Colonial and international bureaux have been set up in recent years. The offices are at 11, Dartmouth Street, Westminster, S.W.1.

**Fabius Maximus**, *QUINTUS* (d. 203 B.C.). Roman general. He was appointed, with dictatorial powers, to the command of the Roman forces after the defeat by the Carthaginians at *Lake Trasimenus*, 217 B.C. By a series of delaying tactics—whence his surname of *Cunctator* (the delayer)—*Fabius* avoided pitched battles with *Hannibal*, wore down the offensive power of the Carthaginians, and gave the Romans time to consolidate their forces. He thus paved the way for *Scipio's* vic-

tories, which ended the Second Punic War. *Fabian* tactics has come to be used proverbially for a waiting policy.

**Fabius Pictor**, *GAIUS*. Painter of a battle scene, the first recorded Roman painting, on the walls of the temple of *Salus* (Safety) in ancient Rome (c. 302 B.C.). In the reign of *Claudius* both temple and picture were destroyed by fire.

**Fabius Pictor**, *QUINTUS* (c. 225 B.C.). Earliest Roman historian. His writings, which were in Greek, are lost, with the exception of some fragments, but he was one of the authorities used by *Livy*, *Diodorus Siculus*, and *Polybius*. A Latin version was also in existence, whether by himself or a later writer is doubtful.

**Fable** (Lat. *fabula*, story, narrative). Short allegorical story in which generally animals, trees, etc., are endowed with speech and human qualities, and by their words and deeds are made to convey moral lessons. Its invention is frequently ascribed to *Aesop* (*q.v.*), but many fables associated with his name probably originated at a much earlier date in India, where they are known sometimes as the fables of *Bidpai* or *Pilpay*, a traditional ancient Indian philosopher, and sometimes as the work of *Buddha*. Some of the fables traditionally ascribed to *Aesop* are but variants of those found on ancient Egyptian papyri. Many, too, have been traced to the Arabs, by whom they may have been brought from India.

It is probable that tales of a fabulist character are common to most primitive peoples, mark, indeed, a definite stage in race-culture; the addition of a "moral" to any beast tale being a natural development, and not peculiar to one originating writer or people. Of later fabulists the French poet *La Fontaine* is perhaps the most celebrated.

**Fabliaux.** Short tales in verse, almost always octosyllabic couplets, dealing from the comic point of view with incidents of ordinary life. The fabliaux appeared in France in the 12th century, and remained popular for about 200 years. The tales are licentious both in subject and in treatment, frequently satirising priests or women or both in language that is generally coarse, but many of them have real humour and the best are free from objection. The fabliaux were first collected and published by Barbazan in the 18th century, and were re-collected and issued in six volumes by Anatole de Montaiglon and Gaston Raynaud in 1872-90.

**Fabre, FERDINAND** (1827-98). French novelist. Born at Bédarieux, Hérault, Feb. 9, 1827, he studied for the priesthood, medicine, and the law in turn before producing his first novel, *Les Courbezon*, 1862. He died in Paris, Feb. 11, 1898. A moderate realist, he depicted with minute fidelity the people and manners of the Cévennes, as in *Le Chevrier*, and excelled particularly in studies of clerical life, as in *L'Abbé Tigrane*, 1873, and *Mon Oncle Célestin*, 1881.

**Fabre, JEAN HENRI** (1823-1915). A French entomologist. Born at St. Léons, Aveyron, Dec.

21, 1823, he passed early years in great poverty. At 18 he was in charge of a primary school, where he improved his knowledge of mathematics and physics in

Jean H. Fabre, French entomologist

his spare time, and where he bought his first book on entomology. Becoming professor of philosophy in the college of Ajaccio and in 1862 at the lycée at Avignon, he turned his attention to the study of insects. His earliest observations appeared in the *Annales des Sciences Naturelles*, 1855-58, subsequently enlarged in *Souvenirs Entomologiques*, 10 vols., 2nd ed. 1914, etc. He died Oct. 11, 1915.

Fabre's earlier volumes are remarkable for their close and painstaking observations on living insects, bringing to light many unsuspected habits and instincts of wasps and bees in particular. His work, though gaining the praise of Darwin, failed to win popular attention. But the reputation of the insect's Homer, as Fabre has

been called, has steadily increased. A curious blend of Gilbert White and Darwin, he not only displays amazing powers of minute and careful observation, but his writings have an unusually high literary quality. *Consult Works*, complete Eng. trans. A. Teixeira de Mattos, 1912, etc.

**Fabre d'Eglantine, PHILIPPE FRANÇOIS NAZAIRE** (1750-94). A French revolutionary and dramatist. Born at Carcassonne, July 28, 1750, he became a member of the National Convention and for a time was secretary to Danton. He had been an actor, and his play *Philinte* attracted some attention in 1790, but perhaps his most successful literary achievement was the renaming of the months for the revolutionary calendar, 1793. He was guillotined with Danton and his friends on a false charge of forgery, April 5, 1794.

**Fabriano.** City of Italy, in the prov. of Ancona. It stands on the E. slopes of the Apennines, at an alt. of over 1,000 ft., 45 m. by rly. S.W. of Ancona, and is the rly. junction for Urbino. It has a cathedral and town hall, and some of the churches contain pictures of the Fabriano school. The city is celebrated for its paper mills, established in the 13th century. Gunpowder, glue, parchment, and felt are also made, and there is trade in cattle and cereals. The hospital of Jesus and bishop's palace were damaged in the Second Great War.

**Fabric** (Lat. *fabrica*, workshop). Term originally applied to a cloth made by weaving or felting, but now more generally used for the manufacture or texture of anything. In aeronautics, fabric is the linen, treated with "dope" or other preservative, often used for the outer covering of aircraft fuselage and wings. The word is also applied to the outer body of a building, e.g. a church, or figuratively to any system of united parts, e.g. a national constitution, human society, or a religious denomination.

**Fabricius, GERONIMO** (1537-1619). Italian anatomist. Known as Fabricius ab Acquapendente, he succeeded Fallopius in 1562 as professor of surgery and anatomy at Padua, where his great knowledge of comparative anatomy enabled him to introduce improvements into applied surgery. His *Opera Chirurgica*, 1617, was widely read. One of the founders of embryology and an excellent anatomist, he discovered the valves in the veins, and so led William Harvey, who studied under him, to

consider the circulation of the blood. Fabricius died May 21, 1619.

**Fabricius, JOHANN ALBERT** (1668-1736). A German classical scholar. Born at Leipzig, Nov. 11, 1668, at the age of 25 he removed to Hamburg, where shortly after publishing his *Bibliotheca Latina*, 1697, he became a professor at the gymnasium. His later works on classical bibliography, storehouses of learning and still indispensable, included *Bibliotheca Graeca*, 1705-28; *Bibliotheca Ecclesiastica*, 1718; and *Bibliotheca Latina Mediae et Infimae Aetatis*, 1734. He died at Hamburg, April 30, 1736. *Pron.* Fab-reets-ious.

**Fabricius Luscinius, GARUS** (fl. 280 B.C.). Roman general. He won notable victories over the Lucanians, Bruttians, and Samnites, and in the war with Pyrrhus twice conducted negotiations with that monarch. After the Roman defeat at Heraclea in 280 B.C. Pyrrhus tried hard to buy Fabricius over, but the stern Roman was incorruptible. Later, after Fabricius had delivered up a traitor who had offered to poison Pyrrhus, negotiations were resumed, with the result that in 278 satisfactory terms of peace were arranged. During his censorship in 275 he made great efforts to check the growing tendency to luxury and extravagance. He himself died so poor that his daughters had to be provided with dowries by the state. Fabricius was lauded by subsequent generations as the embodiment of the old republican virtues. *Pron.* Fab-rish-ius.

**Fabritius, CAREL** (c. 1624-54). Dutch painter. A pupil of Rembrandt, he lived in Delft. Little is known of his life, and his pictures were few. His *Portrait of a Man*, in the Rotterdam museum, was for long attributed to Rembrandt. His most famous work, *The Goldfinch*, was in the Mauritshuis at The Hague, though *The Family Group*, destroyed by fire, was accounted his masterpiece. There were several portraits by him in German galleries, and one of a soldier in the National Gallery, London. His most famous pupil was Vermeer (q.v.) on whom his influence is apparent. Fabritius perished in a powder magazine explosion at Delft, Oct. 12, 1654.

**Fabrizi, NICOLA** (1804-85). An Italian patriot. Born at Modena, April 4, 1804, he was implicated in the Carbonari insurrection of 1831. He fled to Marseilles and thence to Spain, where he fought against the Carlists, 1837. One of Mazzini's

most trusted agents, he moved to Malta, whence he assisted the Sicilian insurrection of 1848. When revolution broke out in Italy, he fought at Venice and Rome, retiring to Malta after the fall of Rome. He raised a revolt in Sicily in 1860 and joined forces at Palermo with Garibaldi, who made him governor of Messina and war minister. He opposed Garibaldi's Rome campaign of 1862, but in 1867 fought at Mentana. He died March 31, 1885. *Pron.* Fab-reet-si.

**Fabroni**, ANGELO (1732-1803). Italian biographer, called "the Plutarch of modern Italy." Born at Marradi, Tuscany, Sept. 25, 1732, he became prior of San Lorenzo, Florence, in 1767, and was appointed tutor to the sons of Leopold, grand duke of Tuscany, in 1773. His chief work was *Vitae Italarum Doctrina Excellentium qui Saeculis XVII et XVIII floruerunt*, in 20 vols., 1778-1805, vol. 19 containing his autobiography. He also wrote biographies of Lorenzo de' Medici, 1784; Cosimo de' Medici, 1788-89; and Petrarch, 1799. He died Sept. 22, 1803.

**Façade** (Fr.). Architectural front of any building or part of a building. Not necessarily confined to the principal front, the term is mostly used in connexion with street architecture, where one face of the building is mainly important. A façade is, strictly, a front in one plane. Thus a front with one or more pavilions projecting from its surface could not be referred to as a single façade, each pavilion having its own façade. *See* Architecture.

**Face.** The front of the head. The face may be divided into the regions of the forehead, temples, ears, eyes, nose, mouth, cheeks, and upper and lower jaws. The bones of the face are fourteen in number, twelve being in pairs, namely the superior maxillary, malar, nasal, palate, lachrymal, and inferior turbinated bones. The palate bone is situated deeply in the region of the mouth and nose. The mandible or lower jaw and the vomer, part of the septum dividing the nose into two parts, are single bones.

Besides these bones, some of the bones assigned by anatomists to the cranium also take part in the formation of the face, namely the frontal, parietal, sphenoid, and temporal bones. The forehead is formed by the frontal bone. Underlying the scalp is the frontalis muscle, contraction of which causes the furrows which appear on the forehead when the brows are lifted to express surprise. Running up

on each side of the forehead is the temporal artery which is often prominent and well marked, owing to thickening of the walls of the vessel, an indication of senility of the vessels. The superciliary ridges are bony prominences above the eyes, best seen in adult males. These ridges were strongly developed in certain prehistoric forms of man, particularly Neanderthal man. Vertical furrows seen in the act of frowning are produced by a small muscle, the *corrugator supercilii*.

The eyeball is situated in a bony framework known as the orbit, which, together with the projection of the nose, serves to pro-

Face. Diagram showing the muscles of expression in the human face

tect it from injury. The aperture between the eyelids is known as the palpebral fissure. The nose is divided into two parts by a septum formed partly of bone and partly of cartilage, the junction of the two being marked by the bridge of the nose. The outer angle of the orbit is prolonged towards the ear into a bridge of bone known as the zygoma. The temporal muscle occupies a fossa forming the greater part of the temporal region, its tendon passing beneath the zygoma to be attached to the lower jaw. This muscle takes part in the act of mastication, and can be felt contracting when the mouth is firmly closed. The anatomical features of the ear, nose, and mouth are described under their respective headings.

The principal nerves of the face are the fifth or trigeminal nerve, which is the main sensory supply to the face, and the seventh or facial nerve, which supplies most of the muscles of the face. The

face is well supplied with blood-vessels, which explains the profuseness of haemorrhage following injury to the tissues.

**Face Conveyor.** Machine used for the transport of coal. The transport of coal from the point where it is cut out of the working face comprises three stages—from the face to the main haulage way; the main haulage to the foot of the shaft; the raising of the coal to the surface. The first stage is relatively costly, and often difficult on account of the limited space available, and particularly the low roof. Face conveyors have been introduced to perform it.

The jiggng conveyor consists of a long steel trough suspended on short arms in such a way that the trough can be "jiggled" to and fro. Coal is shovelled on to the trough, and at each stroke or movement is thrown or jerked bodily forward a short distance until finally thrown off the end of the conveyor. The chain conveyor consists of a fixed trough or bed along which a chain is drawn. The chain is composed of bars of steel, forming links and cross-pieces all of which have their faces vertical. The coal is thrown on to the chain, the large pieces being carried along on the tops of the links and cross-pieces, while the small drop through the chain to the bottom of the trough, and are scraped forward by the under edges of the chain. These machines can be moved forward as the working face is extended. Driven either by compressed air or electrically, one can remove 360 tons from a face of 100 yards in eight hours. *See* Conveyor.

**Face Value.** Nominal value of debentures, stocks, shares, and securities generally, as opposed to their real or market value. For instance, the face value of Consols is in £100 and multiples of £100, and of an ordinary share in the Amalgamated Press 10s., although in each case the selling value is very different.

**Fâcheux**, LES (The Bores). Three-act or comedy-ballet masque by Molière. Written and played within a fortnight, it was first produced in the garden of Fouquet's residence, Vaux-le-Vicomte, Aug. 17, 1661. It displays ten bores, satirical portraits from society, who prevent an ardent young lover from speaking with the object of his devotion. It was the first play written by Molière for Louis XIV, and the first play of its kind to be produced on the French stage.

**Facial Angle.** A method of measuring the facial profile, especially in man and the anthropoid apes. The earliest, Pieter Camper's (c. 1770), was subtended by two lines (1) drawn from the glabella to the upper jaw, (2) drawn in a plane passing through the

Facial Angle. Diagram showing a method of measuring the facial profile

base of the nose and the centre of the aural orifice. This measures 40° (orang-utan), 70° (negro), 80° (European). Camper's angle is now superseded.

**Facial Nerve.** Seventh cranial nerve. It supplies most of the muscles of the face, and the sense of taste in the anterior part of the tongue. Paralysis of the facial nerve (Bell's Palsy) is most often due to inflammation of the fibrous tissue surrounding the nerve where it leaves a narrow canal bone, the nerve thus strangulating itself. It is most commonly caused by exposure to cold. At sudden onset the face is drawn over to the opposite side, while on the affected side the eye cannot be closed, the lower lip drops, and the forehead cannot be wrinkled. Within a time limit of 2 days to 2 years the recovery from paralysis begins, and recovery is usually complete. Salicylates and iodides are useful drugs, while galvanic stimulation helps the tone of the inactivated muscles. Eventually the surgeon may have to relieve the nerve of the constricting pressure.

**Facility** (Lat. *facilis*, easy). Ability to perform anything easily. In Scots law it has a special meaning: a condition of mental weakness that falls short of idiocy. The person suffering from this condition is one easily persuaded.

**Factor** (Lat. *maker*). In mathematics, any of two or more numbers or expressions which when multiplied together produce a given number or expression. Thus 7, 3, 2 are factors of 42 and  $(a+b)$ ,  $(a-b)$  of  $a^2-b^2$ . A factor which can be divided only by itself and unity is called a prime factor. The

factor of the greatest degree which is common to two algebraic expressions is called the highest common factor. In arithmetic the highest number which is a factor of two or more numbers is called the greatest common divisor. See Mathematics.

**Factor** (Lat. *facere*, to make). Word meaning an agent, but in a special sense an agent who buys and sells for a principal. He carries on business in his own name, but differs from a broker in that he usually handles the goods in which he deals and transfers them to his principal: moreover, he has a greater latitude about buying and selling. In English law several statutes have regulated the relations between a factor and his employer, these having been consolidated by the Factors Act of 1889. Much, however, is left to custom, and this differs obviously very much between one trade and another. The main provision of the Act gives a valid title to a person who in good faith buys from a factor goods which are in the factor's possession with the consent of his principal.

Factor in Scotland is a man who manages an estate, a land agent. A judicial factor is one appointed by a court of law to manage the estate of a minor or imbecile.

**Factor of Safety.** Ratio of the ultimate strength of a structure, or part of a structure, to the normal load which it carries under the conditions for which it was designed. Where accident may involve injury to human beings, a high factor of safety is usually prescribed by law. The wire rope used for winding men in pit cages must have a factor of safety of from 8 to 10, i.e. the rope must be strong enough to carry 8 to 10 times the normal load.

**Factory.** Building or assembly of buildings devoted to the manufacture of goods. Factories are defined by the Factories Act, 1937, as any premises in which persons are employed in manual labour in any process for or incidental to (a) the making of any article or part of an article; (b) the altering, repairing, ornamenting, finishing, cleaning, washing, or breaking up or demolition of any article; or (c) the adapting for sale of any article. This definition abolishes the old distinction between textile factories, non-textile factories, and workshops. This Act (*v.i.*) is a complete code covering the safety, health, and welfare of all persons employed in factories as well as regulating the hours of employment of women and young persons.

In planning a factory the builder's first consideration is the site. In heavy industries proximity to raw materials may govern the choice, though this factor may be overborne by convenience of transport or access to markets. Coal being a prime necessity for most industries, the coalfield areas have in the past attracted a large proportion of works, but with the adoption of electric power this is not now such a great matter. The wide use of this power and the value of being near the chief market have caused a movement of British lighter industries into the neighbourhood of London. For chemical works, where salt, lime, or other deposits are prime necessities, it is cheaper to erect the buildings over these deposits even at the cost of transporting the coal.

The usual modern factory consists of a group of light, well ventilated, single-storey buildings, so constructed that they can be readily expanded or adapted. For some processes, e.g. flour milling, a multi-storeyed building may be the most economical. Proximity to railways, roads, and waterways is an obvious requirement. Other needs are firm foundations away from marshy ground or underground workings, and accessibility of workers, particularly those of traditional skill, as in the manufacture of cutlery, steel, and pottery. In old days, climate influenced choice of site; the cotton industry was favoured by the damp of Lancashire; but air control and air conditioning have made natural climate less important. The buildings are so designed that the flow of work is continuous from intake of raw material to outflow of finished goods. Internal transport of goods is reduced to a minimum and mechanised as far as possible. Lifting gear and labour-saving devices are profitable, e.g. belt conveyors, mechanised trucks, travelling cranes, and even light railways. The principle of mass production is to bring the work to the several workers and so break down the job that each worker is engaged on a small operation. The resulting monotony raises problems of the welfare of the worker.

Increased use of electricity as a motive power has increased the flexibility of lay-out, and has improved the appearance and safety of workshops by abolishing large driving belts and shafting; while the extension of the grid system throughout the U.K. has relieved many of the lighter

industries of the necessity of generating power on the premises.

Generous expenditure and vigilant economy are both required to ensure success. The best firms do not hesitate to put back into the business large capital expenditure on new machines, lay-out, and buildings. Much saving has been effected by the utilisation of waste and by-products. Scarcity of fuel during the Second Great War led to further economies by the use of warm water from steam condensation, of rubbish as a source of heat, and the lagging of furnaces and boilers. Coal tar, once thrown away in the process of preparing coal-gas but now of greater value than the gas itself, is the classic example of a by-product. Sheets of tinned iron scrap from tinplate factories, formerly discarded as useless, are now chemically stripped and the recovered tin is used again.

#### Division of Work

The work in a factory is technically divided into two classes: (a) the actual process of manufacture, and (b) the services which facilitate it. The latter, subsidiary branch comprises the supply of power, maintenance of buildings, repair of tools and machines, packing and labelling finished products, and the care of the workers. A typical factory includes most or all of the following departments:

(a) *Manufacture*: Receipt and storage of raw material; actual manufacture in successive stages; finishing and assembling; packing, labelling, and analysis; dispatch. (b) *Services*: Transport by road, rail, or water; power (including water services, light, heat, and motive force—hydraulic, steam, or electrical); engineers' shop and stores; social service (rest rooms, canteens, etc.); time-keeping; accountancy; store-keeping.

Each manufacturing department is restricted to a single phase of the complex process of converting raw material into finished product. To coordinate the output of all these independent parts, so that none is kept idle by any other, requires the closest care. It is upon fine adjustments and economies that the margin of profit often depends. Under the general control of departmental managers, a foreman is in charge of each workshop and responsible for its output.

The length of the working day or week that will scientifically give maximum output varies with the individual and with the industry, but the war years showed that excessive hours of work do not produce commensurate output.

An increase in the care given to the welfare of the workers is one of the social advances arising out of wartime experience. Many firms improved conditions after the First Great War, supplying rest rooms, medical supervision, first-aid rooms, canteens, and recreational facilities, with the help of voluntary societies.

Wilfrid Garrett

**Factory Acts.** In the United Kingdom, a series of over twenty statutes, aimed at regulating conditions in factories and workshops, especially on behalf of women and children. The first was passed in 1802, Addington's Act, "for the preservation of the health and morals" of apprentices, etc., employed in cotton and other factories; child employees were not allowed to work more than 12 hours a day nor later than 9 p.m., and had to be taught the three Rs in working hours.

The Act of 1833 barred the employment of children under nine years of age at factories and provided *inter alia* for an eight-hour day for children under 13, for certain holidays, and for factory inspectors. The 1844 Act initiated the following interpretations, viz. "young person," between 13 and 18 years old; child, under 13 years; it laid down that women were to be employed on the same conditions as to hours as young persons, who, together with children, were not to work on Saturdays after 4.30; and regulated the fencing of machinery. The 1847 Act set up an eleven-hour day maximum for factory workers and a ten-hour day for women and young persons, with a 58-hour maximum for the week.

Lord Ashley (earl of Shaftesbury) was perhaps the most prominent of the reformers of abuses which for years disfigured the industrial system in the 19th century. Other Factory Acts were passed at intervals to safeguard the workers further from accident, disease, or oppression, and to provide for the education of children employed at factories before national education was adopted.

The Factories Act, 1937, consolidated the law, incorporating and amending the provisions of the Factory and Workshop Act, 1901, and later Acts. It contains general provisions as to health, safety, and welfare: including, under health, cleanliness, overcrowding, temperature, ventilation, lighting, drainage, sanitary conveniences; under safety, prime movers, transmission, construction and sale of new machinery, vessels containing dan-

gerous liquids, cleaning of machinery by women and young persons, hoists, lifts, chains, ropes, cranes, construction of floors, passages, and stairs, safe means of access, safe place of employment, dangerous fumes, explosive or inflammable dust or vapour, fire escape and precautions; under welfare, drinking water, washing facilities, first aid, space for clothing.

#### Welfare and Health Provisions

The Act next sets out special provisions as to health, safety, and welfare applicable to certain industries and processes dealing with the removal of dust or fumes, meals in dangerous trades—e.g. where lead or arsenic is used—protection of eyes by goggles or screens where there is a risk of injury from particles or fragments, installation of hydrometers in humid factories, the prohibiting of artificial humidification in underground rooms, basements, bakehouses, and laundries, lifting excessive weights, employment of women and young persons in certain processes. There are rules for the notification and investigation of accidents and industrial diseases, and concerning home work and piece work.

An abstract of the Act must be posted at the principal entrances of a factory. The Act is reinforced by detailed regulations made by the Home secretary. Failure to observe it is a criminal offence.

**Factory Inspector.** Class of British civil servants attached to the ministry of Labour. The inspectors are responsible for the proper administration of the Factories Act. They may enter and inspect a factory at any reasonable hour of the day or night, and may require the production of registers, certificates, etc. It is an offence to obstruct an inspector.

**Faculae** (Lat. *facula*, small torch). Areas of the sun's surface hotter and therefore brighter than the remainder. Dark sunspots are nearly always surrounded by facular areas, but faculae may appear unaccompanied by spots. These often mark disturbed regions which have given or are about to give rise to sunspots. See Sun.

**Faculties, COURT OF.** Court held on behalf of the archbishop of Canterbury to deal with cases arising from the legatine powers of the archbishop, administered partly by him personally and partly by the master of the faculties. These powers are concerned with the granting of special and ordinary licences for marriage in both provinces, Canterbury and York; the issue of dispensations to hold

two benefices in plurality; conferring Lambeth degrees; and the appointment of notaries. When disputes arise an appeal lies to the court of faculties, presided over by the dean of the arches, who is also the judge of the court of arches, the provincial court of Canterbury. The registrar's address is 1, The Sanctuary, Westminster, S.W.1. See Ecclesiastical Courts.

**Faculty** (Lat. *facultas*, faculty, ability). Any special mental power, e.g. the faculty of speech. This use of the word has come down from the early philosophers. Derived obviously therefrom is the use of the word for a department of a university, and for its instructors; thus in modern universities we have the faculties of arts, medicine, law, theology, science, etc. Similar is its occasional application to the members in a collective sense of a learned profession, e.g. the faculty of advocates in Scotland. In the U.S.A. the teaching staff of a university or college is called the faculty.

In English ecclesiastical law and usage the term means a permission to do something which is not allowed by the common law: e.g. to be married otherwise than after the publication of the banns, or to make an alteration in a church. For such matters as the altering of churches, putting up monuments, etc., therein, each bishop deposes his chancellor to hear the application. See Ecclesiastical Law.

**Fadden, ARTHUR WILLIAM** (b. 1895). Australian politician. He was born April 13, 1895, and entered politics in 1936 when he was returned to the house of representatives as member for Darling Downs, Queensland. He became minister for air in Aug., 1940, and commonwealth treasurer soon afterwards. Fadden succeeded R. G. Menzies as prime minister in a coalition government in Sept., 1941, but commanded no majority and resigned the next month after a vote of censure on the budget. He then led the opposition until 1943 and thereafter the Country party. In the Menzies 1949 cabinet he was again treasurer.

**Fading.** Term applied to the weakening of signal strength in radio reception. In medium and long wave transmissions the signal can travel to the receiver by two paths: the ground-ray comes direct, the sky-ray goes diagonally upwards and is reflected down again by the Heaviside layer (q.v.). Since these paths are of different lengths the waves may arrive in different phases and

interfere. Where the two rays are of much the same strength, and a trough in the one coincides with a crest in the other, they will cancel out and the signal fade. Since the effective height of the Heaviside layer depends on the radiation received from the sun, fading varies from day to night and from winter to summer, and shorter fluctuations (from 1/100 sec. to 15 min.) occur as a result of magnetic disturbances connected with sun spots. Fading in short wave transmissions is the result of interference between two or more sky-waves coming by different paths. Rapid fluctuations may wreck all long distance radio-communications during high sunspot activity.

**Faed, THOMAS** (1826-1900). A Scottish painter. Born at Gatehouse of Fleet, Kirkcudbrightshire, June 8, 1826, he studied art at Edinburgh, and painted many scenes of Scottish life, humorous and pathetic. A.R.S.A. in 1843, he came to London in 1852, and became A.R.A. in 1861, and R.A. in 1864. He died, Aug. 17, 1900, almost blind, at St. John's Wood. His *Faults on Both Sides*, *Silken Gown*, and *Young Highland Mother* are in the national collection, at the Tate Gallery.

**Faenza** (anc. Faventia). City of Italy, in the prov. of Ravenna. It stands on the Lamone, 31 m. by rly. S.E. of Bologna. Surrounded by medieval walls, it has for centuries been famed for its art pottery called "faience" (q.v.). On the principal square are the cathedral (1474), the former palace of the Manfredi, now the city hall, and the church of S. Michele. There is an arcaded market-place, and the municipal art gallery has frescoes, sculptures, and fine specimens of local majolica. Silk spinning, weaving, and sulphur refining are carried on. Founded by the Romans, Faventia was the scene in A.D. 542 of the defeat of the Byzantines by Totila, and was prominent in the medieval wars of the Guelphs and the Ghibellines. Captured in 1240 by Frederick II, Faenza fell successively to the Manfredi, the Borgias, Venetians, and the popes. Used as a German military base late in 1944, Faenza was captured by New Zealand troops of the 8th army on Dec. 16. Several palaces and museums were damaged in the battle, the Germans bitterly resisting the Allied forces. Pop., pre-war, 22,400.

**Faerie Queene, THE.** Poem by Edmund Spenser, published in 1590-96. The published poem consists of six books, divided into 12

cantos, between 50 and 60 stanzas in each canto, and is written in nine-line stanzas, each ending with a twelve-syllable line. The poem blends the Arthurian legend of knights errant with classical lore, Christian teaching, and allegory, both general (concerning the virtues and vices) and particular (concerning people of the poet's time). Devised as an allegory on a grand scale, and only half completed, it remains a wonderful medley of poetic romance, shot through with threads of allegory, full of descriptive beauty and rich verbal music.

**Faeringehavn.** Harbour on the S.W. coast of Greenland, opened in Dec., 1937. The harbour is free of pack-ice for the greater part of the year. Enlarged and provided with modern loading equipment, it became an important base during the U.S. occupation of Greenland in the Second Great War.

**Fafnir.** The treasure-guarding worm or dragon of Scandinavian and Teutonic mythology. In both a smith's brother is supposed to have been transformed into this form. In the Scandinavian *Volsung Saga*, Sigurd slays Fafnir, guardian of Ardvora's hoard, and is thereafter known as Sigurd Fafnirsbane; while in the *Nibelungen Lied* Siegfried kills Fafnir, who guards the Nibelung hoard.

**Fagaceae.** Family of trees. The fruit is enclosed in a cup. The family includes sweet chestnut (*Castanea*), oak (*Quercus*), beech (*Fagus*).

**Fagan, JAMES BERNARD** (1873-1933). British dramatist. He was born May 18, 1873, and educated at Clongowes Wood College and Trinity College, Oxford. He was trained as an actor under Benson and Tree, and his first play, *The Rebel*, was performed in 1899. It was followed by *The Prayer of the Sword*, 1904; *Under Which King*, 1905; *The Earth*, 1909; *A Merry Devil*, 1909; *And So to Bed*, 1926; *The Greater Love*, 1927; *The Improper Duchess*, 1932. Fagan returned to acting in 1913, and was long associated with the Playhouse, Oxford. He died in Hollywood, U.S.A., Feb. 17, 1933.

**Fagging.** Old-established system at English public schools under which the older boys are empowered by the school authorities to exact certain duties from the younger boys. The duties, formerly heavy, now consist of running errands, tidying studies, etc., and games fagging. The system, sometimes elaborately organized, varies at different schools. All boys are liable to fagging until they reach a certain form or have been

at the school a certain length of time. As a rule the prefects alone are entitled to fags, but some schools extend the privilege to the sixth form and also to the cricket eleven and football team.

**Faggot** or **FAGOT**. Term used in iron making. In one method of making wrought iron, a rough box of scrap or muck bars is filled with a mixture of iron and steel scrap. This faggot is then reheated and rerolled to expel more slag. The same term is used in the manufacture of shear steel; blister bars are hammered down at red heat to plated bars, which are then piled in groups of six, forming a faggot.

**Faggot Voter**. Name given to a class of voters, now non-existent, at elections in England. The main qualification for a vote in the counties was the ownership of land worth 40s. a year. When the system was instituted in the 15th century this meant a considerable estate, but in the 18th century it meant little. Landowners therefore gave patches of ground to their servants on the implied condition that they voted as their masters wished, a practice not destroyed till the Reform Act of 1834.

**Fagin**. Character in Dickens's novel *Oliver Twist* (*q.v.*). A disreputable old Jew, he is a prominent member of the criminal gang to which Bill Sikes belongs, his special province being the training of young boys to be pickpockets.

**Faguet, ÉMILE** (1847-1916). French critic and literary historian. Born at La-Roche-sur-Yon, Dec. 17, 1847, he became professor of poetry at the university of Paris, 1897, and a member of the Academy, 1900. His writings, which are characterised by a catholicity of taste and a flexibility of judgement reminiscent of Sainte-Beuve, include *La Tragédie au XVIe Siècle*; a series of studies of great French authors of the 16th, 17th, 18th, and 19th centuries; *Politiques et Moralistes du XIXe Siècle*; and monographs on Voltaire, Flaubert, and Zola. He died June 6, 1916. Consult *Émile Faguet*, A. Schéclé, 1904.

☉ **Fa-Hien** or **FA-HSIEN** (*f.* A.D. 400). Chinese traveller and antiquary. A Buddhist monk, he set out in 399 from the ancient capital Hsian-fu, Shensi, for a prolonged pilgrimage in the Buddha's cradleland. Traversing the Gobi desert, mostly afoot, to Khotan, he crossed the Hindu Kush into the Afghan valleys, and remained ten years, visiting Peshawar and the Ganges cities. He proceeded by sea in 412 to Ceylon, whence he

returned home in 414, with numerous pictures, images, and books. The account of his pilgrimage was translated into English by H. A. Giles, 1923.

**Fahlum** or **FALUN**. Town of Sweden, capital of the govt. of Kopparberg. It stands near Lake Runn, 57 m. by rly. W. of Gävle. The town was burnt down in 1761. Its only notable feature is the 14th century church, which escaped the fire. Minor buildings include the town hall, a mineralogical museum, and technical schools. Its copper mines, once the richest in Europe, now nearly exhausted, have been worked for six centuries, and the company owning them has existed since about 1345. Iron pyrites, gold, silver, and sulphur are still produced. Fahlum has railway wagon works, wood pulp factories, and textile industries. Pop. 15,327.

**Fahrenheit, GABRIEL DANIEL** (1686-1736). A German physicist. Born at Danzig, May 14, 1686, he spent his life chiefly in England and Holland, where he studied physics and constructed meteorological instruments. His name is commemorated by a thermometric scale. He died in Holland, Sept. 16, 1736.

**Fahrenheit Thermometer**. A scale for measuring heat invented by G. D. Fahrenheit. He obtained temperatures 32° below the freezing point of water, and fixed that degree of cold as the zero of his scale. The freezing point of water thus became 32° F. The difference in temperature between this and the boiling point of water Fahrenheit divided into 180 degrees, so that the latter is 212° F.

The Centigrade scale of temperature has the melting point of ice for its zero, and the boiling point of water is fixed at 100 degrees. Réaumur's scale (used in Germany) divides the difference between the freezing and boiling points of water into 80 degrees. To convert these scales:

$$F = \frac{9}{5} C + 32 = \frac{5}{9} R + 32 \\ C = \frac{5(F-32)}{9} \quad R = \frac{4(F-32)}{9}$$

See Centigrade; Thermometer.

**Faidherbe, LOUIS LÉON CÉSAR** (1818-89). French soldier. Born at Lille, June 3, 1818, he entered the engineers in 1840. Almost at once he saw service in Algiers, and in 1854 he was appointed governor of Senegal. France was entering upon her policy of acquiring colonies in Africa, and of this Faidherbe was a pioneer. Made general in 1863, he returned to France in 1870 to lead the armies of the north after the

disasters at Sedan and Metz. He showed great ability when fighting a number of battles against heavy odds, but at last he was beaten at St. Quentin, Jan. 19, 1871. For a short time he sat in the national assembly, and in 1879 he was elected to the senate. Faidherbe was also an Egyptologist. He died in Paris, Sept. 28, 1889.

**Faidit, GAUCELM** (c. 1159-1216). A French troubadour. Born at Uzerche in Limousin, the son of an artisan, he attracted by his singing the patronage of Richard Coeur de Lion. About 70 of his poems have been preserved, including a beautiful *planh*, or song of sorrow, in memory of Richard.

**Faience**. Term loosely used to designate every description of glazed pottery and earthenware painted with decorative designs. The name comes from the Italian city of Faenza, which has made a speciality of this kind of ware from the close of the 13th century. It had a soft paste and thin transparent glaze, which heightened the colours. The very rare French Oiron ware is called Henry II faience. Some varieties from Josiah Wedgwood's work are styled English faience. See Pottery.

**Failsworth**. Urban dist. of Lancashire, England. It is 4 m. N.E. of Manchester, with a rly. station. In the Manchester area, although just outside the city boundary, its main industries are connected with the manufacture of cotton. Gas and water are supplied from Oldham. Pop. 16,650.

**Fainting** or **SYNCOPE**. Temporary unconsciousness due to insufficient supply of blood to the brain. Among causes leading to the condition are defective action of the heart, sudden violent emotion, over-exertion, loss of blood, blows on the head or abdomen. A person about to faint feels giddy, and everything around him seems to be becoming dark. He turns pale, the pupils dilate, the skin becomes cold, and if standing he falls heavily. The pulse is weak and hurried.

Recovery is usually rapid. So long as he is unconscious, the person should be allowed to lie quietly on his back with his head as low as possible, and the clothing about the neck and chest should be loosened. If a person faints in a room the window should be opened, and if outside, onlookers should be sent away. Smelling salts may be held beneath the nose, but until consciousness returns nothing should be given by the mouth. When swallowing is possible, a little brandy or sal volatile in water

may be given. When feelings of faintness first come on, complete loss of consciousness can often be prevented by the person bending forwards and placing his head between his knees at as low a level as possible.

**Fair** (Lat. *feria*, holiday). Periodical assembly of traders at a place and time fixed by charter, statute, or immemorial custom. In early times certain localities came to be used for the periodical exchange of commodities, either by reason of their situation or because they were resorted to at stated times for religious or other purposes. In Greece the Olympic games and such religious festivals as those of Delos and Delphi provided occasions for trading. Among the Incas of Peru fairs were held thrice a month in the most populous places and were visited by the outlying agricultural populations. In ancient Mexico, fairs took place every fifth day in the chief cities.

The earliest royal charter for a fair was granted in 642 by the Frank king Dagobert to the monks of S. Denis, Paris. The concourse of worshippers at a famous shrine afforded great opportunities for trade, and nearly all medieval fair charters were granted to ecclesiastics. The fairs were usually held on a saint's day and on its vigil and morrow, and often, until prohibited by statute, in the churchyard. The religious associations of medieval fairs are indicated by the German word for "fair," *Messe* (mass), and in the term *kermesse* or *kirmess* (church mass) used for the quasi-religious carnivals of Brittany and the Low Countries. In every fair there was a court specially appointed for settling disputes, called in England pie-powder courts (*q.v.*).

#### Fairs and Trade

To promote trade, fairs were encouraged by the sovereigns of Europe. During fair time in the 10th century Otto the Great pronounced the ban on breakers of the peace and suspended the right of private feud. In the 14th century the emperor Charles IV's charter for the great fair of Frankfurt-on-Main declared fair-goers free from arrest and imperial taxes during the fair as well as for 18 days before and after.

Though fairs were invaluable for international trading, local traders were usually compelled to close their shops in fair time. During the Westminster fair the city tradesmen were commanded to shut their shops, and during the fair on St. Giles's Hill, near Winchester, which lasted 16 days, the Winchester and the Southampton shopkeepers were only allowed to

trade in the fair. The bishop of Winchester was the lord of the fair, and while it lasted the powers of the regular city officers were in abeyance. On the Eve of S. Giles the keys of the city gates were handed over to the bishop, who appointed a mayor, bailiff, and coroner of his own for the duration of the fair.

The influence of country fairs was far-reaching. In 1338 the statutes of St. Mary Ottery's College in Devonshire ordained that 200 lb. of wax for the choir should be bought annually at Winchester fair. In the 15th century the monks of Maxstoke and Bicester laid in their yearly stores at Stourbridge fair, and in the 16th century it was still customary for stewards of country houses to purchase their year's supply of household stores at remote fairs. With the improvement in communications the importance of fairs diminished, and by 1855 all those in London were abolished.

#### "Fun of the Fair"

Amusements formed an important feature of fairs, many of which became mere disorderly revels and were suppressed as nuisances. This was the fate of Donnybrook fair in Dublin, of Charlton or Horn fair, of Greenwich fair, and of all the London fairs. The "fun of the fair" included jugglers, mountebanks, rope-dancers, acrobats, wrestling and other sports, wild beasts, learned animals, freaks and monstrosities, puppet-shows, miracle plays, mysteries, moralities, and stage plays of every description; ballad-singing, grinning through horse-collars, swings, roundabouts, and, in modern times, steam music. Ballad-singers were very popular at fairs; Outroaring Dick and Wat Wimbles, two Elizabethan trebles, were paid as much as 20 shillings a day at Braintree fair. Of fairings, or gifts bought at fairs, the most familiar are the little gingerbread figures, usually gilt, possibly a survival of images of saints.

The most celebrated London fair was Bartholomew fair (*q.v.*), and among existing English livestock fairs may be mentioned those for horses at Horncastle (described in George Borrow's *Romany Rye*), Barnet, and Woodbridge; Weyhill, for sheep, and Ipswich, for lambs; Exeter, for cattle and horses; and Carlisle and Ormskirk, for cattle. Nottingham has a goose fair; Falkirk, a fair, or tryst, for cattle, sheep, and horses; and Ballinasloe, co. Galway, one for cattle. Gloucester cheese fair is well known. In parts of England and Wales, and in Scotland, servants were engaged at the hiring, or statute fairs.

On the continent of Europe, the Lyons fair is supposed to have been founded by the Romans and long enjoyed a great reputation; bills of exchange from all parts of Europe were often made payable at Lyons fair. The fairs of Champagne and Briè were world renowned, and are referred to as early as the 5th century. Those of Frankfurt-on-Main and Frankfurt-on-Oder and those of Leipzig, especially the great Easter book-fair, were the best known German fairs. The most important Russian fair was the Makaryevskaya fair at Nijni-Novgorod (Gorki), July 29–Sept. 10. Held from remote times at various points on the Volga, it was settled at Nijni in 1817, taking its name from a monastery near Makaryev, where it was formerly held. The fair once comprised over 8,000 shops as well as circuses, theatres, banks. Trade was carried on in cotton, woollens, silk and linen goods, furs, iron, corn, salt, etc.

In the Nile delta Tanta is famous for its fairs, held thrice yearly at the tomb of Said el Bedawi, a 13th century saint. One of the largest fairs in Asia is that at Hardwar, or Hurdwar, in Upper India. The Meccan fairs existed long before the time of Mahomet. In the U.S.A. the term denotes an industrial exhibition. See *Exhibition*.

**Bibliography.** Fairs, Past and Present, C. Walford, 1883; *Memoirs of Bartholomew Fair*, H. Morley, 1859; *Treatise on the Law of Markets and Fairs*, J. G. Pease and H. Chitty, 1899; *The English Circus and Fair Ground*, G. Tyrwhitt-Drake, 1946.

**Fairbairn, ANDREW MARTIN** (1838–1912). British theologian. Born near Edinburgh, Nov. 4,

1838, and educated at the university there and at Berlin, for some years he was a Congregational minister at Bathgate and Aberdeen. He became principal of the Airedale Congregational College, Bradford, in 1877, and in 1889–1909 was principal of Mansfield College, Oxford. He was Muir Lecturer at Edinburgh, Gifford Lecturer at Aberdeen, and Lyman Beecher Lecturer at Yale. He published numerous books chiefly on the philosophy of religion, among them *The Place of Christ in Modern Theology*, 1893, and *Philosophy of the Christian Religion*, 1902. He died Feb. 9, 1912.

Andrew M. Fairbairn,  
British theologian  
*Elliott & Fry*

**Fairbairn**, SIR WILLIAM (1789-1874). British engineer. Born at Kelso, Roxburghshire, Feb. 19,

Sir W. Fairbairn,  
British engineer

1789, the son of a farmer, in 1804 he was apprenticed to a millwright in Newcastle, and educated himself in his spare time. Coming to London in 1811, in 1817 he started in partnership with James Lillie an engineering business which proved successful. In 1830 he turned his attention to iron boat construction, and in 1835 opened shipbuilding works at Millwall. Moving thence to Manchester he invented a riveting machine, and superintended the construction of the Menai Bridge, 1848. He was made a baronet in 1869, and died Aug. 18, 1874.

**Fairbanks**. Town of Alaska. Situated on the river Tanana, it is the centre of government activities in the interior of Alaska, and is connected by the Alaska rly. with Seward (*q.v.*), 467 m. S. It is the N. terminus of the Alcan Highway (*q.v.*). Fairbanks became a U.S. air and army base during the Second Great War, and an experimental flying station was built on the outskirts. Pop. 3,455.

**Fairbanks**, DOUGLAS (1883-1939). American film actor. By name Douglas Ullman, he was born at Denver, May 23, 1883. Making his first appearance on the New York stage in 1901, he adopted the screen as his profession in 1914 and formed his own company in 1917. Athlete as much as actor, he endeared himself to audiences by the dash, verve, and charm with which he portrayed romantic historical and legendary heroes. His silent films included *The Three Musketeers*, *Robin Hood*, *The Thief of Bagdad*, *The Gaucho*, *The Iron Mask*; among his talking films were *The Taming of the Shrew*, *Around the World in 80 Minutes*, *The Private Life of Don Juan*. From 1920 to 1935 he was married to Mary Pickford (*q.v.*), and in 1936 to Lady Ashley. He died Dec. 12, 1939.

Douglas Fairbanks, junior (b. 1907), son of the above and his first wife, Beth Sully, was born Dec. 9, 1907, educated at Pasadena polytechnic school and Harvard military academy, and became a film actor. He first appeared in 1923, and in 1935 started his own company. The Amateur

Gentleman, *The Dawn Patrol*, *Catherine the Great*, *The Prisoner of Zenda*, *The Young in Heart*, were among his successes. Chairman of C.A.R.E., 1948, he was made an honorary K.B.E., 1949.

**Fairbridge**, KINGSLEY OGILVIE (1885-1924). South African founder of the movement for settling children from Great Britain on farm schools in the countries of the Commonwealth. Born at Grahamstown, Cape Province, May 2, 1885, he was a Rhodes scholar at Exeter College, Oxford, and formed, with 49 fellow undergraduates, the Child Emigration Society in 1909. He gained a diploma in forestry, sailed for Western Australia in 1912, and started with his wife the first Fairbridge farm school at Pinjarra with 35 boys. By 1934 the prince of Wales was appealing for £100,000 for more schools on the same model; the result was the founding of the Prince of Wales Fairbridge farm school on Vancouver Island, near Duncan; a fruit farm at Fintry, in the Okanagan Valley, B.C.; and another school at Molong, N.S.W. There is also a memorial college near Bulawayo, S. Rhodesia. Fairbridge, who was the author of *Veldt Verse* and other poems, and an autobiography, died July 19, 1924, at Perth, W. Australia.

**Fairey**, SIR (CHARLES) RICHARD (b. 1887). A British aeronautical engineer. He was born May 5, 1887, and educated at Merchant Taylors' and Finsbury technical college. He was manager of the Blair-Atholl Aeroplane Syndicate, 1911-13, and in 1915 founded the Fairey Aviation Co., Ltd., which produced in the Second Great War such famous types as the *Battle* (*q.v.*), *Swordfish* (*q.v.*), *Albacore*, *Barracuda* (*q.v.*), *Fulmar* (*q.v.*), and *Firefly* (*q.v.*). Fairey was president of the Royal Aeronautical Society, 1930-31 and 1932-33, being awarded its Wakefield gold medal for the invention of wing flaps. In 1942-45 he was director-general of the British air commission at Washington, receiving a knighthood. Fairey was also a yachtsman.

**Fairfax**, FERDINANDO FAIRFAX, 2ND BARON (1584-1648). English soldier. The son of a Yorkshire landowner, he was born March 29, 1584, and when young served against Spain in the Netherlands. In 1640 he succeeded his father as Baron Fairfax of Cameron, a Scottish title dating from 1627, but this did not prevent him from becoming a member of the Long Parliament. Therein, taking the

side of the parliament, he was chosen to command its forces in Yorkshire when war began in 1642. He served for about two years, but met with only one or two minor successes; he was routed at Adwalton Moor, and driven from the field at Marston Moor. He died March 14, 1648.

**Fairfax**, THOMAS FAIRFAX, 3RD BARON (1612-71). English soldier. The son of the 2nd baron (*v.s.*), he was born at Denton, Yorks, Jan. 17, 1612. Hewent to S. John's College, Cambridge, after which he saw military service in the Netherlands. In 1640 he fought against the Scots, but when the civil war began in 1642 he and his father were prominent among the king's opponents. Thomas was present at Marston Moor in 1644. On the passing of the self-denying ordinance, he was made commander-in-chief of the parliamentary armies, and as such gained the victory at Naseby. At the end of the first period of the war he was something of a national hero.

He had little sympathy with the policy of the more violent of the army leaders. He helped to put down the royalist rising in 1648, and was one of the judges appointed to try Charles I; but when the trial began he refused to sit, and in 1650 he refused to march against the Scots and resigned his position as head of the army, receiving a pension of £5,000 a year. In 1659-60 he helped Monk to place Charles II on the throne, going as head of the deputation to The Hague. He was elected as M.P. for Yorkshire to the new parliament, and that was the end of his public career, although he lived until Nov. 12, 1671. Fairfax was a man of culture who wrote two accounts of his campaigns, verses, and made translations. His correspondence was published in four volumes, 1848-49. The Great Lord Fairfax, by Sir C. R. Markham, appeared in 1870.

Thomas Fairfax, who became the 6th baron, sold Denton Hall, the Yorkshire seat of the family, and settled in Virginia, where he lived in princely splendour. His brother, the 7th baron, died without sons, and the title passed to

From an engraving

a distant relative. For a time, the heirs being American citizens, it was not claimed, but in 1912 Albert Kirby Fairfax (1870-1939) was permitted by the house of lords to call himself 12th baron. Dying Oct. 4, 1939, he was succeeded by his son Thomas (b. 1923).

**Fairfax, SIR JAMES READING** (1834-1919). An Australian newspaper proprietor. Born at Leamington, England, Oct. 17, 1834, he joined the staff of his father's paper, the Sydney Morning Herald, in 1851. Five years later he became a partner, and during the remainder of his life was actively engaged in the management of the Sydney Mail, which he founded. Knighted in 1898, he was president of the national art gallery of N.S.W. He died March 28, 1919.

**Fairfield.** Mountain in Westmorland, England. Its peak reaching 2,863 ft., it lies S. of Helvellyn and can be ascended from Grasmere. Fairfield is also the name of suburbs of Liverpool, Manchester, and Buxton.

**Fairford.** Parish and village of Gloucestershire, England. It stands on the Coln, 25 m. W. of Oxford, with a station on a branch rly. Its 15th century church, dedicated to S. Mary, and built by John Tame, a London merchant, contains some of the most wonderful stained glass in the country. The 28 windows figure the whole story of the Creation and of the work of Jesus Christ. The village has a fair, was formerly a centre of cloth manufacture, and is visited for trout fishing. It was the birthplace of John Keble. In the neighbourhood are Hathrop Castle and Fairford Park. Pop. 1,365.

**Fair Head OR BENMORE.** Headland on the N. coast of Antrim, N. Ireland. It is  $4\frac{1}{2}$  m. N.E. of Ballycastle, is 636 ft. high, and being a sheer precipice from a height of 320 ft. presents a superb basaltic columnar formation.

**Fairing.** A cover or casing placed over certain parts of an aeroplane, motor vehicle, or railway train so that the aircraft or vehicle offers the minimum resistance to the air when travelling at speed. Fairing is a fundamental part of streamlining; in streamlined motor vehicles such protuberances as door handles, headlamps, etc., are faired into the body and wings. On streamlined trains the smoke-stack is faired into the boiler covering and the coachwork of the carriages is clean-swept from the roof to within a few inches of the rails. On air-

craft protuberances are reduced to a minimum by fairing them into the fuselage and wings.

**Fair Isle OR SHEEP ISLE.** One of the Shetland Is., about equidistant from Mainland in that group

Fair Isle, Shetland Islands, from the east, with the lighthouse on the southern extremity  
Valentine

and the Orkney Is. It is 3 m. long and 2 m. broad, and rises to 480 ft. in Sheep Craig on the E. coast. Fishing and sheep-rearing are engaged in, and the island gives its name to a characteristic style of knitting popular for pullovers and jumpers. This may have been learnt from Spaniards of the Armada who were wrecked here. The island has two lighthouses, and is in telegraphic communication with the mainland. Long a bird sanctuary, Fair Isle in 1948 became the property of an Edinburgh ornithologist. Pop. 100.

**Fairlie.** Parish, village, and watering-place of Ayrshire, Scotland. It stands on the Firth of Clyde, 2 m. S. of Largs by rly. It has a yacht-building yard, and castle ruins. Pop. 1,288.

**Fair Maid of Perth, THE, OR SR. VALENTINE'S DAY.** Romance of Scotland in the last years of the 14th century. Published in May, 1828, it forms the second series of Scott's Chronicles of the Canongate. The titular heroine is Catharine, the beautiful and devout daughter of Simon Glover, Burgess of Perth. In addition to the unique study of the Highland lad Conachar (Eachin Mac-Ian), nominally Simon's apprentice, who is destined to be the last chief of the Clan Quhele, and whose inherent cowardice offers a striking contrast to the dauntless courage of Henry Smith (Hal of the Wynd), the armourer who is also Catharine's suitor, the story contains a vivid description of the Palm Sunday battle on the North Inch between the champions of the rival clans Chattan and Quhele.

**Fair Oaks, BATTLE OF.** Federal victory in the American Civil War, May 31-June 1, 1862, also known

as the battle of Seven Pines. In command of the Federals, McClellan was forcing Johnston back upon Richmond when the Southern general made a stand as the Federals were crossing the Chickahominy river. Two of McClellan's corps were already to the S. of the river when they were attacked by Longstreet. Reinforcements were hurried up, and stubborn fighting took place, during which Johnston was severely wounded, being succeeded by G. W. Smith. The next day, June 1, Longstreet's attack was repulsed, and Lee arrived in time only to withdraw the Confederate army to Richmond. About 42,000 men were engaged on either side. The Federal losses were 5,000, the Confederates losing more than 6,000.

**Fair Trade.** Term much used in the United Kingdom during the latter part of the 19th century for what was later called tariff reform. It was used by the opponents of free trade, who demanded that the United Kingdom should admit the goods of other nations only on the same terms as British goods were admitted by them. After languishing for a time the cause revived early in the 20th century in the shape of Tariff Reform. See Free Trade; Tariff Reform.

**Fair Wages Clause.** Clause which, in accordance with a resolution of the British parliament, must be included in all government contracts and which requires contractors to pay wages and observe hours and conditions of labour not less favourable than those established in the district by negotiation or arbitration between employers' organizations and trade unions. Workers must be free to join a trade union. The contractor must see that his subcontractors observe the clause. It is included in contracts made by local authorities, in other contracts involving expenditure of public money, and in industries regulated by Act of parliament, such as the sugar and film industries, road and air traffic, navigation.

The first resolution requiring a fair wages clause was introduced in the house of commons by Sidney Buxton in 1891. The form was amended in 1909 and 1946. The clause was necessary because some

employers in their anxiety to obtain government contracts put in very low tenders which could be made profitable only if they cut their rates of wages. Without it public contracts would tend to go to the worst employers.

**Fairway.** Navigable part of a river or other channel. It is continually under supervision to keep it free from obstructions. The term is used in golf for the direct path of short grass between tee and green.

**Fair Wear and Tear.** Term used in contracts. It is frequently provided in tenancy agreements or in agreements for the hire of chattels that the tenant or hirer shall be bound to keep the house or chattel in good repair, "fair wear and tear excepted." The phrase has been used in legal documents for centuries. Its effect is to negative any liability for (1) damage due to the normal or ordinary operation of natural causes such as wind and weather as distinct from damage due to abnormal natural events such as lightning, hurricane, flood, or earthquake; (2) damage caused by the tenant either unintentionally or as a normal incident of a tenant's occupation or use.

**Fairweather.** A mountain of Alaska, U.S.A. It is a volcano in the St. Elias Range, alt. 15,300 ft.

**Fairy.** Legendary or mythical being common to the folklore of most peoples. Fairies are manifested in varied forms, from tiny creatures in human shape which haunt the flowers, to the ordinary size of human beings. They are, however, generally regarded as relatively small, whence it has been surmised that the origin of the fairy myth is to be found in a dim antiquity when surviving races were in conflict with smaller races that have become extinct. The discovery of the African pygmies has lent colour to this; Sir Harry Johnston pointing out that the actions of those dwarf people again and again suggested the traits attributed to the brownies and goblins of fairy lore. Fairies in their many manifestations are sometimes friendly and beneficent, sometimes mischievous and malevolent.

The term is occasionally employed as covering the whole field of terrestrial supernatural beings; hence Fairyland is a sort of fourth dimensional world that coexists with that in which we live, and the term fairy stories is applied to all tales introducing earthly beings of an extra-natural character. In poetry and modern fairy stories the fairy is generally represented

as a tiny dainty creature. Since fairy originally meant enchantment, and then fairy people collectively, a single fairy is better called fay, Fr. *fée*, Ital. *fata*, from late Lat. *fata*, a fate or fay, the neut. pl. of *fatum* being used as a singular. See Brownie; Changeling; Elf; Folklore; Gnome; Goblin; Puck; Sylph.

**Bibliography.** Teutonic Mythology, Jakob Grimm, 1835 (Eng. trans. J. S. Stallybrass, 1880-88); Fairy Mythology, T. Keightley, 1847; Science of Fairy Tales, E. S. Hartland, 1889; British Fairy Origins, L. Spence, 1946.

**Fairy Ring.** Ring of a more vivid green than the surrounding grass of fields, fancifully ascribed to fairies dancing in a circle at night. It is actually caused by the growth of certain species of fungi—notably the fairy-ring champignon (*Marasmius oreades*)—which, starting from the centre, extend their underground threads (*mycelium*) in all directions, forming a circle increasing every year.

**Fairy Shrimp** (*Chirocephalus diaphenus*). Species of fresh water crustacean belonging to the sub-class Entomostraca. Within this sub-class is the primitive order Branchiopoda, containing two sub-orders Cladocera and Phyllopoda. The fairy shrimp is a phyllopod; a beautiful creature, semi-transparent, it is not widely found but is reasonably plentiful in certain parts of England.

**Faisans, ÎLE DES** (Fr., Pheasants' Isle). Island in the river Bidassoa, lying between France and Spain, about 15 m. S.E. of San Sebastian. Its position between two frontiers made it on two notable occasions the meeting-place of French and Spanish negotiators. Louis XI and Henry IV of Castile met here in 1463, and Mazarin and Don Luis de Haro here concluded the treaty of the Pyrenees in Nov., 1659, by which Spain ceded Artois and other northern possessions, and gave up her claims to Alsace and Lorraine, while France gave up territory taken in Italy and N.E. Spain.

**Faith** (Lat. *fides*). In ordinary speech a term used to denote the leap of the mind from the known to the unknown. In the sphere of nature it signifies the acceptance of fundamental assumptions which in themselves are incapable of logical demonstration. The law of the Uniformity of Nature, for instance, is an act of scientific faith enunciating a universal principle on the basis of certain established data. The fact that the sun has invariably risen at daybreak does

not in itself afford a demonstrative proof that it will always rise, but justifies our faith that it will. In the sphere of human relations the term is also employed to denote the confidence which we feel in other men whose character and integrity are known to us.

From ordinary usage the term naturally passed into the religious sphere—to which it pre-eminently belongs—and is commonly used to describe the faculty or organ of the soul by which a man grasps the realities of the unseen and divine universe. What the eye is to the body, faith is to the soul. It is the medium or instrument by means of which the soul enters into communion with God.

Philosophers and theologians have made many attempts at a psychological analysis of the faculty of faith. Some have held that it is a divine endowment—a special religious sense, created in the soul for the purpose of the exercise of spiritual functions. Others have regarded it as an aspect of the emotions analogous to the aesthetic sense. A third school has made it a department of the intellectual side of human nature; while a fourth has located it in the activity of the will. All these theories are inadequate, for intellect, feeling, and will are all involved in the act of faith, which has been defined as "a resolution to stand or fall by the noblest hypothesis."

Corresponding to these different views as to the character of the organ of faith, there are similar divergences of opinion as to the scope of its activity. Even in the N.T. the term is used in three different senses. In the Epistle of James it is employed to signify the intellectual assent of the mind to the primary Christian beliefs, and from this use of the word has grown up the conception which identifies faith with the acceptance of a creed. In the Epistle to the Hebrews, on the other hand, faith is defined as "the assurance of things hoped for, the proving of things not seen," words which Dr. Moffatt has paraphrased, "Faith means we are confident of what we hope for, convinced of what we do not see." It is out of this interpretation of faith that Christian mysticism developed. To the Apostle Paul faith has still a deeper significance. It implies nothing less than the complete surrender of the soul to Christ as its Redeemer and its Lord. - And it is to this great idea of faith that the Evangelical interpretation of Christianity owes its genesis and inspiration.

**Faithful.** Character in Bunyan's *Pilgrim's Progress*. He meets Christian during his journey to the Celestial City and the two travel together to Vanity Fair, where Faithful is put on trial, condemned to death, and burnt, but is taken up to the City in a chariot.

**Faithfull, EMILY** (1835-95). A British publicist. Born at Headley rectory, Surrey, and educated at

Emily Faithfull,  
British publicist  
Downey

Kensington, she devoted the greater part of her life to advocating the claims of women to remunerative employment. In 1860, in Great Coram Street, London, she founded a printing office in which women were employed as compositors, and for which she secured the approval of Queen Victoria. Later, in Farringdon Street, she formed the Victoria Press, and was appointed printer and publisher in ordinary to the queen. In 1863 she started a monthly entitled *The Victoria Magazine*. In 1868 she issued a novel, *Change upon Change*. Her lectures in the U.S.A., 1872-73, were described in her *Three Visits to America*, 1884. She received a civil list pension of £50 in 1889 and died May 31, 1895.

**Faith Healing.** Cure of disease by faith in the healing power of God. In the early Church the practice of anointing the sick for the purpose of curing them was a normal function of the clergy, and still survives in an altered form and with different intention in Extreme Unction. In medieval days the touch of a saint or of his relics was resorted to for healing; and down to the time of Queen Anne the British sovereign used to touch persons to cure them of scrofula.

The practice of faith healing is common among certain Protestant bodies, such as the Peculiar People and Four-square Gossellers. Most of the miracles at Lourdes and elsewhere are probably examples of faith healing. Such cures are usually effected in functional and nervous complaints, not in cases of organic lesion; and medical science attributes them to the power of suggestion upon the minds of persons who are at the time in a state of strong religious emotion. See *Christian Science*.

**Faithorne, WILLIAM** (1616-91). English engraver. Born in London, he studied painting and draw-

ing under Robert Peake, and engraving with John Payne. Made prisoner by the Roundheads in the Civil War, he pursued his art in Aldersgate prison, and on his liberation proceeded to Paris, becoming a pupil of Robert Nanteuil. Returning to London in 1650, he set up as a print-seller near Temple Bar, retiring 1680. He was buried at Blackfriars, London, May 13, 1691. Faithorne engraved portraits of most of the conspicuous figures of the Commonwealth and Restoration after Van Dyck, Lely, Dobson, and others, among them the notorious Lady Castlemaine. His portraits of Charles I, Charles II, James II, the duke of Monmouth, Milton, Killigrew, and Hobbes may be mentioned.

**Faiyum.** Another spelling of the name of the province in Upper Egypt described as Fayum.

**Faizabad** or **FYZABAD.** Division, district, and town of Oudh, United Provinces, India. Faizabad city, the administrative headquarters (with cantonment) of the district, is situated at the junction of three branches of the Oudh and Rohilkhand rly., and forms with Ajodhya a single municipality. Its chief industry is sugar refining, and it has a large agricultural trade. It is the terminus of the river steamers on the Gogra. The main crops of the district are rice, grain, wheat, lentils, peas, barley, and sugar-cane. Pop., div., 7,583,538, 75 p.c. Hindus; dist., 1,319,425, 90 p.c. Hindus; town, 57,632, 70 p.c. Hindus.

**Fakenham.** Parish and market town of Norfolk, England. It stands on the Wensum, 24 m. by rly. E.N.E. of King's Lynn. It has

two railway stations, one mile distant from each other. The chief building is the church with a lofty tower. Pop. 2,843.

**Fakir** (Arab. *fakir*, beggar). Religious devotee, especially in India. Fakirs number perhaps a million, the majority of them being Mahomedans, while others are Hindus, Sikhs, or Jains. The Mahomedans are orthodox members of the marrying dervish orders or unorthodox celibate mendicants who dispense with abstinence, fasting, and prayer. The Hindus include members of the monastic yogi orders devoted to education and poor relief, besides mendicant vagabonds who practise jugglery and resort to mutilations and austerities. See illus. below.

**Fal.** River of Cornwall, England. It rises near Roche, flows S. and S.W. 23 m. to the English Channel at Falmouth, and is navigable for nearly 10 m.

**Falaba.** British liner torpedoed by the German submarine U28 S. of St. George's Channel, March 28, 1915. She sank in a few minutes with the loss of 100 lives. At the inquiry it was stated that the submarine was flying British colours and its crew wore khaki. The Germans attempted to justify this attack by saying that it was a return for Great Britain's attempt to starve out Germany. The Falaba, 4,800 tons, belonged to the Elder Dempster Co.

**Falaba.** Town of Sierra Leone, W. Africa. It is fortified, and lies near the frontier of French Guinea, 170 m. N.E. of Freetown, at the junction of many trade routes. There is trade in palm kernels and kola nuts.

Fakir. 1. Undergoing thirst ordeal; with the river by his side and jars of water overhead, he abstains from drinking. 2. Lying on a bed of thorns. 3. Rolling his way from shrine to shrine. 4. Seated on a bed of nails

**Falaise.** Town of France, in the dept. of Calvados. It stands on the Ante, 20 m. S.S.E. of Caen. It is an agricultural centre, and Guibray, a suburb, is noted for its horse and cattle fairs. Other industries are tanning and the manufacture of hosiery, cottons, and dyestuffs. The chief churches were S. Gervais, with its fine Norman tower and some beautiful stonework, and the Trinity; the former was destroyed and the latter badly damaged in the Second Great War. The most interesting building is the ruined castle, famous as the birthplace of William the Conqueror and at one time the residence of the dukes of

Falaise. The castle where William the Conqueror was born. Top. Post war rebuilding in the devastated town; granary, completed 1947  
Top photo, The Times

Normandy. It is on a hill above the town. Near the town hall is an equestrian statue of William the Conqueror by Louis Rochet was erected in 1851. As part of Normandy, Falaise was long a possession of the English kings. In 1450 it was finally captured by the French.

**BATTLE OF THE FALAISE GAP.** In mid-Aug., 1944, the Allied armies in Normandy were fighting to encircle the main body of the German 7th army by closing the Falaise-Argentan gap. British and Canadians were pressing S. towards Falaise and U.S. and French armoured units advancing N. to Argentan. By Aug. 15 the gap was only 10 m. wide and about half the German army had withdrawn. Falaise was captured by Canadians on Aug. 17, having been reduced to ruins, and U.S. troops were fighting in Argentan. Two days later the gap was closed by the Allied meeting at Chambois, and by Aug. 22 the pocket was eliminated. About 100,000 Germans were accounted for, either as casualties or as prisoners, in these operations.

during the civil war of 1936-39. At first the organization showed tendencies towards radicalism, but the Conservative military caste in the movement seized control, Franco became the head, and on April 19, 1937, the Falangists, Carlists, and other political groups in the nationalist movement were united under the title Falange Española Tradicionalista. The army was incorporated into the Falange and the influence of its national council considerably increased thereby.

As reconstituted by Franco, the Falange consisted of thirteen elements: the caudillo, or leader; the national council; the political junta; its president; the secretary general; the national delegates; the national inspectorates; the militia and syndicates; the internal services,

the regional inspectorates; the provincial groups; the local groups; and individual members. Personnel of the army, navy, and air force became individual members. The Falange was the sole political party permitted in Spain and was ruled by a national council of 100 under the presidency of Franco. In July, 1942, the Spanish cortes was re-established on Falangist lines. The Falangist militia, dissolved on Dec. 20, 1943, was incorporated into the army.

A Falangist party established in Mexico, 1937, was abolished by the government on April 5, 1939.

**Falashas** (Ethiop., strangers). Communities of Hamitic stock, mainly between Axum and Gondar, in Abyssinia. Although allied racially to the Galla, and ignorant of Hebrew and the Talmuds, they profess Judaism, there being three distinct sects. They are farmers and artisans, speaking an Abyssinian (Agao) dialect, and they practise a rigid racial and ritual exclusiveness with which various pagan observances are mingled.

**Falces.** Town of Spain, in the prov. of Navarre. It stands in a plain between the rivers Ebro and Arga, 30 m. S.W. of Pamplona. It has ruins of a Roman castle, but is chiefly known for the mineral springs in the vicinity.

**Falchion.** Type of sword used in medieval times. Usually slightly curved and rather heavy, the blade was broader towards the point than at the hilt. The word comes from Lat. *falx*, sickle. See *Sword*.

**Falcon** (Lat. *falco*). Name applied generally to the family of birds of prey Falconidae, which includes falcons, hawks, kites, and eagles; but more especially to the genus *Falco*, which includes the true falcons, the peregrine falcon, and the kestrels. All these have short, curved beaks with one notch in the upper mandible, round

Falcon. Two species found in the British Isles: left, the peregrine falcon; right, Scandinavian jer-falcon

nostrils, short pointed wings, and long toes.

Several species of falcon are found in Great Britain. Of these the peregrine falcon builds sparsely on cliffs in the S. of England. It preys mainly on birds, and its ravages among game are compensated by the fact that it attacks only the weaklings, and thus tends to maintain the strength of the breed. It was formerly trained to bring down birds in hawking.

Other species which occur in the British Isles are the Greenland falcon, the Iceland jer-falcon, and the Scandinavian jer-falcon, all of which are occasional winter visitors. The birds take their name from the hook-shaped claws (Lat. *falx*, sickle). See *Hawking*.

**Falcon.** Volcanic island of the Tonga or Friendly Islands. It is in lat. 20° 20' S. and long. 175° 20' W. It made its appearance above the ocean on Oct. 14, 1885, after a volcanic eruption. It disappeared for a time, but was again uplifted.

**Falcón.** Maritime state of N. Venezuela, facing the Gulf of Maracaibo and Caribbean Sea and bounded S. by the state of Lara. It has been a separate state since 1904, when it was separated from Zulia. The coastal region is low-lying and sterile, but inland there are several ranges of hills with fertile valleys. Agriculture and stock-raising are the chief industries; coffee, cocoa, sugar, cotton, tobacco, and maize are produced. Coal is worked in small quantities, but the mineral resources of the state are virtually untapped. The capital is Coro. Pop. 232,644.

**Falcone, ANIELLO** (1600-65). Italian painter. Born in Naples, he was a pupil of Ribera, and became famous as a spirited painter of battle scenes. During the insurrection of Masaniello, 1647, Falcone gathered a band of his friends and pupils, among whom was Salvatore Rosa (*q.v.*), and this "Company of Death" made many Spaniards pay with their lives for the murder of the leader's nephew and of one of his pupils. Pictures painted of these events are in the museum at Naples. Falcone worked in Paris from 1648 to 1656, when he returned to Naples, where he died. His *Fight between Turks and Cavalry* is in the Louvre.

**Falconer, HUGH** (1808-65). Scottish botanist. Born at Forres, Feb. 29, 1808, Falconer was educated at Aberdeen and Edinburgh universities, and entered the service of the East India Company as a surgeon in 1830. His chief interests, how-

Faldstool or portable Litany desk of carved oak

ever, were in palaeontology and botany: he discovered remains of mastodon and other fossils, experimented in tea-planting in India, introduced cinchona bark as a remedy for malaria, and discovered the *asafoetida* plant, used in medicine. Returning to England, he arranged the Indian fossils at the British Museum, 1844-47, and then returned to India as professor of botany and curator of the botanical gardens of Calcutta, where he worked until 1855. He died in London, Jan. 31, 1865.

**Falconer, SIR ROBERT ALEXANDER** (1867-1943). A Canadian scholar. Born Feb. 10, 1867, at Charlottetown, Prince Edward Island, he was the son of a Presbyterian minister. His education, begun in Trinidad, was continued at Edinburgh and German universities, after which, in 1892, he returned to Canada and was ordained in the Presbyterian ministry. In 1904 he was made principal of Pine Hill College, Halifax, and was president of Toronto university, 1907-32. He wrote *Citizenship in an Enlarging World*, 1928; *Immortality and Western Civilization*, 1930. Knighted 1917, he died Nov. 6, 1943.

**Falconer, WILLIAM** (1732-69). Scottish poet. Born at Edinburgh, Feb. 11, 1732, the son of a barber, he became a sailor, and wrote *The Shipwreck*, 1763, a realistic poem, and a *Marine Dictionary*, 1769. He joined the navy, and in Sept., 1769, sailed for India in the frigate *Aurora*, which was lost off Cape Town, with all hands.

**Falconry.** The sport of hawking and the breeding and training of hawks, more usually known as hawking (*q.v.*).

**Faldstool** (late Lat. *faldistorium*; Ger. *falten*, to fold, *Stuhl*, stool, seat, or throne). Portable

crossed or folding stool so constructed that it can be used as a *prie-dieu* or kneeling desk or a seat. In England it was used by bishops when occupying a seat in the sanctuary other than their throne, or when visiting a church other than their cathedral; and it is still used in Roman Catholic churches. The term is applied to the small, low desk at which the Litany is enjoined to be sung or said, and to the stool at which a sovereign kneels at his coronation. The *faldistorium* on which Queen Mary sat at her marriage with Philip II of Spain is preserved in Langton's chapel, Winchester Cathedral.

**Falemé.** River of Senegal. It forms part of the boundary between the Senegal and French Sudan colonies. It rises in French Guinea in the watershed separating the Gambia and Bafing rivers, and runs N.N.W. to the Senegal river, which it enters near Bakel. It is navigable over part of its course for small boats during the wet season. Its length is 200 m.

**Falerii.** Ruined city of Etruria. Its site is near the modern town of Cività Castellana, 35 m. N. of Rome. One of the league of 12 Etruscan cities, its origin is lost in antiquity, but it was destroyed by the Romans, 241 B.C. The inhabitants built a new town 3 m. N.W. of the original site. Of the Roman *Falerium Novum* there are many remains, the walls, towers, and gateways being well preserved, and reputed to be among the most remarkable specimens extant of ancient military architecture. The town was deserted early in the 11th century.

**Falernian Wine.** Famous wine of the ancient Romans. It was light in colour and potent. A wine produced in the district, which is a fertile plain in Campania, near the Volturno river, is called Falerno.

**Falguière, JEAN ALEXANDRE JOSEPH** (1831-1900). A French sculptor and painter. Born at Toulouse, Sept. 7, 1831, he studied at the Beaux Arts under Joffrey, and at Rome. His work was at first classical in manner, but afterwards became strongly realistic. A marble statue of Tarcisus, boy martyr, now in the Luxembourg, was his crowning success; one may cite also the statue of Lafayette in Washington, a monument to Joan of Arc, a quadriga on the Arc de Triomphe, Paris, and a painting *The Wrestlers*. Falguière died April 19, 1900.

**Faliero, MARINO** (1279-1355). Doge of Venice. He defeated the Hungarians at Zara in 1346, and

captured the city. Elected doge in 1354, his troubles began with the defeat of the Venetian navy by the Genoese. The unrest caused by this disaster aroused Faliero's ambitions. He allied himself with the leaders of the populace, and a plot was hatched to murder the leaders of the nobility on April 15, 1355, and proclaim Marino prince of Venice. The Council of Ten, learning of the plot, seized Faliero, who confessed his share therein and was executed April 17.

**Falkenhausen,** FRIEDRICH, BARON VON (1869-1936). German soldier. He was born at Potsdam, and entering the army in 1887 had a distinguished career. He commanded the 6th army corps, 1916-17, and in April, 1917, succeeded von Bissing as governor-general of Belgium, where his rule was more oppressive than that of his predecessor. In the course of one year he had 170 Belgians shot, and he authorised severe penalties, deportations, and floggings. He died May 4, 1936.

During the Second Great War another von Falkenhausen, Alexander Ernst

(b. 1878), nephew of Ludwig, came into prominence as military governor in Belgium and N. France, 1940-44. He had been a staff officer with the

A. von Falkenhausen, German soldier

Turkish army in Palestine during the First Great War, and later was commander of the infantry school at Dresden, retiring 1930 as lieutenant. Anti-Nazi in his convictions, he served as head of a German military mission to Chiang Kai-shek, 1934-38, remaining as his adviser until recalled by Hitler to active service. Consistent opposition to the S.S. led to his dismissal and internment in a concentration camp shortly before the "July plot" of 1944. Released by British forces at the end of the war, he was held as a witness by U.S. authorities until 1947.

**Falkenhayn,** ERICH VON (1861-1922). German soldier. He was born at Burg Belchau, Sept. 11, 1861, and entered the army in 1880. After leaving the academy of war in Berlin in 1890 he joined the general staff. In 1913 he was appointed minister of war, which post he held at the outbreak of the First Great War; but in Dec., 1914, he was appointed chief of the

general staff, and was its responsible head till removed in Aug., 1916, owing to the failure of the German offensive at Verdun. Next month he was commander-in-chief of the 9th army, and launched the Rumanian campaign. He later went to the Middle East to direct the Turkish operations against the British in Palestine and Mesopotamia, but not being successful was recalled and replaced by Liman von Sanders in March, 1918. By many, Falkenhayn was regarded as the ablest strategist produced by Germany during the First Great War. He died April 8, 1922.

**Falkenhorst,** NIKOLAUS VON (b. 1885). German soldier. He commanded an army corps in the German invasion of Poland in 1939, and in 1940 was appointed commander-in-chief of the German occupation forces in Norway. In 1941 he was given command of the German armies in the N. sector of the Russian front, but after reverses in 1942 was relieved of his command. Sentenced to death by a British war crimes court at Brunswick, Aug. 2, 1946, for having ordered commandos to be shot, he was reprieved and imprisoned for life.

**Falkirk.** Parl. and mun. burgh and market town of Stirlingshire, Scotland. It is 22 m. N.E. of Glasgow, and is served

Falkirk arms

by two rly. lines. Falkirk, the boundary of which embraces the suburbs of Laurieston, Grahamston, Bainsford, and Camelon, is connected by rly. with Grangemouth (3 m. N.E.). its port on the Firth of Forth, and is the centre of a busy ironworking and colliery district. The great Carron ordnance works was founded in 1760. Today the main manufactures are light castings, pipes, ranges, and stoves. Brewing, dis-

tilling, tanning, and the manufacture of bricks, tiles, chemicals, and enamelled goods are flourishing industries. The famous cattle "trysts" or open sales, which were held thrice yearly, have been superseded by weekly markets (Tues.). At Westerglen is the B.B.C. Scottish regional transmitter. Falkirk became a burgh in 1600. Its first church was built by Malcolm III (Canmore). With Grangemouth and Stirling it returns one M.P. Pop. est. 38,400.

**Falkirk, BATTLES OF.** The first battle of Falkirk was fought, July 22, 1298, between the English and the Scots. Under Edward I the English invaded Scotland to crush the rebellion of William Wallace. The two armies met near Falkirk. The Scots, mostly pikemen, were ranged in four circular groups, each ring surrounded by stakes. Between the groups were bowmen and behind a few horsemen. The English knights were in three columns, their traditional formation, flanked and backed by archers. The first line charged, only to founder in a morass in front of the Scots; the second drove away the bowmen, but made no impression upon the pikes. Edward, therefore, called upon his archers, whose deadly aim soon broke the Scottish rings. The knights seized their advantage, and soon the Scots, greatly outnumbered, were either dead or in flight.

The second battle was fought between the English, under General Hawley, and the Jacobites, Jan. 17, 1746. Charles Edward, the Young Pretender, returning from Derby, found his way N. barred by the English. His Highlanders, in an impetuous charge, swept away the English troops, and Hawley lost 700 prisoners.

**Falkland.** Royal and mun. burgh of Fife, Scotland. It stands at the N. foot of East Lomond Hill, 36 miles by railway N. of Edinburgh. The chief attraction is its palace, formerly the residence of the dukes of Fife, in which David, the duke of Rothesay, heir to the Scottish throne, is said to have been starved to death at the instance of Albany, the regent, in 1402. The palace was a favourite residence of the Scottish monarchs; here James V sought refuge and died in 1542, and here Elizabeth (q.v.), daughter of James I, was born in 1596. Richard Cameron, founder of the Cameronians, was also a native. Rob Roy occupied the palace in 1715. It fell into decay, but was restored towards the end of the 19th century by the

Falkirk. Parish church which in 1811 replaced the "Speckled Kirk" built 1057-83

3rd marquess of Bute. Brewing and weaving are carried on in the town. Pop. 2,181.

**Falkland, LUCIUS CARY, 2ND VISCOUNT** (c. 1609-43). English royalist. He was the son of Sir

Lucius Cary, 2nd Viscount Falkland  
After Van Dyck

Henry Cary, a Devon man, who, after being lord deputy of Ireland, was made a Scottish peer as Lord Falkland in 1620. Lucius was educated at Trinity College, Dublin, and saw a little military service in the Netherlands. In 1633 he became Viscount Falkland, but by this time he had inherited from his grandfather, Sir Lawrence Tanfield, the estate of Great Tew, Oxon. His political career began in 1640 with his election as M.P. for Newport. He opposed the worse illegalities of the king, but was never a bitter partisan, and gradually, as the opposition to Charles hardened, he became more definitely on his side. In 1642 he was made a secretary of state. He was at Edgehill with Charles, but soon he fell into the melancholy described by Clarendon, seeing nothing but misery before his country. Expressing a wish to be "out of it ere night," he found the death he desired at Newbury, Sept. 20, 1643, when riding forward alone towards the foe.

Falkland is known mainly from the accounts given of him by his friend Clarendon, and these make him one of the most attractive men of his own or any age. He loved learning, and the society of scholars, who gathered in delightful freedom at his house; Chillingworth, Hales, Suckling, and Waller were among them. He wrote *A Discourse of Infallibility*. Of him Clarendon said, "Whosoever leads such a life need not care upon how short warning it be taken from him." The title passed to Falk-

land's eldest son, but his direct line died out in 1694. It then passed to Lucius (d. 1730), a descendant of the 1st viscount, the ancestor of the 13th viscount (Lucius Cary, b. 1880,) who succeeded 1922. Consult *Life and Times*, J. A. R. Marriott, 1907.

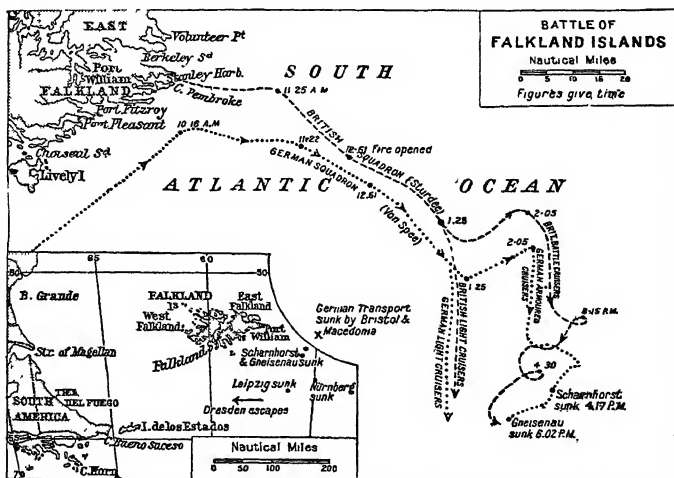

**Falkland Islands.** British crown colony in the S. Atlantic. The islands lie about 300 m. E. of the Strait of Magellan, and 1,000 m. S. of Montevideo. The group contains two large islands and about 100 small ones, with an estimated land area of about 4,618 sq. m., excluding S. Georgia, estimated at 1,000 sq. m. The chief are E. Falkland (2,580 sq. m.) and W. Falkland (2,038 sq. m.). The highest point is Mt. Adam (2,315 ft.) on W. Falkland. E. Falkland is hilly in the N., but low-lying, marshy, and boggy elsewhere. Trees are lacking, but grasses flourish; vegetables and green crops are cultivated. The coasts are much indented, affording good anchorage.

The chief industries are sheep-farming and whale fishing; horses and cattle are reared. Apart from the pastoral industry at the Falklands and the greatest whaling industry in the world carried on in the dependencies, there are few enterprises of commercial value. The exports are wool, whale products, and guano. At S. Georgia sealing is carried on. Stanley, the capital (pop. 1,246), is the only town; it is on E. Falkland, and possesses a good harbour. The climate in the Falklands, although bleak, is healthy. In the S. Orkneys, S. Shetlands, and Graham Land, the land is covered with

snow and glaciers, except in a few low-lying spots during the summer. The almost constant succession of strong winds, snowstorms, and fogs makes it a most inhospitable region. The only indigenous mammals are the fox and mouse, there being no traces of any aboriginal human inhabitants. Pop. of colony, including S. Georgia, est. 2,804.

The Falklands were discovered by John Davis in 1592, and taken by the French in 1764. The British recovered them three years later, but were ejected by the Spaniards, and it was not until 1832 that the group became British. Off these islands Sturdee won a naval victory over a German squadron, under von Spee, Dec. 8, 1914 (*v.i.*). After the entry of Japan into the Second Great War on Dec. 7, 1941, Imperial troops were sent to the Falkland Islands. The legislative council gave £50,000 to the imperial government for the purchase of aircraft, and introduced compulsory military service. For the diplomatic dispute of 1948 see in N.V. Argentina; Chile.

**Falkland Islands, BATTLE OF THE.** Naval engagement of the First Great War. It took place Dec. 8, 1914. The vessels engaged were on the one hand a German squadron under von Spee, consisting of the armoured cruisers *Scharnhorst* (flagship) and *Gneisenau*, the light cruisers *Nürnberg*, *Leipzig*, and *Dresden*, and three transports; on the British side, the battle cruisers *Invincible* and *Inflexible*, the armoured cruisers *Carnarvon*, *Cornwall*, and *Kent*, the light cruisers *Glasgow* and

Falkland Islands. Chart illustrating the course of the naval battle of Dec. 8, 1914. Inset, map showing position of the Falkland Islands relative to the mainland

Bristol, and two armed ships, all under Vice-Adm. Sturdee. The German squadron had recently destroyed two cruisers at Coronel (*q.v.*), and the two British battle cruisers were secretly dispatched to the Falklands to confront von Spee with overwhelming force.

The surprise was complete. While the British ships were coaling at Port William, von Spee, unaware of their presence, approached with the intention of seizing the naval base. On sighting the British battle cruisers (about 9.30 a.m.), the German squadron speedily turned about and set off E. at speed. At 10 the British ships put to sea in pursuit, with the Germans still in good view. The battle opened shortly before 1 p.m. The German light cruisers fled S., followed by the British cruisers. Sturdee engaged Scharnhorst and Gneisenau with the British battle cruisers in a running fight, going "all out" in a S.E. direction. Scharnhorst was sunk at 4.17 p.m. with no survivors. Gneisenau just before 6 p.m., with only 94 survivors. Leipzig and Nürnberg were sunk in separate actions. Dresden escaped for the time being, but the squadron as an active force was wiped out, the total German loss in men being 2,100. British losses were five killed and 16 wounded. Consult *The Official History of the Great War*, Vol. 1. Naval Operations, J. Corbett, 1920.

**Fall, THE.** Defection of the first human beings from a state of innocence. This is represented in the Eden story as an act of wilful disobedience, at the instigation of the serpent, to a command of God. As a consequence, Adam and Eve became conscious of guilt, and were expelled from the Garden of Eden. Theology teaches that the disobedience of our first parents had a threefold consequence in (1) a change of man's relation to God; (2) the loss of certain privileges connected with that relation; and (3) the beginning of a degenerative process which tended to make human nature more and more corrupt and alienated from God.

From this results the doctrine of original sin—that all men are born in a state of sin and are prone to wickedness as a result of Adam's fall. This may be viewed in two ways. Adam was the representative man and, with Eve, constituted the whole human family; so that the whole race fell in him. Or it may be viewed in connexion with theories of heredity, and sin be regarded as a mental

and moral tendency transmitted by natural generation. In any case, all orthodox theologians hold that original sin infected the race in all its individuals, and could be removed only by the act of God in Redemption through Christ.

In recent theological development there is a tendency to question the foundation on which the doctrine of original sin depends. This criticism rests on the following grounds: (1) the assumption that the human race started in a state of perfection is in conflict with the findings of modern anthropology and is difficult to reconcile with the doctrine of evolution; (2) the account of the Fall in Genesis does not contain the doctrine; (3) there is no definite trace of the doctrine in the rest of the O.T.; (4) the doctrine of original sin was the creation of the intermediate period between the O.T. and N.T., and first appears in Ecclesiasticus; (5) there is no hint of such a doctrine in the teaching of Jesus; (6) it is doubtful whether Paul accepted the full implication of the theory, though it must be admitted that there is one statement in his epistles (Rom. 5, v. 12) which seems to contain it; (7) the theory is difficult to reconcile with a true conception of Divine justice on the one side and human responsibility on the other. See *Sin*.

**Falla, MANUEL DE (1876–1946).** Spanish composer. He was born Nov. 23, 1876, and after studying in Madrid won the Spanish academy's prize for composition with an opera, *La Vida Breve*. During 1907–14 he lived in Paris, and then returned to Spain. His research on ancient folk-song influenced his own work, which developed an exclusively national manner. Ballets (*Love the Magician*, 1915, and *The Three-Cornered Hat*, 1919—the latter with choreography by Massine and settings by Picasso became a standard work of the Diaghilev company) were probably his most representative compositions. His other pieces included the impressionistic *Nights in the Gardens of Spain*, and *Pièces Espagnoles* for pianoforte. He died Nov. 14, 1946. Pron. *Fah-yah*. Consult *Manuel de Falla and Spanish Music*, J. B. Trend, 1930.

**Fallacy** (Lat. *fallax*, likely to deceive). An error in reasoning; a false argument that deceives or is intended to deceive. It may arise in the course of deduction or in the facts or observation on which reasoning is based. Thus, in the following argument, the

fallacy is obvious: Chimney-sweeps have black faces; that man has a black face; therefore he is a chimney-sweep. The fallacy is not so obvious in: We must keep out foreign goods, or our industries will be ruined. It took mankind thousands of years to appreciate the fallacy in the argument: As the sun rises in the east and sets in the west, it must revolve round the earth.

Particularly dangerous forms of fallacy are (a) "begging the question," or arguing in a circle, by assuming what has to be proved; (b) mistaking cause and effect; (c) thinking that because one event follows another, it must have been caused by it; (d) ambiguous use of words; (e) applying epithets, such as *disloyal*, *heretical*, *ridiculous*, to rebut statements. For a full classification of fallacies consult *System of Logic* (Book 5), J. S. Mill, 1843; *Elementary Lessons in Logic*, W. S. Jevons, 1870. See also *Syllogism*.

**Fallada, HANS (1893–1947).** A German novelist. His name was Wilhelm Friedrich Rudolf Ditzgen and he was born at Greifswald July 21, 1893. He won fame with a poignant study of post-war depression, *Kleiner Mann—was nun?* translated as *Little Man, What Now?* (1933). Other novels, all translated into English, are *Who once Eats out of the Tin Bowl*, 1934; *Once We Had a Child*, 1934; *Old Heart Goes A-Journeying*, 1936; *Wolf Among Wolves*, 1937; *Iron Gustav*, 1938. The juvenile element in Fallada's work was stimulated by the Nazi youth movement. A volume of fairy tales, *Hoppelpoppel, wo bist du?* was popular. Ditzgen, who lived on a farm in Mecklenburg during the Second Great War, died Feb. 6, 1947.

**Fallières, (CLÉMENT) ARMAND (1841–1931).** French statesman. Born at Mézin, Lot-et-Garonne,

Armand Fallières, French statesman

Nov. 6, 1841. He studied law in Paris, and became a barrister at Nérac, for which he was elected Republican deputy, 1876. He was under-secretary for the interior in Ferry's ministry, 1880, minister of the interior in 1882, 1887, 1889, of justice in 1887, of education 1883–1885, and president of the council in 1883. A senator in 1890, he was president of the senate 1899–1906.

He was elected president of France on Jan. 17, 1906, defeating Paul Doumer. Among the chief events of his term of office, which ended Jan. 7, 1913, were his visit to England in May, 1908, and the cementing of the Franco-Russian alliance. He died June 21, 1931. *Pron.* Fal-yair.

**Falling Leaf.** Evolution in aerobatics. The aircraft is made to start a spin in one direction, but just before the spin fully develops the controls are thrown over so that the machine is checked, pauses, and then side-slips over to start a spin in the opposite direction. The controls are again thrown over, reversing the spin once more, the evolution being repeated as often as the pilot desires. By alternating the spins the aircraft drops in the manner of a falling leaf.

**Falldon.** Seat in Northumberland, England, of Viscount Grey (1862-1933). It lies about 6 m. N. of Alnwick. From Falldon the statesman took part of his title; here he established a bird sanctuary; and here he died Sept. 7, 1933, leaving Falldon to his nephew, Sir Cecil Graves, joint director-gen. of the B.B.C., 1942-1943.

**Fallopian Tubes.** Two tubes, one on each side of the uterus or womb, which convey the ova or eggs from the ovary to the uterus. Each tube is about 4 ins. in length. The inner end opens into the uterus near its superior angle. The outer end opens into the peritoneal cavity, and terminates in an extremity in close relation to the ovary, and bearing a number of fimbriae or fringe-like processes which, by some mechanism not fully understood, attract and catch the ovum as it leaves the ovary.

**Fallopius** or **FALLOPIO**, GABRIELLO (1523-62). Italian physician and anatomist, discoverer of the functions of the Fallopian tubes (*v.s.*). Born at Modena, he studied medicine at Ferrara and other centres, becoming professor of anatomy at Ferrara. Afterwards he held the chairs of anatomy, surgery, and botany at Padua university, where he died Oct. 9, 1562. He published his *Observationes Anatomicae*, 1561, at Venice, where his works, *Opera Genuina Omnia*, were published in 1584.

**Fallow.** Term, derived probably from the Saxon *fealh*, a harrow, used to describe land that has been ploughed and harrowed but bearing no crop. The earliest rotation of crops was operated in the form of corn, fallow, since without cleaning it was impossible to

grow corn on land uninterruptedly year after year. Rotations persisted in this simple form until the introduction of more diversified crops such as turnips, swedes, and rotation grasses.

The beneficial effects of a fallow are biological, the ridding the land of weeds; physical, the improvement of the texture of the soil by the alternation of dryness and wetness; and chemical, arising from the accumulation of nitrates, and the liberation of mineral constituents such as phosphates and potash in a soluble form. Since the land is lost to cropping for a season when fallowed, the operation is an expensive one, and modern methods are designed to promote the cleanliness of land by cultivating crops which smother weed growth. In this category are rapes and kales, which are additionally valuable since they can be eaten off by stock, and thus not only keep weeds in check but enrich the soil, particularly when the stock receives concentrates in addition.

**Fallow Deer.** Small group of deer, which are characterised by having antlers round at the base and palmated above. They have small heads, rather large ears, and comparatively long tails, and usually stand about 3 ft. high. The hair is generally fawn colour, more or less dappled with white, but some local races lack the white spots, and are of such dark brown as to approach black. This is the deer generally kept in parks in Great Britain, and it occurs in a wild state in Epping Forest. It was probably introduced into Great Britain from the Mediterranean district at some early period. The huge extinct deer of Ireland, often erroneously called the Irish elk, was a gigantic species of fallow deer, and stood 6 ft. high at the shoulder, with antlers spanning over 11 ft. Its remains are also found in England and Scotland. *See* Deer; also Antler illus.

**Fall River.** City of Massachusetts, U.S.A. In Bristol co., it is a port of entry on Mount Hope Bay, 50 m. S.S.W. of Boston. It has an inter-urban electric rly. and a commodious harbour, with steamer connexion to New York and Philadelphia. Among the leading U.S. producers of cotton goods, it bleaches cloth and makes textile machinery, and also has oil refineries. Abundant water power is obtained from the Fall River and there is a hydro-electric plant on the Taunton. The first settlers received a grant from the Plymouth colony. Fall River was part

of Freetown until 1803, was called Troy until 1834, and received a city charter in 1854. Disastrous fires occurred in 1843 and 1928. Many French Canadians are among the pop. of 115,428.

**Falls, CYRIL BENTHAM** (b. 1888). British military historian. Educated at Bradfield college and London university, he served with distinction in the First Great War. During 1923-39 he held an appointment in the historical section (military branch) of the committee of imperial defence. One of his major works was the preparation of the official history of the land campaigns of 1914-18. He was appointed Chichele professor of the history of war at Oxford university in 1946. Falls, who was military correspondent to *The Times* from 1939 and a frequent broadcaster on the course of the Second Great War, published *The Nature of Modern Warfare*, 1941; *Ordeal by Battle*, 1943; *The Second Great War, a Short History*, 1948. He contributed to this *Encyclopedia* the article Europe, Western, Liberation of.

**Fallujah.** Town of Iraq, standing on the Euphrates, about 40 m. W. of Bagdad. During operations against the Iraqi rebels in 1941, their transport was bombed at Fallujah on May 5. British troops occupied the town on May 19.

**Falmouth.** Mun. bor., seaport, and market town of Cornwall, England. It stands at the mouth of the Fal, 11½ m. S. of Truro with a station on a branch rly. It is a port of call, and has an excellent harbour, accessible to the largest vessels. The dry docks have been

Falmouth arms

deepened by 4 ft., and pneumatic plant and electric welding apparatus installed, and large vessels can now put in for repairs. Ship-building, engineering, brewing, and rope-making are prominent industries, and there is a considerable pilchard fishery. Falmouth exports tin. Its equable climate, abundant sunshine, and the scenery of the Fal valley make it a favourite watering-place. Here are the headquarters of the Royal Cornwall Yacht Club, and all the usual holiday sports are catered for. The corporation maintains the markets, library, and pleasure grounds. Great improvements have been made along the sea front, a sub-tropical garden having been laid out and a concert pavilion erected.

Falmouth. The harbour of this Cornish seaport and market town at the mouth of the River Fal

On a peninsula S.E. of Falmouth Bay stands Pendennis Castle. Falmouth and Camborne elect an M.P. Market day, Sat. Pop. 15,500.

**False Acacia** (*Robinia pseud-acacia*) OR LOCUST-TREE. Tree of the family Leguminosae, native of N. America. It attains a height of 60–80 ft. Its long, narrow leaves are broken up into 5–12 pairs of oval leaflets, and at the base of the leafstalk are two stipules which, on the non-flowering branches, become hardened into persistent spines. The fragrant flowers are produced in long, pendent sprays, like those of the laburnum, but are white instead of yellow. The seed-pods, too, are like those of laburnum, but dark red in colour. The wood, though hard and durable, is liable to crack and is little used.

**False Antiquities.** Alleged relics of the human past forged, deliberately falsified, or erroneously attributed. The chief motives for their production are desire for gain and love of mystification. Production of copies of genuine originals (coins, scarabs, paintings, porcelain) with a fraudulent intention is on a different plane. To a special category should be referred such literary deceptions as Bertram's fabrication (see Bertram, Charles Julius). Among famous modern forgeries are those of Shapira, a Pole, who sold a collection of spurious Moabite pottery to the Prussian government for £3,000, and afterwards offered the British Museum an alleged Mosaic MS. on leather. The Louvre Museum, Paris, acquired, in 1896, for £8,000, a gold tiara inscribed to a Scythian king, Saitarpharnes, which was found in 1903 to have been produced in Odessa by a Russian workman. In 1908 scarabs recording the circumnavigation of Africa under Pharaoh Necho, led to a conviction for fraud. False prehistoric remains have fur-

nished the forger with a profitable field. Fifty years ago chipped flints were openly manufactured by Edward Simpson (Flint Jack). Meillet of Poitiers published grotesque Palaeolithic engravings in 1864.

Experts allow themselves sometimes by self-deception to attribute antiquity to

modern relics, as when W. Bode acquired for Berlin in 1909 a wax bust made by an English sculptor, Lucas, and claimed it as the work of Leonardo da Vinci. In 1947 a Dutch painter, H. van Meegeren, was imprisoned for passing off several of his own paintings as works by Vermeer. See Imposture; also Literary Forgery. Consult Archaeology and False Antiquities, R. Munro, 1905; Forged Egyptian Antiquities, T. G. Wakeling, 1912.

**False Bay.** Inlet of the Atlantic Ocean, on the E. side of the Cape of Good Hope. The Cape of Good

False Acacia. Flower of the locust-tree of North America

Hope and Hangklip Cape form the W. and E. extremities. Its length is 22 m. and its breadth 23 m. On the western shore is Simonstown (q.v.), a major naval base.

**False Point.** Cape and port of India. In the Cuttack district of Orissa, the cape is on the Mahanadi estuary, and is situated in 20° 20' N. and 86° 47' E. It is so called from being mistaken by seamen for Point Palmyras, 1° farther N. The port (opened 1860) has the best harbour, safe and completely landlocked, between Bombay and Calcutta, and there is canal communication with the interior of Orissa.

**False Pretences.** Term used in English law. It is a misdemeanour by statute to obtain or attempt to obtain money or property by false pretences. The pretence must be false; it must be a statement of fact and not merely of intention; the person making it must know it to be false; by it the other person must be induced to part with the money, etc., and it must be done with intent to defraud. The pretence may be made otherwise than by words—e.g. a man in an undergraduate's cap and gown enters a shop in Oxford and obtains goods on credit. He has represented himself to be an undergraduate of the university. Maximum punishment is penal servitude for five years, or imprisonment with or without hard labour for two years. Larceny by trick must be distinguished from false pretences. See Larceny.

**False Relation.** In harmony, one note following a different note of the same letter in another part, e.g. C sharp in alto followed by C natural in tenor, in successive chords. It is not permitted in strict harmony, but is condoned if, using the above example, both parts have C sharp in the first chord.

**Falsetto** (Ital.). Term applied to a kind of high voice of men, who discard the natural pitch of speaking and singing in order to cultivate extreme high notes and sing an alto part. It is produced, according to some, by allowing only a short length and a portion of the breadth of the vocal cords to vibrate, instead of the whole. There are a few natural adult alto voices, but most choir singers who adopt this part are baritones or tenors, using their falsetto range. See Voice.

**Falsification.** Term meaning making false. It is chiefly used in connexion with accounts. The falsification of accounts by a clerk or servant with intent to defraud is by English law a misdemeanour punishable by penal servitude. It is also an offence to falsify the service certificate of a seaman or soldier. Some forms of falsification come under the heading of forgery (q.v.).

**Falstaff**, SIR JOHN. Comic character of Shakespeare. He has the principal part in both the plays named after King Henry the Fourth, and in The Merry Wives of Windsor. In Henry IV (1) he is the companion of the prince who becomes Henry V, and leader of a crowd of rascals; in Henry IV, (2) though he dominates the action, he has only one scene with the prince and is finally rejected by him. Falstaff's death is related in King Henry the Fifth. The

Merry Wives of Windsor was written at the desire of Queen Elizabeth, who wished to see the fat knight in love; but the Falstaff here presented is a shadow of the original, who was assumed to have been modelled on Sir John Oldcastle (*q.v.*). For the wit which enables Falstaff triumphantly to carry off any situation, all his faults—cowardice, lying, drunkenness, grossness—are forgiven; he has “more flesh than another man, and therefore more frailty.” He emerges as the supreme comic creation in English literature; “I am not only witty in myself, but the cause that wit is in other men.” Notable interpreters of the part include Beerbohm Tree, George Robey, Robert Atkins, Ralph Richardson. Falstaff is the subject of operas by Verdi and Vaughan Williams (Sir John in Love) and a symphonic study by Elgar. Consult The Fortunes of Falstaff, J. Dover Wilson, 1943.

**Falster.** Island of Denmark. It lies to the S. of Zealand, between Moen on the E. and Maribo on the W., separated from them by narrow straits. It is 28 m. from N. to S., with a maximum width of 15 m. The surface is fairly level, but low and marshy near the coast, where malaria is endemic. The island is fertile and cultivated; stock-raising, dairy-farming, and agriculture are the principal occupations. Sugar-beet and fruit are the chief crops. The largest towns are Nykjøbing and Stubbekjøbing, connected by rly. Area 183 sq. m. Falster forms with Maribo a county. Pop. of island, 51,392.

**Falun.** This Swedish town is described under its alternative name Fahlun.

**Faluns** (Fr.). Series of loose, sandy shell-beds, of Miocene age. They occur in the Touraine area of the S.W. part of France. Of marine, shallow-water origin, they often contain numerous fossils.

**Fama Clamosa** (Lat., crying report). Term used in Scottish Church law for any public scandal against a minister with which the authorities find it necessary to deal. The charge must be maintained by some responsible person who is prepared to prove it, or it must be a matter of such notoriety that no special complainant is necessary.

**Famagusta** (Lat. *Fama Augusta*). Seaport of Cyprus. It stands on the E. coast, 3 m. S. of ancient Salamis. The cathedral of S. Nicolas and a castle are notable features of the town. The harbour improvements were finished in 1906, and a narrow gauge rly. con-

nects the town with Nicosia and Kalokhorio in the W. (71 m.). Agriculture is the chief occupation, and the town is noted for its pomegranates. The original Roman walls were strengthened by the Genoese and Venetians, and are still fairly well preserved. Here, in 1191, Guy de Lusignan (*q.v.*) was crowned king of Cyprus by Richard I. The town flourished under Venetian rule (1487–1571), but later was taken by the Turks, when its prosperity began to decline. An earthquake in 1735 destroyed it. Famagusta gives its name to an admin. dist. Pop. of town, 10,412.

Jews stopped while attempting to enter Palestine illegally were placed in a camp near Famagusta from Aug., 1946, and admitted gradually under the quota system until the British withdrew from Palestine, 1948. All who remained were admitted by Israel, the camp being cleared Feb. 10, 1949.

**Famatina.** Range of mts. in Argentina. An eastern portion of the Andes, in La Rioja prov. it rises to more than 20,000 ft. The town of Famatina is the headquarters of a mining region and is connected by rly. with Córdoba to the S.E.

**Famatinite.** Greyish copper mineral, copper antimony sulphide, often occurring intergrown with enargite, copper arsenic sulphide, in vein and replacement deposits; also associated with pyrite, tetrahedrite, chalcopyrite, barite, and quartz.

**Famennian.** Uppermost stage of the Devonian system of stratified rocks. It is well developed in Belgium and N. France, where it consists of fossiliferous shales and sandstones, and in Rhineland, where limestones also are developed. Beds of slate near Ashburton and the Petherwin beds near Dartmoor belong to this stage. The name is taken from the slates of Famenne (Belgium).

**Familiar** (Lat. *familiaris*). In the Roman Catholic Church, a person who belongs to the household of a pope or bishop. He must at least reside in the same diocese. The office became at one time an easy ladder to ordination and preferment. Consequently, the council of Trent decreed that a familiar could not be ordained by his bishop unless he belonged to the same diocese and had lived with him three years. Familiars of the Holy Office were officials of the Inquisition (*q.v.*) charged with the duty of arresting and imprisoning persons suspected of heresy or other offences against the spiritual authority. The name is explained

by reference to their admission into the confidence of the Holy Office, as members of the family.

Familiar was also the term applied to the spirit supposed to be in the service of necromancers and witches, incarnate sometimes in the form of a black cat or other animal. In this instance the idea was derived from the universal belief in a daemon, tutelary genius, or guardian angel associated with an individual from the moment of birth. See Demonology.

**Famille Jaune** (Fr.). Much of the finest old Chinese pottery is classified into family coloured groups, according to the predominating tints used. The most esteemed are the *famille rose*, *noire*, *jaune*, and *verte* (rose, black, yellow, green). See Pottery.

**Family** (Lat. *familia*). Group comprising father and mother, with their offspring. The unit of human society, its roots are traceable in the primeval life of mankind. The first attempt to elucidate the origin of family life was Maine's patriarchal theory (1861). Based on Roman models, it assumed that the primitive father possessed uncontrollable power, the *patria potestas*, over his household. This view was impugned by MacLennan (1865), who postulated a primeval promiscuity, out of which emerged matriarchy, attributed to uncertain paternity; and exogamy, due to the theoretic kinship of the maternal clan; while communal marriage ultimately broke up into polyandry and polygyny. Working on similar material Lewis Morgan (1870) observed that in primitive communities it was more customary to denote kinship by “classificatory” than by “descriptive” terms. The main classes were five in number, a man using the same words for all persons within the clan of the generations of his grandparents, parents, brothers, children, and grandchildren respectively. These systems were hailed as further evidence of a stage of communal marriage preceding the growth of family groups.

Westermarck (1891) reverted to Darwin's view (1871) that the family was from the beginning based upon the supremacy of the individual father. When the “matrimonial classes” of the Australian aborigines, based on the totem, were studied by Spencer and Gillen, Howitt, and others, they were held to point to a primitive form of group-marriage. Subsequently, Atkinson and Lang

(1903) suggested that the prohibition of marriage within an incest-group — whence exogamy sprang — was due to the jealousy of the sire. The theory of promiscuity is inconsistent with the evidence: the widespread variants of the normal family are explicable on other grounds.

In polygynous societies the family is composed of sub-families, which under the system of concubinage tend to become subordinate to that of the chief wife. The closer social relationship of the mother with her own children obscures the paternal status; one outcome of this is the toleration of union with the half-sister, e.g. Abraham and Sarah.

The matriarchal system, imposing rights and duties towards the child, first upon the kinship group, and afterwards, as their representative, upon the mother's brother, is a widespread social device for securing the observance of tribal law. It may be reasonably attributed to the beginnings of agriculture at the end of the Neolithic age, having been found in Europe by the Aryan-speaking peoples who spread westward, bringing new conceptions of father-right that lay at the base of patriarchal society. This view is confirmed by the matriarchy of early Egypt, and by the fact that patriarchy was well established at the dawn of Semitic history, which antedated the Aryan family.

In aboriginal America, where social organizations were developed on the neolithic foundation brought from Eurasia, the family — in the sense of the household or "house-fire" — is traceable at every cultural level. See Kinship; Marriage; Society.

**Family.** In classification of plants and animals, a group of genera which resemble one another but are not marked by such important distinctive features as to justify making them into an order. For example, the domestic dog belongs to the genus *Canis*, which, with three other living and several extinct genera, is included in the family Canidae, or dog-like mammals; this family forms a group of the order Carnivora. See Classification, table, pp. 2136-37.

**Family Allowances.** Term used for state assistance to families with children. France, in 1913, and Germany, in 1936, introduced such allowances, with the object of raising the birth rate. In the British Commonwealth they have found a place in social security schemes. Australia, under the

Child Endowment Act, effective July 1, 1941, made an allowance of 10s. a week for each child under 16 after the first; New Zealand from April 1, 1946, allowed 10s. a week for each child under 16; Canada by an Act of 1944, effective July 1, 1945, gave \$3 to \$8 a month for each child under 16 for families with less than \$1,200 a year.

In the U.K. an Act of June 15, 1945, effective Aug. 6, 1946, provided for an allowance of 5s. a week for each child after the first until July 31 following the 16th birthday of a child continuing full-time education. The ministry of national insurance administers the Act; payments are drawn at post offices. Where husband and wife live together, or a wife separated from her husband has the children, the allowance belongs to the wife. At the beginning of 1949 there were 2,900,000 families drawing allowances for 4,600,000 children. *Consult* Family Allowances, E Rathbone, new ed. 1949.

**Family Compact.** Arrangements made in the 18th century between the kings of France and Spain for the maintenance of an alliance between them, the Bourbons being the family then ruling over both countries. On Nov. 7, 1733, France and Spain signed a secret treaty directed against Austria, with whom war quickly followed. In Oct., 1743, this alliance was renewed in a new family compact, directed mainly against Great Britain, with whom Spain, but not France, was then at war. War between French and British quickly followed. A third was made in 1761, when the Seven Years' War was raging. By this Spain entered the war.

The term family compact was applied to the domination of Upper Canada, or Ontario, by a narrow circle of men, attached to England and the English church, in the early 19th century.

**Family of Love** or **FAMILISTS.** Religious sect, founded by Henry Nicolaes, or Nicholas (c. 1502-80). Influenced by the mystical teachings of David Joris (1501-56), he claimed to be a recipient of divine revelations. The sect made its way to England in the reign of Edward VI, and had a few scattered followers. They taught that no one outside their sect could have a true knowledge of God; gave all the chief doctrines of Christianity a purely allegorical interpretation; and were extreme antinomians in practice as well as in theory. They became extinct about the middle of the 17th century.

### Family Welfare Association.

Formed in London in 1869 as The Society for Organising Charitable Relief and Suppressing Mendicancy. This name was later changed to Charity Organisation Society, and on Feb. 1, 1946, to Family Welfare Association. The chief work of the association is the development of family case work, which is the art of helping people in trouble to make the best use of their own capacities, with the cooperation of their family and the community, to overcome difficulties. It also seeks to unite in common action all persons and agencies engaged in family case work and to encourage developments necessary to meet new social needs. It takes an active part in social research and in practical schemes for raising the standard of living. Its London district committees maintain centres for social service representative of the life and work of the district. The offices are at Denison House, 296, Vauxhall Bridge Road, London, S.W.1.

**Famine** (Lat. *fames*, hunger). Period of want or scarcity of food supplies, usually confined to a more or less restricted locality. Its chief primary cause is deficiency of rainfall, but floods, frosts, storms, visitations of insects or other pests, inadequate agricultural methods, ill-directed labour, deficient transport, and the ravages of war are contributory causes. Neglect in the storage of food frequently brings about famine among primitive peoples, but it is sometimes to be accounted for by less obvious reasons, such as wholesale deforestation, which gives rise to local conditions of drought, and the dependence of a group upon one kind of food, as maize in S. America, rice in China, or the potato in Ireland.

Although scarcity is only partially preventable, the careful organization and governmental supervision of agricultural production in most parts of Europe and America have virtually freed civilization from the dread of starvation in normal circumstances. But all the foresight and accumulated experience of man is by no means equal to combating the conditions of serious dearth which follow prolonged hostilities. During and after both the Great Wars famine, or near famine, spread widely throughout Europe, especially in Russia, Germany, Austria, the Balkans, Czechoslovakia, and certain parts of France and Belgium.

The greatest recorded famines occurred at a fairly early period in

history, when the world was entirely dependent upon local and circumscribed supplies. In 439 B.C. Rome was visited by a famine so severe that thousands cast themselves into the Tiber. In Egypt famine lasted A.D. 1067-72, while in 1005 Saxon England, and eleven years later the whole of Europe, experienced a prolonged period of terrible dearth. Another great European famine occurred in 1162, driving the population in many countries to cannibalism and to brigandage. Ireland has frequently suffered from periods of scarcity, especially severe visitations occurring in 1491, 1822, and from 1846 to 1847, when the potato crop failed with consequences of the most disastrous kind, thousands perishing from the "famine fever" which followed. In the period of dearth which followed the Thirty Years' War in Germany multitudes perished from hunger.

One of the most disastrous famines in modern Europe was in Russia in 1921. At the height of the shortage caused by agricultural disruption following the revolution, a quarter of the Russian people were on the verge of starvation. An American relief administration expended £12,000,000 in providing and distributing 800,000 tons of food amongst 10,500,000 people.

N. China suffered widespread famine in 1877-78 and in 1920. In India a million persons died of starvation in the famine of 1866 and

1½ millions in 1869, and the famine of 1899-1900 cost a million lives. A famine in Bengal in 1943, resulting from the failure of the Indian rice crop and the absence of supplies from Japanese-occupied countries, caused the death from starvation and the resultant cholera epidemic of an estimated 1,500,000 persons.

**Fāmūd** or **FAEMUND**. Lake of Norway, in Hedmark co., near the Swedish border. It lies in a mountainous district, at an alt. of 2,199 ft., 85 m. S.S.E. of Trondhjem. It is 37 m. long from N. to S., with a maximum width of 5 m.

**Fan** (Lat. *vannus*). Implement for agitating the air, especially used for cooling the face. Fans have been used from the earliest ages in hot countries, and in their primitive form they were made of feathers stuck into long handles. In Europe they came into general use in the 16th century, and were known as early as the 14th century, having probably been introduced from the East. They were usually made of feathers, straw, silk, etc., with handles of ivory, gold, silver, and wood, often richly carved and encrusted with precious stones.

The folding fan, an invention of the Japanese, was adopted in Europe towards the end of the 16th century. Fan painting became an art in the middle of the 17th century, and printed fans, illustrating pastoral scenes, and reference to politics, etc., also became the

vogue. Fans have always played a symbolic part in ceremonial, and even now are used in the East, and are carried on state occasions in papal processions in Rome. See Punkah: consult also Fans and Fan Leaves, collected and described by Lady C. Schreiber (English), 1888 and (Foreign) 1890; History of the Fan, G. W. Rhead, 1910.

**FAN PAINTING**. Both folding and non-folding fans have been the object of elaborate decoration. Antoine Watteau, Nicolas Lancret, Jean Baptiste, Joseph Pater, François Boucher, and other 18th century French artists produced fans of incomparable beauty. Among English artists who have practised the art the most notable was Charles Conder (1868-1903), who in this genre was no mean rival of Watteau himself.

**Fan**. Mechanical appliance for moving air or other gas. There are two main types: the propeller fan, resembling in shape and principle a screw propeller; and the centrifugal fan. Fans are used to move air for ventilation purposes (e.g. the small portable electric fan which sets up a current of air within a room); or (extractor fans) to withdraw used air from a public building. These duties are performed by propeller type fans when little resistance to the flow of air from them is likely, since this kind of fan mainly speeds up the flow of air and does not greatly increase its pressure.

Fan. Examples of delicate and artistic work. 1. Richly painted gilt fan, decorated in Vernis Martin lacquer, period of Louis XIV, formerly belonging to Queen Victoria. 2. Silk fan with medallions painted by F. Boucher (1708-70). The ivory stick is carved and enriched with gold. 3. English fan made to commemorate the recovery from illness of George III in 1789, now in the British Museum. 4. White lace fan mounted on mother-of-pearl, formerly belonging to the Empress Eugénie

Fan. Standard centrifugal ventilating fan and, right, sectional diagram.  
A, fan-wheel; B, air-inlet; C, casing; course of air indicated by arrows

Centrifuga fans are installed when there is considerable resistance to be overcome (*e.g.* when the ventilating system includes lengths of duct or trunking, through which the air must be forced on its way to or from a building). Whereas in a propeller

Fanar, the Turkish name for that quarter of Constantinople which was inhabited by Greek residents. Members of this class, by means of a recognized system of bribery, obtained nomination as rulers of principalities such as Wallachia, and set themselves to recoup their expenses by unscrupulous taxation. The system of appointing fanariotes was dropped in 1821.

**Fancy.** Shortened form of phantasy. It means primarily any creation of the imagination. From this it came to be used for an inclination or liking, and thus we speak of fancying anything, and have the phrase bird fancier. The fancy is sometimes a term for followers of pugilism, while De Quincey uses it for lovers of rare books. Fancy goods as a trade term refers to the lighter and supplementary forms of women's dress, such as ribbons, gloves, veilings, etc., also to handbags and articles used to ornament rooms, such as silver vases, picture frames, and the like and to various "gadgets" suitable for presents.

**Fandango.** Spanish dance. It is usually accompanied by castanets to reinforce the strong rhythm, as well as by melodic instruments. It is danced by two people to triple time. A characteristic rhythm of the music is:

See Castanets.

**Fanfare (Fr.) OR FLOURISH.** Properly, a short passage for trumpets in unison, performed on state occasions. That used at the opening of parliament dates from the reign of Charles II. Some com-

Fanfare sounded by state trumpeters

Fan. Side view of propeller fan, which moves air in a direction parallel to its spindle axis

type fan the air is discharged in a direction parallel to the axis or spindle of the fan, in the centrifugal fan the air is drawn in axially at the centre and discharged at the periphery. The blades are curved and are enclosed in a casing of volute shape. In mechanical ventilation systems the spent air is usually removed by extraction, so inducing a flow of fresh air from outside through the many apertures at doors and windows. Fans are also used to force air into rooms, or to provide a forced draught to a furnace. See Boiler; Draught; Ventilation.

**Fanariotes OR PHANARIOTES.** Name given to the aristocratic Greek class in Constantinople (Istanbul) prominent during the 18th century as governors of the E. European provinces of the Porte. The word is derived from

posers have used fanfares in opera, notably Beethoven. Spontini, Ambroise Thomas, and Wagner.

**Fang.** A specialised tooth in poisonous snakes by which the venom is conveyed into the wound caused by the bite. In the viper tribe the fangs are channelled, so that the venom, exuding from the tip of the tooth, is conveyed to the deepest part of the wound. In certain other snakes the fang is simply grooved, and most of the venom merely reaches the surface. The fangs may be either at the front of the jaw or at the back; with the latter arrangement the bite is seldom dangerous to man, though it may be fatal to small animals. The fangs usually fold back against the jaw when not in use. The venom is forced through the fang partly by constriction of the venom bag, partly by pressure on the base of the fang in the act of biting.

**Fang OR PANGWE.** Negro tribe of the French Gabon colony and Spanish Guinea. Their debased Bantu speech, including the Maké dialect, is spoken within the coast-highland region bounded by the Ogowe, Ivindo, and Campos rivers. Well-built, slim, 5 ft. 7 ins. in height, bronze-coloured, bearded, intelligent, they display Hamitic elements, having migrated due W. from the valleys of the N. Congo affluents about 1850, driving the weaker aboriginal negroes before them. They are hunters and fishers, using cross-bows and throwing-knives, and are adept potters and ironworkers. The men wear bark waistcloths, the women grass girdles.

**Fanmakers' Company.** London city livery company, incorporated on April 19, 1709. Its offices are situated at 23a, Lime Street, London, E.C.3.

**Fannich.** Loch in the centre of Ross and Cromarty, Scotland. The loch is 6½ m.

E.-W., and 1 m. N.-S., and is drained by Fannich Water, 6½ m. long. The Fannich Mts. (highest peak Sgurr Mor, 3,637 ft.) and Fannich Forest (20,000 acres) lie to the N. of the loch. Under the

Fanmakers' Company arms

North of Scotland Hydro-Electric Board construction scheme, work commenced in 1946 to utilise Loch Fannich as a reservoir to feed a power station at Grudie Bridge in Strath Bran.

**Fanning.** A coral island in the Pacific Ocean, lying due S. of the Hawaiian Islands in lat. 3° 50' N. and long. 159° 20' W. Administratively it is annexed to the Gilbert and Ellice Islands Colony, and is a station of the submarine cable between Australia and Vancouver. It exports mother-of-pearl, and there are guano deposits. Area, 15 sq. m. Pop. 255. The name is also applied to a neighbouring group, viz. Christmas, Jarvis, Washington, and Palmyra, the last being claimed by the U.S.A. The total land area is about 260 sq. m. They were discovered in 1798 by Edmund Fanning.

**Fanning, EDMUND (1737-1818).** American soldier. Born at Long Island, New York, he graduated at Yale in 1757. He became a lawyer in N. Carolina, and occupied various posts in the local government, where his malpractices and subservience to the home government earned for him unpopularity. In 1774 he was made surveyor-general, and in 1777 he raised a regiment to combat the revolution. Colonel in the British army in 1782 and governor of Prince Edward Island in 1787, he became major-general in 1794 and general in 1808. In those years he did some voyaging in the Pacific. He died in London, Feb. 28, 1818.

**Fanning, JOHN THOMAS (1837-1911).** American engineer. Born at Norwich, Conn., he was there educated. He became an engineer, but left his profession to serve the North in the Civil War. He was for nearly fifty years one of the leading authorities on hydraulics, being concerned in the construction of numerous waterworks and similar undertakings in the U.S.A. He was chief engineer of the water-power company at St. Anthony Falls. His *Treatise on Hydraulic and Water Supply Engineering*, 1877, was long the best American book on the subject.

**Fannius, GAIUS (fl. 2nd century B.C.).** Roman annalist. He served in Africa, where he and Tiberius Gracchus were the first to mount the walls of Carthage 146 B.C., and in Spain 142. Through the influence of Gaius Gracchus he obtained the consulship 122, but when the former proposed to confer full citizenship upon the Latins, Fannius opposed him in a famous speech. Orator, advocate,

and student of philosophy, Fannius was best known for his *Annales*, a history of Rome from the earliest days down to his own times. The work enjoyed a high reputation, and was used by Plutarch in his *Lives of the Gracchi*.

**Fanö.** Island of Denmark. It lies off the S.W. coast of Jutland, and its N.E. point faces Esbjerg on the mainland. It is 11 m. long and from 2 m. to 3 m. broad. There are three small towns on the island: Fanö, a health resort on the W. coast; Nordby, on the N.E. coast; and Sønderho, in the S. Fishing is the main industry. Area, 20 sq. m.

**Fano** (anc. *Fanum Fortunae*). Port and seaside resort of Italy, in the prov. of Pesaro. It stands on the Adriatic, 8 m. by rly. S.E. of Pesaro. It is mainly enclosed by medieval walls, with the bastions facing the sea. Its cathedral and churches contained many pictures by old masters. Nearly all these buildings were mined and heavily damaged by the Germans in the Second Great War, during which Fano was taken by Polish troops of the 5th army, Aug. 27, 1944. The town possessed a fine theatre, formerly a palace, the remains of a triumphal arch of Augustus, and a palace of the Malatesta. Fishing is the chief occupation of the inhabitants, and there is trade in corn, oil, and silk. The old harbour has silted up, and shipping is now conducted through a canal to the sea. Here, in 1514, the first printing press with Arabic type was set up. The Roman city owed its origin to a temple of Fortune commemorating the defeat of Hasdrubal on the Metaurus. Pop. 26,928.

**Fan-palm** (*Livistona*). Genus of trees of the family Palmae. They have very large, fan-shaped,

Fan-palm. Leaves of *Livistona chinensis*, a species from S. China

plaited leaves, and are natives of Eastern Asia, Malaya, and Australasia. The best-known species are *L. australis*, from Eastern Australia, and *L. chinensis*, from S. China.

**Fanshawe, SIR RICHARD (1608-66).** English diplomatist and writer. Born at Ware Park, Herts, he was

Sir R. Fanshawe, English diplomatist after Harding

appointed in 1635 secretary to the embassy at Madrid. About 1644 he became secretary to the prince of Wales, and in 1648 was made treasurer of the navy under Prince Rupert. He was created a baronet in 1650. After the Restoration he sat in Parliament for Cambridge university from 1661 until his death, and undertook various missions to Spain and Portugal. He translated the *Lusiads* of Camoens (in captivity after the battle of Worcester), 1655; and Guarini's *Pastor Fido*, 1647. He died June 26, 1666.

**Fantaisistes.** Group of French writers who, in reaction against symbolism and romanticism, continued the traditional vein of Gallic irony, deriving inspiration from Villon and from the *grotesques*, especially La Fontaine. Accomplished craftsmen, they eschewed the laxities of the modernists. Théodore de Banville and later Jules Laforgue and Paul Jean Toulet were forerunners of *fantaisisme*, and the most important figures in the group were Tristan Derème (b. 1889), Tristan Klingsor (b. 1874), Jean Marc Bernard (1881-1915), the Belgian Théo Varlet (1878-1938), Jean Pellern (1885-1920), and Léon Véra (b. 1885). Francis Carco (b. 1886) and Pierre MacOrlan (b. 1883) turned from poetry to the writing of realistic fiction.

**Fan Tan.** A Chinese gambling game. The implements for playing consist of a bowl full of beans or counters and an oblong card, placed on a table, the corners of which are numbered, or assumed to be numbered, from 1 to 4: the lower right hand corner being 1, the top right hand corner 2, the top and bottom left hand corners 3 and 4 respectively. Or in place of the card a corresponding oblong space is chalked upon the table. Bets are made upon these separate corners, which are decided by the banker taking a handful of beans or counters, and dividing them into fours; the number of odd pieces over deciding the winning number. If there is no remainder, No. 4 wins.

An American variety is played with an ordinary full pack of cards, by any number of players up to eight. One card is dealt to each player, the remainder forming

the stock and being placed face downwards upon the table. Each player contributes a fixed stake. Unless an ace has been dealt to him, each player draws a card from the stock in rotation until he obtains an ace; each time he fails to do so, paying an ante or stake, which continues until all four are drawn by one or other of the players. The aces are laid side by side as they are turned up, and the different suits are built upon them, from ace to king. The player who first gets rid of all his cards takes the pool. See Gaming.

**Fantasia** (Ital.). Musical composition in which strict form is not exacted, and everything is left to the "phantasy" of the composer. In different centuries and countries, this term and similar ones—fancy, fantasie, rhapsody, phantasy, etc.—have denoted greatly varying types of music, but all possessing the idea of freedom from the more formal designs of their periods and surroundings. These terms have covered alike the naïve old contrapuntal string trios of Orlando Gibbons (early 17th cent.), the monumental organ fantasias of J. S. Bach (early 18th cent.), and much worthless pianoforte music of the 19th century.

**Fantasia.** Film by Walt Disney, made in Hollywood, U.S.A., and shown in the U.K. in 1941. The artist's aim was to depict in coloured cartoons the stories, patterns, etc., suggested by listening to eight pieces of classical music: Bach's toccata and fugue in D minor, Tchaikovsky's Nutcracker suite, Dukas's Sorcerer's Apprentice, Stravinsky's Rite of Spring, Beethoven's sixth symphony, Ponchielli's Dance of the Hours, Moussorgsky's Night on the Bare Mountain, and Schubert's Ave Maria. The orchestra was conducted by Leopold Stokowski, and Deems Taylor spoke a commentary. Disney's imaginative powers were fully extended in creating themes which ranged from abstract design and fairylike beauty to broad comedy.

**Fantastic Symphony.** Composition by Berlioz (Op. 14). It has for sub-title *Épisode de la Vie d'un Artiste*, and is a notable example of telling a story in music. This story concerns a young musician who, having tried to poison himself with opium, is thrown into a highly nervous condition; his sensations and memories find utterance in the form of musical imagery. The image of the beloved recurs in idealised, then distorted form throughout

the five movements: Introduction, Un Bal, Scène aux Champs, Marche au Supplice, and Songe d'une Nuit de Sabbat. Reputed to have been inspired by Henrietta Smithson, the symphony was first played in Paris in 1832. It was performed as a ballet (with choreography by Massine) by the de Basil company at Covent Garden in 1936.

**Fanti** (cabbage-eaters). Negro people in the Gold Coast colony, W. Africa. They are allied to the Ashanti (*q.v.*), and their number is estimated at 1,000,000. They are muscular, round-headed, chocolate-hued, of medium stature, and live in small village-communities, and on the coast. Their tribal scars are three lines on each side of the jaw-bone. Their Tshi dialect is the dominant speech round Cape Coast Castle. Ceremonial cannibalism formerly prevailed among them.

**Fantin-Latour**, IGNACE HENRI JEAN THÉODORE (1836–1904). A French painter. Born at Grenoble, Jan. 14, 1836, he went to Paris to study at the Petit École. As a result of exhibiting three portraits in 1859 he became acquainted with Manet (whose portrait he painted), but remained uninfluenced by the new

school. He combined realistic technique with the vision of a poet, and imbued his portraits with great fidelity. Many were of his friends, among them Baudelaire, Verlaine, Rimbaud, Whistler, grouped in such pictures as *Homage to Delacroix*, *The Corner of the Table*, *The Dubourg Family* (Louvre), and Mr. and Mrs. Edwards (National Gallery). Fantin-Latour was known as a great painter of flowers before his genius in portraiture was fully revealed. His cool, delicate colour and precision of construction are remarkable. A study of roses by him is in the National Gallery. The British Museum has a collection of his lithographs. He died at Bure, Orne, Aug. 28, 1904. A study of his art by F. Gibson appeared in 1924.

Fantin-Latour,  
French painter.  
Self-portrait in Uffizi  
Gallery, Florence

**Fan-Tracery.** In Perpendicular Gothic architecture, the rich tracery of a vault created by springing the stone ribs from their various points of support in such fashion that the effect is that of a spreading fan. There are finely developed examples in Henry VII's Chapel, Westminster Abbey, in St. Stephen's cloister at Westminster Hall, and in St. George's Chapel, Windsor. See Gothic Architecture.

Fan-Tracery seen in the vaulting of Henry VII's Chapel, Westminster Abbey, begun in 1503

**Farad.** The practical unit of electrical capacity, or capacitance. A condenser is said to have a capacity of 1 farad when a charge of 1 coulomb raises the potential difference between its plates by 1 volt. The farad being an excessively large unit for practical purposes—the capacitance of the earth itself is only about 1/1400 farad—the practical unit of  $10^{-6}$  farad, i.e. the micro-farad ( $\mu\text{F}$ ) is normally used. An even smaller unit, the micro-micro-farad ( $\mu\mu\text{F}$ ), or pico-farad, equal to  $10^{-12}$  farad, is the order of capacitance which is common to radio-frequency circuits. See Capacity.

**Faraday**, MICHAEL (1791–1867). British chemist and physicist. The son of a blacksmith, he was born at Newington Butts, London, Sept. 22, 1791. After a short apprenticeship with a book-binder, he became laboratory assistant to Sir Humphry Davy at the Royal Institution. There he quickly showed remarkable ability as an acute observer and original experimenter. In 1813–15 he travelled with Davy in Europe; ten years later he became director of the laboratory; and in 1833 Fullerenian professor of the Institution for life.

Faraday stands at the head of scientific observers of the 19th century, and his discoveries have left their indelible mark on the progress of mankind. Today his pointers to the paths of investigation in electricity are still being followed, and results are being obtained in accordance with his brilliant predictions. Faraday's

Michael Faraday,  
British physicist

earliest work under Davy was concerned with chlorine, two new combinations of which he discovered. He followed this up with the liquefaction of a number of gases, and the discovery of new kinds of optical glass. The later discovery was destined to lead to one of his most important investigations in electricity, that of magnetic rotatory polarisation in 1846.

Ten years of experimenting led Faraday on Aug. 29, 1831, to the greatest of his discoveries—the induction of electric currents. A disk of copper rotated between the poles of a horseshoe magnet; two rubbing contacts closed the circuit; and a galvanometer registered the continuous current. In 1833 he proved the identity of electricity from different sources; in 1834 came the discovery of equivalents in electro-chemical decomposition; in 1838 electrostatic induction, followed by the announcement of the relation between electric and magnetic forces. These results were given to the world in Nov., 1841, when Faraday read his first lecture on experimental researches to the Royal Society.

His second great period of discovery began in 1845 when he returned to the problem of the effect of a magnetic or electric field on transparent bodies. He soon announced the magnetisation of light and the theory of diamagnetism. This was the end of his original work, but he continued to publish *Experimental Researches in Electricity* up to 1855; *Experimental Researches in Chemistry and Physics* appeared in 1859.

In 1835 Faraday was given a pension, and in 1858 a house at Hampton Court, where he died Aug. 25, 1867. Deeply religious, a member of the sect known as the Sandemanians, Faraday rigidly separated his religion from his science. In the latter, he was one of the most brilliant experimenters ever known, and to him must be given the credit for the solid foundation of electrical science as it is known today.

**Bibliography.** The standard Life is by John Tyndall, 5th ed. 1894. Other Lives are by Bence Jones, 1870; J. H. Gladstone, 1872; S. P. Thompson, 1898; W. L. Randall, 1924; E. W. Ashcroft, 1931; T. Martin, 1935. A Tribute to Michael Faraday, R. Appleyard, 1931. Diary, ed. T. Martin, 4 vols., 1932–33.

**Faraday Building.** Post office building in Queen Victoria St., London. Completed in May, 1933, and named after Michael Faraday, it

houses the London trunk telephone exchange, the toll exchange, the continental telephone exchange, and the overseas radio telephone exchange. Each year it handles 55,000,000 London and provincial toll calls; 1,300,000 continental calls; and over 100,000 overseas radio telephone calls. The four exchanges employ 3,500 operators and a staff of 600 engineers. During the Second Great War, Faraday Building twice received direct hits from bombs and was several times damaged by blast, but at no time were communications interrupted.

**Faraday's Laws.** These laws of electrolysis discovered by Michael Faraday are as follows: (1) In an electrolytic cell the amount of an ion liberated or deposited at an electrode is proportional to the quantity of electricity (*i.e.* electric current  $\times$  time) which has passed in a given time; and (2) the masses of substances liberated or deposited by the same quantity of electricity are proportional to their chemical equivalents. These quantitative laws permit of the measurement of the average electric current flowing in a given time through a circuit containing an electrolyte. See *Current*; *Electrolysis*.

**Faraday Society.** Founded in 1903, to promote the study of electrochemistry, electrometallurgy, chemical physics, metallography, and kindred subjects. Among its presidents have been Sir Joseph Swan, Sir Robert Hadfield, and Sir Robert Robertson. The offices are at 6, Gray's Inn Square, London, W.C.1.

**Faradism.** Term used in electrotherapeutics describing an interrupted current of electricity. Faradism is helpful in diagnosing the nature and extent of paralysis and in the treatment of many muscular conditions.

**Farce** (Fr. from Lat. *farcire*, to stuff). Dramatic piece of an essentially ridiculous character to which extravagant language, caricature, and ludicrous situations may all contribute. The modern farce is more closely connected with the ludicrous element that came to be grafted on to early morality plays, and in time came to be given in separate performances. In its modern sense it has been succinctly defined as the briefer sort of comic play in which a more unrestricted licence of fun is allowed, and a stronger demand made upon the sense of probability. A critic has also said that whereas characters in comedy are larger

than life, farce deals with real people in unreal situations.

Modern farce may be said to have started with the plays of Samuel Foote, in the 18th century. In the 19th century the short farcical play as written by Poole, Maddison Morton, F. C. Burnand, and others was highly popular. A series of farces by Ben Travers, at the Aldwych Theatre, 1925–33, provided some of the best examples in the 20th century. The word originally meant an interpolation, like an actor's gag, hence a performance in which jests and humorous incidents predominated.

**Farcy** (Lat. *farcinium*). Disease affecting horses. It is a form of glanders (*q.v.*), and as such must be notified to the local authorities.

**Far East.** Term loosely applied to cover the countries of eastern Asia: Siam, Indo-China, China, Manchuria, Siberia, Japan, Malaya, and the East Indies.

**Far Eastern Region.** Asiatic territory of the R.S.F.S.R. This region of Siberia has an area of 900,731, sq. m. and extends from Vladivostok on the Pacific to the Bering straits, being bounded on the N. by the Arctic Ocean. The territory is rich in fur-bearing animals; timber constitutes one of its most important natural resources; and there are minerals and fisheries. In the Kamchatka area agriculture and cattle breeding have been developed, and there are three large state farms. Khabarovsk (pop. 199,364) is the principal city. The territory has a pop. of 1,593,400.

**Fareham.** Market town, seaport, and urban dist. of Hampshire, England. It stands on a creek off Portsmouth Harbour, 8 m. N.W. of Portsmouth and 76 m. S.W. of London, and is a railway junction. The chief building is S. Mary's Church, and near are the ruins of Porchester Castle. There is a trade in corn and coal. In medieval times Fareham was a prosperous port, but now it can be reached only by small vessels. Once a borough and a parliamentary division, it now shares an M.P. with Gosport. Market day, Mon. Pop. urb. dist. 40,000.

**Farewell.** Cape of Greenland, at its southernmost point, in lat. 59° 50' N. It is on a small island off the coast, with an alt. of 1,000 ft. The ice drifting past it from the N.E. towards Davis Strait, in addition to the currents, makes it dangerous for navigators.

**Far from the Madding Crowd.** Novel by Thomas Hardy, published 1874, one of his earliest

tales of rustic Wessex life. The central character is a woman farmer, Bathsheba Everdene, and the story tells of her tragic relations with three men. Gabriel Oak, in whose love she finds final repose, is a superb portrayal of fine and consistent loyalty.

**Fargo.** A city of N. Dakota, U.S.A., the co. seat of Cass co. The largest city in the state, it stands on the Red River of the North at the head of steamship navigation, 250 m. N.W. of Minneapolis, and is served by rlys. and an airport. Fargo and the surrounding area rest on the bed of the glacial Lake Agassiz, which is among the world's best wheat lands. Sweet clover has become an important crop here. Fargo is a distributing point for farm machinery and cars. It has meat packing plants and manufactures glass, wood, and steel products. Here is the state agricultural college. The town was settled in 1871 and incorporated four years later. Nearly half the pop. of 32,580 claims Norwegian descent.

**Farida** (b. 1920). Former queen of Farouk I of Egypt. Daughter of Youssuf Zulfikar, a judge, and granddaughter of Said Mohammed, former prime minister, she married the King Jan. 20, 1938. He announced his divorce of her as from Nov. 17, 1948.

**Faridkot.** Former state of India, now part of the Patiala and E. Punjab Union. In the S. of Ferozepore district, its area is 643 sq. m. The ruling family belonged to the Sidhu-Barar clan of the Jats, and was founded in the 16th century. Pop. 199,282.

**Faridpur.** District and town of E. Bengal, Pakistan, in Dacca division. The name is derived from a Mahomedan saint, Farid Shah, whose shrine has been set up in the town. The latter is on the right bank of the Ganges and is connected by rly. with Calcutta. Of the total area of the district, 2,821 sq. m., more than three-quarters is under cultivation. This swampy district grows much rice. Other crops are jute, which is the chief export, and pulses. Hand weaving is the principal industry. Pop. dist., 2,888,803; town, 17,450.

**Faridun.** Hero of Persian mythology. His story is told in the Shâh-Nâmeh of Firdusi (Eng. trans. A. Rogers, 1907). Faridun overcomes the dragon tyrant Zuhak and occupies the throne. He is said to have reigned justly for 500 years, and to have gone about the world doing good and planting cypresses and roses.

**Farina** (Lat., meal). Starchy preparation used for food or in the industrial arts. The food-products of cereal grains and pulses, and starchy stems, roots, and tubers, are collectively called farinaceous. Farina is defined under the U.S. Federal Food, Drug, and Cosmetic Act, 1938, as a wheat food product representing closely ground endosperm particles, sufficiently freed from bran and germ to give an ash content not exceeding 0.6 p.c. on a dry weather basis.

The farina used for sizing cotton textiles is principally potato starch, comprising normally starch 82.70 p.c., cellulose and ash 0.58 p.c., and water 16.72 p.c. It yields a thicker paste, and owing to its sparse nitrogenous matter is less liable to mildew than any other starch. It is mixed with wheat flour and china clay for stiffening fabrics, and because of its purity is the chief source of dextrin. Fossil farina or rock-meal is a white crumbly form of calcium carbonate.

**Farinelli** (1705-82). Professional name of the Italian singer Carlo Broschi. Born at Naples, Jan. 24,

Farinelli, Italian male soprano  
From an engraving

1705, Broschi was a pupil of Porpora, in whose opera, *Eumene*, he made his first appearance in 1722. This made him famous, and procured him lucrative engagements in Vienna and London. In 1736 he went to Madrid and became a favourite of Philip V. There he remained for 25 years, being loaded with honours and exercising almost regal powers. His last years were passed at Bologna, and he died July 15, 1782. The exceptional beauty and range of Farinelli's voice and his wonderful control over it made him one of the most remarkable male sopranos who have ever lived.

**Faringdon.** Market town of Berkshire, England, known also as Great Faringdon. It is 17 m. S.W. of Oxford, and has a railway station. All Saints Church is a large building with brasses and other memorials; other buildings are the market hall and Faringdon House. The agricultural centre for a large district, Faringdon has a trade in corn, cattle, etc. Market day, Tues. Pop. 3,009.

**Faringdon, ALEXANDER HENDERSON, 1ST BARON** (1850-1934). British business man and poli-

tician. He was born in London, Sept. 28, 1850, became a stock-broker, and in time was head of the firm of Greenwood & Co. Having joined the board of the Great Central rly. in 1894, he became chairman in 1899, and deputy chairman of the L.N.E.R. in 1922. In 1898 he was returned to parliament as Unionist M.P. for West Staffordshire, but lost his seat in 1906. During 1913-16 Henderson was M.P. for St. George's, Westminster. In 1902 he was made a baronet and in 1916 a baron. On his death, March 17, 1934, the title passed to a grandson, Alexander (b. 1902).

**Farington, JOSEPH** (1747-1821). A British painter and diarist. Son of a clergyman, he was born at Leigh, Lancs, Nov. 21, 1747, and became a pupil of Richard Wilson. Elected R.A. in 1785, he is best known for two collections of engraved views of English lakes, published in 1789 and 1816 respectively. Farington was one of the first to recognize Constable's originality. He died at Didsbury, Dec. 30, 1821.

In 1921 the discovery of a diary (1793-1821) and note-books promoted him to fellowship with such diarists as Pepys and Evelyn. It was purchased and made public by *The Morning Post*, and, edited by J. Greig, was published in 8 vols., 1922-28.

**Farini, LUIGI CARLO** (1812-66). Italian statesman. Born at Russi, near Ravenna, Oct. 22, 1812, he

Luigi Farini,  
Italian statesman

early became an ardent nationalist, and in 1843 was banished from the papal states. On the election of Pius IX in 1846 he returned to Rome as secretary to the ministry of the interior, and later was appointed to the department of public health. On the declaration of the Roman republic, 1849, he resigned, but, disappointed at the trend of Pius's policy, Farini went to Turin, and wrote in 1851 his famous *Lo Stato Romano dal 1815 al 1850*. The same year he became minister of public instruction and an ardent supporter of Cavour, creating a deep impression by his letters to Gladstone on Italian problems. In 1859 Farini was sent as Piedmontese commissioner to Modena, became dictator of the duchy, and negotiated the transfer of Modena, Parma, and Tuscany to

Piedmont Appointed minister of the interior 1860 he became premier of the new kingdom of Italy 1861-63 and died Aug 1, 1866

**Farjeon** Name of a family of British writers and musicians Benjamin Leopold Farjeon (1838 1903) journalist and novelist, was born in London of Jewish descent He emigrated and founded at Dunedin in 1861 the first newspaper published in New Zealand Returning to London he published Grif, 1870 his later novels, popular in their day dealt chiefly with mysteries and detection of crime He died July 23, 1903 He married Margaret (1853-1933) daughter of the American character actor, Joseph Jefferson, and descendant of the US president, Thomas Jefferson Of their four children

Harry (1878-1948), born May 6, 1878, studied at the R.A.M., at which he became professor of harmony and composition, 1903 His compositions included a piano concerto, symphony in D, idyll for oboe and orchestra, symphonic poem, Summer Vision, choral works and songs He died Dec 29, 1948

Eleanor, born Feb 13, 1881 made her reputation with light verse Nursery Rhymes of London Town established her as a writer of whimsical imagination and originality Martin Pippin in the Apple Orchard was one of the most popular of her fantasies, and in her autobiographical A Nursery in the Nineties, 1935, she gave an intimate picture of the early life of herself and her brothers

Joseph Jefferson, born June 4, 1883 wrote successful crime novels

and plays His thrillers, No 17 and The Green Dragon, were dramatised, and his later books included Underground, The Z Murders Tiunk Call A number of his stories and serials were broadcast

Herbert (1887-1945) was born March 5, 1887 As journalist and dramatic critic he wrote for the Daily Herald, 1919-23, the Daily Express, 1923, Vogue 1921-23, and 1927-35 As a dramatist he first achieved fame with Adversity April, 1923, and, in collaboration with his sister Eleanor, wrote revues and light operettas, notable for their wit and delicate satire The Two Bouquets, 1936, Nine Sharp, 1938, An Elephant in Arcady, 1939, Light and Shade, 1943 He presented a series of intimate revues (the Little Revues) at the Little Theatre, London 1938-42 He died May 3, 1945

**Farley, JOHN MURPHY** (1842-1918) Irish American prelate Born at Newton Hamilton, co Armagh, April 20, 1842, he was educated in Monaghan, New York, and Rome Ordained priest in 1870, he was assistant pastor of St Peter's New Brighton, Staten Island 1870-72, secretary to Archbishop McCloskey 1872-84, private chamberlain to Leo XIII 1884 vicar general, New York diocese 1891, and domestic prelate to Leo XIII, 1892 Consecrated auxiliary bishop of New York, 1895 he became archbishop of New York, 1902, was made a cardinal, 1911, and died Sept 17, 1918 He wrote A Life of Cardinal McCloskey 1900

efficiency increases with decreasing size of holding, and that there is an increase in output for market in spite of greater home consumption This is due, at least in part, to the fact that labour per acre decreases as the size of holding increases Capital invested in buildings per acre also decreases with size of holding

In some countries and districts the farm buildings and dwelling houses are grouped together in hamlets or villages, and both live stock and machinery have to be taken out to the land which surrounds them More commonly the buildings of a farm are isolated in the centre of the holding

#### Different Types of Farms

The following are the chief kinds of farm to be found throughout the world (1) general or mixed, (2) dairy, (3) purely arable, (4) horticultural (5) specialist (6) ranch cattle, or sheep station (7) hill sheep

Family farms everywhere are usually general or mixed farms Much of the food consumed by the livestock is grown on the holding while their manure returned to the land, helps to fertilise it, the mixed farm thus being the best means of keeping the land fertile Current tendencies are, however towards specialisation, and the farmer running a mixed farm unless it is large enough to allow of specialist managers for its different branches, may fail, since he cannot well be a specialist in all branches

The dairy farm is generally a special type of the mixed farm in which livestock is restricted to dairy cattle Such a farm flourishes particularly if within easy reach of a large centre of population Purely arable farms are to be found chiefly away from cities, and are often devoted to monoculture In the past, it has not been uncommon for a farmer to crop virgin land continuously for several years without manuring and then, when its fertility has been seriously reduced, pass on to fresh virgin land As the extent of virgin land decreases, and settlement increases, treatment with so called artificial fertilisers, or other forms of manure, becomes essential

Fruit, vegetables, flowers, and such special crops as rhubarb, watercress, herbs, etc., are the principal products of horticultural farms It is sometimes difficult to differentiate between a farm and a market garden, but the horticultural farm proper has some live stock, and its crops, with the exception of trees, are grown in a

## FARM: TYPES AND PRODUCTS

R. W. Haddon Managing Editor Farmer & Stockbreeder

*Farm is a term covering a unit producing a wide variety of materials but based always upon the land and its fertility See also Agriculture Crops Monoculture Rotation of Crops etc*

The farm is most simply defined as the unit of organized production from the land, whether the produce takes the form of crops for direct human consumption, of animal products, or of vegetable fibre for clothing and other purposes It had its beginnings with the first development of settled human communities The size and nature of the unit vary widely both according to the type of production concerned and the political structure within which land is held The small holding of the Chinese or Indian peasant may be no more than an acre, while the ranches of America may extend up to 20 000 acres, and sheep and cattle stations in Australia up to

30,000 acres In Soviet Russia, the large state farms average about 40 000 acres (see Sovkhoz) the collective farms about 1,200 acres (see Kolkhoz) The large arable estates of 1,000 acres upwards usual in central Europe up to the Second Great War were for the most part broken up immediately after it e.g. in Hungary, where in 1938 thirty six magnates owned over a million acres and the 1,200,000 peasants 950,000 acres between them, a decree of 1945 limited peasants' estates to 250 acres, others to 140

The majority of farms throughout the world are from 3 to 500 acres It is generally accepted that, down to 10 acres, economic

purpose electric motor drive. 6. Portable electric motor operating a milk churn. 7. Mobile electric motor used for barn loading. 8. Iron rick stands which raise the base of a stack three feet clear of the ground.

# **FARM: FITTINGS AND MACHINERY OF THE FARMYARD**

*Photos 2 and 7, Farmer and Stockbreeder*

rotation with farm crops (*see* Rotation of Crops).

Specialist farms concentrate in the main on one crop or stock; many of them are associated with pig and poultry rearing. Hill sheep farms are typical of the mountainous districts of Scotland, Wales, and the  of England.

Ranches, estancias, and cattle and sheep stations are found in the open, uncultivated spaces of N. and S. America and of Australia.

The farm has tended to retain its identity as a unit over long periods, and the farm buildings of the past have often been of very solid construction, unsuitable for adaptation to changing technical developments. New buildings are, however, frequently constructed on simple lines which make rapid adaptation to new requirements easy. Developments in transport, and in the use of machinery to do work previously done by human labour, have also influenced the construction of farm buildings.

The transmission of electricity to the farm has probably effected the most revolutionary change in its economy. While in Denmark very few, even of the smallest holdings, are without main electricity, in England and Wales of the 290,600 farm units covered by the national farm survey of 1941-43, only 77,400 were connected to a public supply, more than half for light alone; 8,700 had a private supply. The cost of installation and upkeep of wiring to carry a comparatively small load, rather than lack of appreciation of the value of electricity to the farmer, hinders its wider application in Great Britain. Electricity probably has most to offer to the dairy farmer in the form of power for milking machines, cooling plant, washing and sterilising of apparatus but it has many uses in general and poultry farms, as well as in horticulture, for *e.g.*, crop drying, grain sprouting, electro-silage, electroculture, beehive heating, ultra-violet irradiation, electric fences, temperature control in storage places.

**Farman, HENRI** (b. 1874). French aviator and aircraft designer. Son of an English journalist, he was born in Paris May 26, 1874. He became a racing cyclist and later founded a factory for the production of cycles and motor cars. He took up aero-

nautics in 1907 and flew the first Farman aircraft, a biplane, at Issy-les-Moulineaux. In 1908 he established a flying school and aircraft works at Buc, near Versailles, and a year later at Reims became the first pilot to fly a circuit of 100 miles.

In 1910 Henri Farman's brother Maurice founded an aircraft factory, and in 1912 the two combined their resources to erect a new factory at Billancourt. They specialised in the construction of military biplanes and supplied large numbers to the British and French governments, notably the Maurice Farman "Longhorn" and "Shorthorn." The Farmans originated the pusher type of air-screw, and spent several years developing a stratosphere aeroplane with pressurised cabin.

**Farmer.** One who farms land, an agriculturist. Originally the word had a different meaning, referring to one who collected the taxes by contract. The farmer collected as much as he could, but paid over a fixed sum, called the *firma*, to the king. There was a system of this kind in Rome; it was followed by the sheriffs in medieval England. The word was used later for one who took over a piece of land, paying a fixed sum for the right to cultivate it. *See* Agriculture; Farm.

**Farmer, JOHN** (1835-1901). A British musician. Born at Nottingham, Aug. 16, 1835, he studied music at Leipzig and Coburg, and afterwards taught it at Zürich. In 1862 he settled at Harrow, and in 1864 was made music master. From 1885 until his death on July 17, 1901, he was organist of Balliol College, Oxford, where he arranged Sunday even-

John Farmer, British musician  
Elliot & Fry

organist of Balliol College, Oxford, where he arranged Sunday evening concerts and founded the Musical Society. In addition to his song tunes, Farmer wrote oratorios and edited volumes of songs for soldiers and sailors, and for children.

**Farmer, SIR JOHN BRETLAND** (1865-1944). British botanist. Born at Ather-

stone, April 5, 1865, and educated at Magdalen College, Oxford, he was demonstrator in botany to the university, 1887. In 1892 he became assistant professor of biology at the imperial college of science, S. Kensington. In 1895 his chair was made independent. During 1907-29 he was professor of botany and director of the biological laboratories there. He organized the Forest Products Research Board; and he helped to found a college of tropical agriculture in Trinidad. Knighted in 1926, an F.R.S. and royal medalist, Farmer died Jan. 26, 1944.

**Farmer-General.** Member of a financial organization in France under the monarchy, who, in consideration of payment of an agreed sum to the government, secured the privilege of collecting taxes. The system, based upon that of the Roman publicans (*q.v.*), seems to have been in existence in France in the 14th century and was firmly established in the 16th. Following the Revolution the farmers-general were abolished.

**Farmers' Club.** London club founded in 1842, for those interested in agriculture. It is housed at 2, Whitehall Court, S.W. The term is also often applied to the co-operative trading societies formed under the auspices of the Agricultural Organization Societies of England, Scotland, and Ireland. *See* Agriculture.

**Farmer's Wife, THE.** Comedy of Devon county life by Eden Phillpotts. Produced at the Court Theatre, London, March 11, 1924, it ran for 1,329 performances, and made the reputation of Sir Cedric Hardwicke, who appeared as Churdles Ash. It was revived in 1928 and 1932.

**Farnborough.** Urban dist. and parish of Hampshire, England. It is 33 m. S.W. of London, with a rly. station. A mausoleum attached to S. Michael's Roman Catholic church, built by the Empress Eugénie, contains the remains of Napoleon III, the Prince Imperial, and the empress herself, who for many years lived at Farnborough Hill. Farnborough is within the Aldershot military area and contains North camp, also a Government air research station founded as the Royal Aircraft

Farnborough. Mausoleum in which Napoleon III, the Empress Eugénie, and the Prince Imperial are buried

Factory in 1912, and concerned with the production and testing of new airframes, engines, and instruments. This has a vertical wind tunnel for studying the causes of spinning, and the Queen Bee (*q.v.*) target aircraft was developed there. The Royal Aircraft Establishment is staffed with R.A.F. officers for flying duties and civilian scientists for technical work. Pop. of urban dist., 24,000. Another Farnborough is a village in Kent, 4 m. S.E. of Bromley, and others are in Berkshire and Warwickshire.

**Farnborough**, THOMAS ERSKINE MAY, BARON (1815-86). British historian. Born in London

T. Erskine May, Baron Farnborough

on Feb. 8, 1815, he was educated at the Bedford grammar school. In 1831 he became an assistant in the library of the house of commons, and in 1833 was called to the bar. In 1846 he was made an examiner of private bills; in 1847 a taxing master; and in 1856 a clerk assistant to the house. In 1871 he was appointed clerk of the house of commons, and he retired in April, 1886, dying in London on May 17. He had been made a peer a few days before his death, but left no heir. Erskine May's long association with the house of commons, together with his aptitude for research, made him the chief authority on its procedure. He wrote a Treatise on the Law, Privileges, Proceedings, and Usage of Parliament, 1844; and devoted himself to the constitutional history of England, and his work dealing with the period 1760-1860, published 1861-63, remains the standard authority.

**Farne**, FEARNE, OR FERN ISLANDS, OR THE STAPLES. Group of seventeen rocky islets and rocks off the coast of Northumberland, England, separated from the mainland by the Fairway Channel. Farne or House, the largest (16 acres), was the retreat of S. Cuthbert (*q.v.*) in the 7th century, and Longstone with its lighthouse is famous for its association with Grace Darling (*q.v.*).

**Farnell**, LEWIS RICHARD (1856-1934). English scholar. He was born at Salisbury Jan. 19, 1856. As fellow of

Exeter College, Oxford, he studied classical architecture in Germany, Greece, and Asia Minor. He was rector of his college 1913-23 and vice-chancellor of the university 1920-23. He died March 29, 1934. The leading authority of his day on Greek religion, Farnell published *The Cults of the Greek States*, 1896-1909; *Hero-Cult*, 1921; *Outline of the History of Greek Religion*, 1921; and his reminiscences, *An Oxonian Looks Back*, appeared posthumously.

**Farnese**. Name of the Italian ducal family of Parma during the 16th and 17th centuries. First appearing in history as lords of Farnete, in Tuscany, in the 12th century, they became prominent by the election as pope Paul III of Alessandro Farnese, 1534, brother of Giulia, favourite of pope Alexander VI. In 1545 Paul gave the duchy of Parma to his natural son Pierluigi (1503-47), a notorious libertine, murdered by partisans of Charles V at Piacenza. Of Pierluigi's sons, Alessandro (1520-89) became a cardinal in 1534, and completed the Farnese Palace (*v.i.*) in Rome, while Ottavio (1521-86), after a long struggle with his grandfather the pope, became 2nd duke of Parma in 1551, recovering Piacenza a few years later. His son Alessandro was the famous soldier in Spanish service, better known as the 3rd duke of Parma (*q.v.*).

Elizabeth Farnese (1692-1766) was the last notable member of the family. The daughter of Odoardo Farnese, she married in 1714 Philip V of Spain, whose weakness, and later insanity, left her the

virtual ruler of Spain during his nominal reign. With Cardinal Alberoni she worked for the restoration of Spanish rule in the lost Italian provinces, a scheme broken only by the demands of the Quadruple Alliance in Jan., 1720. The Farnese succession ended with Antonio (1679-1731). Consult Elizabeth Farnese, E. Armstrong, 1892.

**Farnese Palace**. Building in Rome, one of the finest examples of later Renaissance architecture. It was designed and begun in 1530 by Antonio da Sangallo, and the work was carried on and completed by Michelangelo, Vignola, and Giacomo della Porta. The length of the front façade is 190 ft., and the building is 260 ft. deep and 97 ft. high to the top of the cornice. The latter, the most striking feature, was added by Michelangelo, who was also responsible for the upper

Farnese Palace, Rome. Arcade of the courtyard, a magnificent example of the architectural work of Michelangelo

storey which it crowns. The courtyard on the S. side is surrounded by arcades, modelled on those of the Colosseum. The building was commissioned by Cardinal Alessandro Farnese, later Pope Paul III, and remained in the possession of the Farnese family until the latter became extinct in the 18th century. It then passed, with the Villa Farnesina, to the king of Naples.

**Farnham**. Market town and urban district of Surrey, England. It stands on the river Wey, 38 m. S.W. of London, and has a railway station. The centre of a district in which hops are grown, it has trade therein and in other agricultural produce, which it has developed partly owing to its proximity to Aldershot. S. Andrew's church is a noble Transitional edifice, and other buildings include the town hall, an old grammar school, and Georgian houses.

Above the town stands the castle, residence of the bishop of Guild-

Farne. S. Cuthbert's church, Inner Farne, on the site of the hermitage where the saint died in 687  
Valentine

ford. The first castle was built in the 12th century, but this and also its successor were destroyed. The present building dates mainly from the 17th century. Near the town are Moor Park, the residence of Sir W. Temple, where for a time Swift lived, and the ruins of Waverley Abbey, the earliest English Cistercian house. Farnham belonged to the bishop of Winchester before 1066, and one of the bishops made it a chartered town. Having decayed, it ceased to be a borough in 1789. Here Cobbett was born, his birthplace being now an inn, The Jolly Farmer. Caesar's Camp, 2 m. N., dates from the Iron age. Market day, Mon. Pop. 23,000. Other places called Farnham are in Bucks, Dorset, and Suffolk.

**Farnham.** Town of Quebec, Canada. It is on Yamaska river, in Missisquoi co., 40 m. E.S.E. of Montreal, and is served by C.N.R. and C.P.R. With a government experimental tobacco farm, it is the centre of a tobacco growing region, and has sawmills and butter and cheese factories. Pop. 4,258.

**Farnol,** (JOHN) JEFFREY (b. 1878). British novelist. Born Feb. 10, 1878, and educated at a private school, he began writing while in his teens. In 1902 he went to America, where he painted theatrical scenery, and published his first volume, *My Lady Caprice*, 1907 (later reissued as *Chronicles of the Imp*). In 1910 he returned to England, and with *The Broad Highway* achieved popularity as a writer of healthy sentimental adventurous romance, with a special interest in pugilism. Later stories included *The Amateur Gentleman*, 1913; *Beltane the Smith*, 1915; *Black Bartlemy's Treasure*, 1920; *The Quest of Youth*, 1927; *The Jade of Destiny*, 1931; *The Way Beyond*, 1933; *Murder by Nail*, 1942.

**Farnworth.** Borough of Lancashire, England, 3 m. S.E. of Bolton, of which it is practically a suburb. It has three railway stations, and a tramway service. Sharing in the industries of Bolton, it has spinning mills, engineering works, and machinery shops, while around are coal mines. S. John's is the principal church. The council owns markets, baths, cemetery, sewage works, town hall, library, and parks and recreation grounds. Water is supplied from Bolton. Farnworth gives its name to a parliamentary division of Lancashire. Market days, Mon. and Sat. Pop. approx. 26,000.

**Faro.** Gambling card game. It is one of the oldest of banking games, supposed to be of Italian origin,

and under the name of Pharaoh was very popular in the time of Louis XIV. It requires costly apparatus and a lay-out. A full pack of 52 cards is put into a dealing box with an open top, one card being released at a time. The first card in sight at the beginning of each deal is called *soda* and the last card left in the box is *in hoc*. The dealer or banker withdraws *soda* and places it some little distance away; the next card, termed *the loser*, he lays by the side of the box. The third card taken out is *the winner*, which he places on the *soda*; thus, each alternate card is a winner or loser, eventually forming two separate piles, with *soda* and *loser* for foundation. The object of the players is to forecast correctly (indicated by the way in which they stake their money upon the lay-out) which particular card of any suit will win or lose.

**Faro.** Administrative dist. of S. Portugal, coextensive with the prov. of Algarve. The climate is genial and the soil fertile, producing olives, dates, almonds, figs, and cereals. Area 1,937 sq. m. Pop. 317,628.

**Faro.** Seaport and city of Portugal, capital of Algarve prov., and an episcopal see. It stands on the Atlantic, at the mouth of the Rio Feroso, 20 m. S.W. of Tavira, and is the terminus of the Lisbon-Faro rly. Its harbour is large and sheltered, but shallow and tidal. The town possesses a cathedral, a military hospital, a museum, and a ruined Moorish castle. Its large public square is the centre of the life of the city. It exports fruit, vegetables, wine, cork, sumach, sardines, anchovies, tunny, and baskets. Faro was taken from the Moors by Alphonso III of Portugal, burned by the English in 1596, and almost destroyed by an earthquake in 1755. Pop. 19,695.

**Faroe Islands** (Dan. *Färøerne*, sheep island). Group of islands in the N. Atlantic, belonging to Denmark. The group lies about 195 m. N.W. of the Shetlands, and 250 m. S.E. of Iceland. There are 21

islands, 17 of them inhabited. Of volcanic and basaltic formation, they are mountainous, rising in Slátarretinde in the island of Ostero to 2,890 ft., with lofty and steep cliffs and deep fjords, and separated from each other by swift and dangerous currents. The rainfall is heavy, and storms are frequent. Lying between lat. 61° 20' and 62° 20' N., not a great distance from the Arctic Circle, the islands are mild but moist, and the harbours are seldom frozen. There are no trees, and barley is the only cereal grown: turnips and potatoes thrive, coal and peat are found.

The chief industries are sheep raising, cattle breeding, wild-fowling, whaling, and fishing. Sheep, fish (wet and dried), wool, feathers, skins, tallow, butter, and fish-oil are exported. The largest island is Strömö, with the capital, Thorshavn; Suderö is the next largest. There are cathedral ruins in Kirkøb on Strömö. Colonised by the Norwegians in the 9th century, the Faroes became Danish in 1380. The people still speak an old Norse dialect. They have a local parliament which in 1948 was granted complete autonomy by Denmark. In religion the Faroese are mostly Lutheran. The chief magistrates of the islands are an amtman, who is also a military commandant, and a land-vogt, who is the chief of the police.

After the German invasion of Denmark in 1940, the Faroes were occupied by Great Britain to prevent their becoming a base for enemy operations against Allied shipping. A force of Royal Marines landed at Thorshavn without opposition on April 13, 1940. A radio station and aerodrome were laid out there, and R.A.F. flying-boats operating from the Faroes did invaluable work escorting convoys and hunting submarines. The British bases on the islands helped to prevent blockade running to the Norwegian coast. The islands retained their own internal administration, and at the end of the war the British garrison was withdrawn. Area 540 sq. m. Pop. 25,744.

Faroe Is. Klaksvig, the principal town on Bórðo Island, and Klaksvig Mountain

**Farouk I** (b. 1920). King of Egypt. Son of Fuad I and Queen Nazli, he was born in Cairo, Feb. 11, 1920, and spent his childhood in Naples and Rome. Created Emir es Said, or prince of Upper Egypt, in 1933, he lived in England 1935-36, when he studied for the R.M.A., Woolwich. Recalled to Egypt on the death of his father, April 28, 1936, he attained his majority at the age of 18 lunar years, and was invested as king in parliament on July 29, 1937. Until then the royal powers were exercised by a council of three regents. Farouk married Farida Zulfikar, 1938, divorcing her 1948, and had three daughters: Princess Ferial (b. 1938); Princess Fawzieh (b. 1940); and Princess Fadia (b. 1943). For the events of his reign, see Egypt, History.

**Farquhar, GEORGE** (1678-1707). Irish dramatist. Born in Londonderry and educated at Trinity College, Dublin, he started life as an actor in Dublin, but obtained a commission in the army, 1702. His first play was *Love and a Bottle*, 1699, which was followed by *The Constant Couple*, 1700; and *Sir Harry Wildair*, 1701. His most notable production was *The Beaux' Stratagem*, 1707, two characters in which, *Lady Bountiful* and *Boniface*, the innkeeper, have passed into the language as types. The *Recruiting Officer*, 1706, contains the song *Over the Hills and Far Away*. Farquhar died in pecuniary difficulties. He had sold his commission to marry a professed heiress, who turned out penniless. Farquhar magnanimously forgave her. His large-heartedness is reflected in his comedies which, not perhaps so witty as those of Congreve, are pervaded by a sympathy that gives reality to plot and characters. His complete works, ed. C. Stonehill, were issued 1930.

**Farr, THOMAS GEORGE** (b. 1914). Welsh boxer. A native of Tonypandy, Glam., he worked as a youth in the coal mines, but sought

a new career as a professional boxer. From the humblest beginnings, he became British heavyweight champion on March 15, 1937, defeating Ben Foord, and in Aug. went the full 15 rounds with Joe Louis, world champion, losing only on points. "Tommy" Farr was the first Briton to fight for the world heavyweight title since 1911. He relinquished the British title early in 1938.

**Farragut, DAVID** GLASGOW (1801-70). American sailor. Born at Knoxville, Tenn., July 5, 1801, of Spanish descent, he entered the navy, and in 1825 was promoted lieutenant. When the Civil War came in 1861, notwithstanding his southern birth, he offered his services to the Washington government, and in 1862 was given command of the Western Gulf blockading squadron. His great popularity was intensified by his brilliant forcing of the passage of the Mississippi and capture of New Orleans. After an unsuccessful operation against Vicksburg, with the aid of monitors he defeated Buchanan at Mobile in 1864, but his health being undermined by the climate he returned to New York the same year, being made the first rear-admiral of the U.S. navy. In 1866 he was promoted admiral, and retired 1867. He died at Portsmouth, New Hampshire, Aug. 14, 1870.

**Farrant, RICHARD** (c. 1530-80). British organist and composer. A gentleman of the Chapel Royal, Farrant was for some time organist of S. George's Chapel, Windsor. Much of the music attributed to him has been proved to be by other composers, but it is probable that he composed the beautiful anthems, *Call to Remembrance*, and *Hide Not Thou Thy Face*. He died Nov. 30, 1580.

**Farrar, FREDERIC WILLIAM** (1831-1903). British divine and writer. Born at Bombay, Aug. 7, 1831, he was educated at London University and Trinity College, Cambridge, and became in 1855 an assistant master at Harrow. He was headmaster of Marlborough College from 1871 to 1876, when he became canon of Westminster and rector of S. Margaret's, being appointed archdeacon of Westminster in 1883. Farrar

was made dean of Canterbury in 1895. His *Life of Christ*, 1874; *Life of S. Paul*, 1879; and *Lives of the Fathers*, 1889, were successful; but he is also remembered for his school stories, including *Eric*, or *Little by Little* (q.v.), 1858. Dean Farrar died March 22, 1903.

**Farren, ELIZABETH** (c. 1759-1829). British actress. The daughter of a Cork surgeon turned actor,

Elizabeth Farren, British actress After Sir T. Lawrence

she made her first London appearance at The Haymarket, June 9, 1777, as Kate Hardcastle. She made her debut at Drury Lane, Sept. 8, 1788, as Charlotte Rusport in *The West Indian*, and acted at this theatre and The Haymarket till her retirement in 1797. At Drury Lane she succeeded Mrs. Abington as the impersonator of fine ladies, e.g., Lydia Languish, Millamant, Lady Teazle, and Angelica in *Congreve's Love for Love*. In 1797 she married the 12th earl of Derby. She died April 23, 1829.

**Farren, ELLEN OR NELLIE** (1848-1904). A British actress. A granddaughter of William

Farren (v.i.), and born at Liverpool, April 16, 1848, she played in comedy, farce, and burlesque at Sadler's Wells, The Olympic, and Queen's. She joined John Hollingshead's company in 1868 at the (old) Gaiety Theatre, where she remained under his management, and that of George Edwardes, till her retirement in 1891. She was unrivalled as principal boy. She died April 28, 1904.

**Farren, WILLIAM** (1786-1861). British actor. He made his debut on the London stage, Sept. 10, 1818, as Sir Peter Teazle at Covent Garden, where he remained till 1828. He played Sir Peter at Drury Lane, Oct. 16, 1828, remaining a member of the company till 1837.

William Farren, British actor From a daguerreotype by Mayall

George Farquhar, Irish dramatist From an old print

F. Farrar Elliot & Fry

He returned to Covent Garden, which he left a few years later to join Benjamin Webster as stage-manager at The Haymarket, where he stopped ten years. Subsequently he managed The Strand and The Olympic, taking leave of the public at The Haymarket, July 10, 1855, in his favourite part of Lord Ogleby in *The Clandestine Marriage*. As the old man of 18th-century comedy he was unrivalled. He died Sept. 24, 1861.

**Farrer, THOMAS HENRY FARRER, 1ST BARON (1819-99).** British economist. The son of a London solicitor, he was born June 24, 1819. Educated at Eton and Balliol College, Oxford, he became a barrister, but his career was influenced by his close friendship with Sir Stafford

*Farrer*

Northcote, who secured for him in 1848 a position in the board of trade. During 1865-88 he was permanent secretary to the board. He was instrumental in securing legislation concerning merchant shipping and bankruptcy. In 1883 he was made a baronet, in 1893 a baron. As an economist Farrer made his reputation after his retirement. He was a strong free trader and a critic of high national expenditure and bimetallism. He died Oct. 12, 1899. Of his writings the best known is *Studies in Currency*, 1898.

**Farrier.** Name given originally to a man who shod horses, the word being derived from the Latin *ferrum*, iron. After a time the farrier began to attend to the diseases of the horses, and farriery was the name for what is now more generally known as veterinary surgery (*q.v.*).

**Farriers' Company, THE.** London city livery company. Dating from 1356 as a fraternity, it was granted a charter in 1674. Farriers, who were also called ferrers, ferriers, and ferrones, are mentioned in the 13th century. They owe their ordinances to a complaint that certain unskilled

**Farriers' Company arms**

ferrones, having set up forges in the city, had caused damage to or loss of many horses. In 1758 an act of common council confirmed on all operative farriers the obliga-

tion of taking up the freedom of the company. While this rule has been abandoned the company has long taken an active interest in the welfare of the craft by the offer of prizes for good workmanship, etc., and in 1890, in cooperation with the Royal Agricultural Society and the Royal College of Veterinary Surgeons, promoted a scheme for the national examination and registration of farriers or shoeing-smiths. The archives of the company were almost entirely destroyed by fire in 1666. Its offices are at 80, Bishopsgate, E.C.

#### **Farringdon Street.**

London thoroughfare running S. from Charterhouse Street to Ludgate Circus, E.C. Named after the city ward in which it is situated, it was built over the Fleet Ditch, now a sewer, in 1826-30. Fleet Market, which once occupied the site, was opened Sept. 30, 1737, and for 92 years remained a centre for the sale of meat, fish, and vegetables. It was removed in 1829-30. The market for fruit and vegetables built between Farringdon Street and Shoe Lane, N. of Stonecutter Street, and known as Farringdon Market, was opened Nov. 20, 1829, but the site, which covered 1½ acres, was sold in 1892 and later covered by a fine block of buildings.

Farringdon Street is spanned by Holborn Viaduct, and contains the Memorial Hall (*q.v.*), built to commemorate the fidelity to conscience of 2,000 ministers ejected from the church in 1662 by the

Act of Conformity; The Fleetway House, headquarters of the Amalgamated Press; and is fronted on the E. side by part of the London Central (Smithfield) Markets. Fleet Prison stood on ground partly occupied by the Memorial Hall.

N. of Charterhouse Street is Farringdon Road, notable for its open market and bookstalls, with a Metropolitan rly. station (Farringdon) and a large goods station and depot. Farringdon Road was originally called Victoria Road. It extends to King's Cross Road, and was made in 1856. Street and road were heavily damaged by German bombs in the Second Great War, over 100 lives being

lost when a rocket bomb fell, March 8, 1945. See Fleet Prison.

**Farrow's Bank.** Former British bank. Founded in 1904 by Thomas Farrow (1862-1934), it was registered as a credit bank under the Industrial and Provident Societies Act. In 1907 it was registered as a joint stock company. With a capital of £1,000,000, the bank had 75 branches, mainly in England. The bank closed its doors in Dec., 1920, with great loss to small depositors, and in 1921 Farrow and another official were sentenced to imprisonment for fraud in that connexion.

**Fars or Farsistan.** Province of Persia. It lies on the E. side of the Persian Gulf, and is bounded on the N.W. by Khuzistan and Isfahan, E. by Yezd and Kerman, S. by Laristan. From the warm coastal plain the country rises into the mts., where the climate is cold. The highest mt. is the Kuh-i-Bul, 13,000 ft. The rivers are small and not numerous. There are several lakes, the principal being Niris. The capital is Shiraz, and the chief port Bushire. The province con-

**Farringdon Street.** View looking north towards Holborn Viaduct; on right, marked by clock, is The Fleetway House

tains the ruins of Persepolis, ancient capital of the Persian empire. Many parts of the province are fertile, and produce wheat, barley, rice, cotton, fruits in profusion, and an excellent tobacco.

**Farsetia.** Genus of annual and perennial herbs and sub-shrubs of the family Cruciferae. Natives of S. Europe, Asia, and Africa, they have opposite, undivided leaves, and white or yellow flowers.

**Farson, NEGLEY (b. 1890).** American journalist. Born at Plainsfield, N.J., May 14, 1890, he went to Pennsylvania university and became a civil engineer. After the First Great War he represented the Chicago Daily

News as special correspondent in India and Egypt, and later in Europe, spending five years in London. He resigned in 1935. His autobiography, *The Way of a Transgressor*, 1935, attracted wide attention by its vivid and adventurous subject matter. His other books included *Behind God's Back*, 1940, *Bomber's Moon*, 1941, and *Going Fishing*, 1942.

**Farthing** (A.S. *feorþa*, fourth). Name of the smallest British bronze coin, value one quarter of

Farthing. Obverse and reverse of a 1949 George VI farthing

a penny. From its first appearance under Edward I, until about 1555, it was a silver coin. A copper farthing was coined in 1613, but did not form part of the true coinage till a reissue in 1672, under Charles II, who also struck a tin farthing, with a circle of copper inset, in 1684. Copper half-farthings circulated between 1842-69. The farthing became a bronze coin in 1860, and has a standard weight of 43.750 grains. The coin is legal tender up to the number of four at one time. The wren design introduced on the reverse of the coin in 1937 is said to symbolise the least of the British coins by the smallest of British birds.

**Farthingale** (Span. *verdugado*, hooped). Hooped framework supporting and extending a wide skirt. The fashion was introduced from Spain into England in the time of Elizabeth, and continued until about the middle of the 17th century. It grew to a prodigious size, the big hoop at the level of the hips giving a flat, circular surface, and keeping the skirt well away from the figure. The farthingale, as it was then called, was revived in rather a different form in the time of Queen Anne, when the skirt became more bell-shaped. It was abolished by royal command in George IV's reign. See Costume.

**Farukhabad.** District and town of India. In the E. of the Agra division of the United Provinces, the area of the district is 1,642 sq. m. The town was founded early in the 18th century. Farukhabad city lies near the Ganges, on the rly. from Cawnpore to Muttra, and at the end of a

branch of the E. Indian rly. from Shikohabad. It forms with Fatehgarh, 3 m. S.E., the headquarters of the district and the cantonment, a single municipality. Cloth printing is the chief industry. The principal crops are wheat, barley, millet, and gram; the poppy, cotton, and sugar-cane are also grown; tobacco is exported. Pop. of dist., 955,377, five-sixths Hindus.

**Farwell, Sir George** (1845-1915). English judge. Born at Codsall, Staffs, Dec. 22, 1845, he was educated at Rugby and Balliol college, Oxford, and called to the bar in 1871. Judge of the high court from 1899, he gave judgement in the famous Taff Vale (*q.v.*) case, in 1901. Reversed by the court of appeal, his judgement was upheld by the house of lords, and led directly to the passing of the Trade Disputes Act in 1906. Farwell was a lord of appeal 1906-13. He died Dec. 30, 1915.

**Fasano.** Town of Italy, in the prov. of Brindisi. It is 35 m. by rly. N.W. of that port. The old palace of the Knights of S. John is now the town hall. In the vicinity are the ruins of Egnatia, an ancient port on the Apian Way. Situated in an olive-growing district, Fasano has many oil mills. Pop. 17,180.

Fasces. Roman symbol of magisterial authority

**Fasces** (Lat. bundles). Bundles of rods with an axe bound up in the centre. Such a bundle was the emblem of authority in ancient Rome, although it originated with the Etruscans. Fasces were carried before the consuls by lictors. The consul was preceded by twelve lictors bearing fasces, and the head of the state by 24; praetors of towns, of provinces, and of the army, had fewer. Under the empire the consuls, who then ranked merely as civil magistrates, had eight fasces. Fasces have been used as their emblem by various Italian political associations, and were adopted by Mussolini in 1919 as the badge of his party. See Fascism.

**Fascia.** In anatomy, layer of connective tissue interposed between the skin and the muscles, and prolonged inwards between the muscles so as to form sheaths around them. The strength and

thickness of fascia vary in different parts of the body. On the outer side of the thigh, *e.g.*, it forms a dense, strong structure, the *iliotibial band*, which helps to steady the body in the erect position.

**Fascia** or **Facia** (Lat. bandage, fillet). Architectural term applied originally to the bands or divisions of an Ionic entablature (*q.v.*), now extended to include any flat band or facing in an entablature. The strip of boarding over a shop front, bearing the name of the firm, is known as a fascia board.

**Fasciation.** Abnormal growth of stems when they become flattened, and the branches, instead of being separate, coalesce with the stem. This is the constant condition of the flowering parts of *Celosia cristata* (cock's comb *q.v.*); but is often found in other herbs and trees. The willow family and the ash often exhibit the abnormality in their upper branches.

**Fascine** (Lat. *fascina*, faggot). Cylindrical bundle of brushwood 6 to 18 ft. long and 6 to 9 ins. in diameter used in revetments of military earthworks. A fascine is built up on trestles and compressed by means of a choker or chains, and then bound at intervals with withies of flexible wood. When made of long, heavy boughs, a fascine is called a saucisson. Fas-

cines are also used in making sea and river walls to protect foreshores subject to washing, or to collect sand and silt to raise the bottom of water-covered

land to form an island, as a break-water against inroads or for land reclamation, as in the Netherlands.

Fasces. Mussolini's party badge applied to architecture: a factory at Torre di Zuino, Italy

## FASCISM: A POLITICAL THEORY

C. M. Franzero, Journalist and Writer on Italian Affairs

*The rise, doctrines, and history of the party which, embodied in Mussolini, ruled and ruined Italy between 1922 and 1943 See also Italy; Mussolini; Nazism*

Fascism was the name given to the political theory of the Italian party founded by Benito Mussolini in March, 1919, in Milan. It became, after the seizure by Mussolini of power in Oct., 1922, a synonym for the regime that governed Italy until July 25, 1943. The name, taken from the *fascies* (v.s.), was chosen to symbolize the close union of its adherents: its emblem was the fasces of the lictors on a tricoloured shield.

Fascism, as a doctrine and as a political conception, stood in direct antithesis to socialism and liberalism. Whereas the philosophy of both socialism and liberalism is based upon the importance of man as an individual, and national life is the sum of the aggregate of individuals in each country, according to fascism the state was paramount, and the individual of value only in so far as he subjected his interests to those of the state. No individual or group outside the state—political parties, cultural associations, economic unions, social classes was allowed. Fascism did not recognize the class-struggle likewise, and was opposed to trade unionism.

### Fascist Scorn for Peace

Fascism did not believe in the feasibility or utility of perpetual peace—a tenet which was the actuating principle of Italian foreign policy from 1922 until 1940. It discarded pacifism as implying supine renunciation, and proclaimed war as the apex of all human energies at their maximum tension. It despised all international structures such as the League of Nations—even if it accepted them as useful or expedient in the ordinary intercourse of international relations and politics. Instead, fascism exalted nationalism as the noblest human aspiration. Lastly, fascism rejected the economic interpretation of felicity as something to be secured socially at a given stage of economic evolution; though it found no better substitute for this than its somewhat cumbersome and obscure conception of the corporate state. From such a philosophy there could only follow, in the actual application of fascism as a form of rule, dictatorship described as the totalitarian state.

It is odd to recall that fascism was founded by Mussolini, who

had been a rabid socialist. One explanation might be that in 1919, when Italy after the First Great War found herself in the throes of spiritual and economic turmoil, socialism in that country, as a doctrine, was dead, and it existed in practice only as a grudge. In such conditions, it is understandable that fascism, with its conception of national will power as a manifestation of the country's vitality, should have appealed strongly to the politically untrained Italian masses.

### Its Revolutionary Programme

The first programme of fascism (March, 1919) was decidedly revolutionary. It demanded a constituent assembly which was to be the Italian section of the International Constituent Assembly of the Peoples; the proclamation of an Italian republic; the sovereignty of the people and the extension of the vote to women; the abolition of the senate; the abolition of all titles of nobility; the abolition of compulsory military service; international disarmament; dissolution of limited liability companies; abolition of the banks; conscription and limitation of private capital; confiscation of unproductive capital; the land for the peasants; management of industry transport, and public services by unions of technicians and workers.

This programme, however, was soon abandoned, and replaced by propaganda likely to secure to the new party the financial backing of the industrialists and the support of the lower middle classes, which in Italy are the backbone of the country. At the elections of 1919 no fascist candidate was returned; but during 1920 the new ideas gained ground, and Italy saw the coming into existence throughout the country of *squadre* or bands of young men calling themselves *squadristi*, mostly ex-servicemen made desperate by the prevailing disorder, who took upon themselves what they considered the defence of the nation against the revolutionary tyranny of the "red" elements. At that time there was as yet no real fascist doctrine beyond this vague sense of outraged patriotism; but when at the end of 1922 the party seized power, fascism soon caught the people's imagination and secured

general collaboration by a programme that can be summed up as follows: the prestige of the state to be restored at all costs; the national finances to be placed on a sound basis; private property to be recognized in its social function; the state to control class conflicts; no strikes in public services to be tolerated; in foreign affairs, Italy to reaffirm and fulfil her mission as the bulwark of Latin civilization in the Mediterranean.

Only too soon it became clear that the fascist party meant to be one with the state, and that the regime was to all intents and purposes a dictatorship. But Mussolini enjoyed a vast degree of popularity; he knew the art of making people endure his iron fist; and he never let events, internal or external, deflect him from making the entire life of the nation subservient to his ambitions and imperialistic dreams. Fascism, as an imposition of a dictator's will upon the people, touched its peak in June, 1940, when fascist Italy entered the Second Great War on the side of Nazi Germany, only to suffer defeat in every field. Fascism ended when Mussolini was overthrown on July 25, 1943.

### Interweaving State and Party

Twenty years of dictatorial rule were made possible only by interweaving in the closest manner the state and the party, till it was difficult to say where the line of demarcation, if any, existed. The hierarchy upon which the totalitarian fascist state rested was as follows: Mussolini was "chief of the government and Duce of fascism"; from him depended the government, the directorate of the party with its octopus-like machine reaching far and deep into the individual and collective life of the people; and next to Mussolini stood the fascist grand council which was in effect the supreme organ of the nation and had, in 1928, arrogated to itself the right of veto over the succession to the throne. Behind the party and regime was the fascist militia, described as voluntary although its members were handsomely paid and enjoyed exceptional privileges; it was nothing but the private army of the fascist party.

In the field of economics, fascism created the corporate state. The basic Act, 1926, of this new economic system regulated the legal and economic representation of employers and workers in all industries, trades, and professions, including agriculture. Associations for each trade or profession were

formed and called corporations. In 1927 the whole system received its special labour charter, the essential principle of which was that the activities of the corporations must never run counter to the interest of the state. The corporations were empowered to settle disputes over wages and labour, and to nominate members to sit on their many boards; eventually from the corporations were chosen the representatives who in 1937 composed the fascist chamber of corporations or the new kind of parliament of the fascist state, to take the place of the elective chamber of deputies, now discredited.

The labour charter of 1927 asserted the subordination of the individual citizen to national interests, and, although recognizing private initiative as the most effective instrument of production, it held the organizers of industry responsible to the state for results. Rapidly the whole system turned the entire economy of Italy into a machine working solely for the preparation of war. State finances, private capital, scientific research, technical direction, manual and intellectual labour—everything was made to converge towards the organizing of the corporate state for the ultimate end of war. The state and its interests were the supreme expression of the nation's life, with the dismaying result that when the fascist state collapsed, Italy crumbled into appalling chaos, political and economic.

#### The Movement outside Italy

The doctrine of fascism found many admirers, especially in its earlier period, when the iron rod of Mussolini's rule seemed to many foreign onlookers to work miracles in redressing the course of Italy's national life. Even in Great Britain a fascist movement sprang up, under the leadership of Sir Oswald Mosley, who in his varied career had been a conservative, a socialist, and an independent. His movement, modelled on German Nazism rather than Italian fascism, struggled on until it was banned in July, 1940. In several other countries the doctrine of fascism made its influence felt under different names and with various degrees of success, notably in Hungary, Rumania, Belgium, Spain, and Argentina. The most famous derivative from fascism was the National Socialist (Nazi) movement, founded by Adolf Hitler in Germany, where the disciple in every way surpassed the master, with what tragic results for mankind the world will never forget.

**Bibliography.** Fascism, Odon Por, 1923; The Fascisti Exposed, G. Matteotti, 1924; The Fascist Experiment, Luigi Villari, 1925; History of the Fascist Dictatorship in Italy, G. Salvemini, 1927; The Fascist Doctrine, Benito Mussolini, 1935.

**Fascists, BRITISH UNION OF.** Political party formed by Sir Oswald Mosley (*q.v.*) in 1931 after the collapse of his New Party (*q.v.*). Organized on German-Italian fascist lines, the B.U.F. was anti-Jewish and sought to introduce the leadership principle into government. Members wore a black uniform, used the Nazi-fascist salute with upraised arm, and sang the Horst Wessel song with an English text. The badge was a lightning flash surrounded by a circle. The B.U.F. caused serious disturbances by uniformed marches through the East End of London, members bearing anti-Jewish slogans, and in 1936 the Public Order Act forbade the wearing of political uniforms. A split occurred in 1937, when William Joyce (*q.v.*), formerly director of B.U.F. propaganda, and others broke away to form the National Socialist League.

Early in the Second Great War the union organized a campaign for concluding peace with Germany. On May 23, 1940, the police raided its headquarters in Westminster and arrested 34 members, including Mosley. The union was banned, July, 1940, and its leader and other members interned under defence regulation 18B (*see* Defence Regulations). In 1946 it was stated in the house of commons that before the war the Italian government subsidised the B.U.F. to the extent of £60,000 a year.

**Fasher, EL.** Town in the Anglo-Egyptian Sudan. Capital of Darhur province, it lies about 200 m. W. of El Obeid, and is a junction on the Sudan government rlys. and the centre of caravan trade.

**Fashion** (Lat. *fatio*, making; through old French *fachon*, method or *mode* of making). Without losing its general meaning, the word fashion has now acquired so close a relationship to the changing modes of clothing, particularly feminine clothing, that standing by itself it is taken to mean nothing else. The origins of feminine fashion have been examined throughout the centuries, largely by male (and frequently disapproving) observers. There exists a considerable literature on the subject, covering diverse considerations fanning out into psychology, history, sociological ideas of modesty, and the unsolved

problem of what constitutes beauty and good taste.

Fashion in the present period of organized commerce in dress, when the trade must both create and meet a demand, has one constant characteristic: it must change; and to serve this end producers of clothing have in the last hundred years drawn all branches of the cloth-making and allied trades into cooperation. This movement began in France, which has for centuries enjoyed a particular prestige in all that concerns feminine dress.

British producers of dress are now following the same method, which involves the close working of dress designers with spinners and weavers. The technique of designing for fabrics is intricate, as yarn suitable for one cannot be successfully woven into another. There are schools of instruction, and the successful designer is one who is thoroughly acquainted with the theory and practice of dyeing, spinning, and weaving.

#### Introduction of the Short Skirt

Since the French Revolution, changes of fashion have been dictated chiefly by leading dress-makers. Their power has naturally been principally exercised to secure prosperity for their trade, rather than for any aesthetic ends. Thus, when war broke out in August, 1914, women were wearing long, narrow (hobble) skirts. Early in 1915 the dressmaking dictators of Paris, afraid that women would buy fewer clothes in the interests of economy, introduced shorter and very wide skirts. The markets were flooded with these to such an extent that by 1916 a woman in a pre-war skirt found herself unpleasantly conspicuous in the street.

The great expansion of the ready-made clothing trade after the First Great War improved public taste, giving a certain self-confidence to the average woman in her ideas about clothes, and the big dressmaking groups have found their dictates ignored on occasion. Tight-lacing, boned collars, boned bodices, and other restricting features of dress never returned after 1918, though attempts were made from time to time to introduce them again, for the benefit of the manufacturers of the accessories which such styles demand. In 1930 ankle-length skirts for outdoor wear were launched on the fashion market; women would have nothing to do with them, though they accepted long-skirted evening dresses. Good

taste was still further stimulated in the public by the employment of recognized experts in the designing of Utility (*q.v.*) clothing during and after the Second Great War.

The influence of the films on women's dress is great; but, while the fashions worn by film-actors are extreme, economic and other reasons lead to their modification before they are offered to the public. The fashion press, an extremely popular form of reading, devotes itself principally to extreme modes. Its attraction, however, is comparable to that "window-shopping" which is a habit of many women with limited purses.

An admirable summary of fashion and its influences is Miss Thalassa Cruso's introduction to the London Museum catalogue, Costume Section. See Costume; Dressmaking; Shoe; Skirt, etc.

H. Pearl Adam

**MASCULINE FASHION.** Fashion in male attire is evolutionary rather than subject to external dictation, and the changes are therefore slower and less perceptible. The last radical change in W. Europe was that from knee breeches to trousers at the end of the 18th century. During the 19th century the skill of the English, and especially London, tailors in the making of suits from the heavier cloths demanded by the conditions of industrial urban life established an ascendancy and set the standard for Europe and America, and even for the Far East, where the wide adoption of European dress at the expense of traditional native costume was an indirect tribute to English tailoring. London still sets the standard, one of quality rather than fashion, and unconscious rather than deliberate.

The basis of men's wear has remained the same for 150 years: hat, overcoat, coat, waistcoat, trousers. The shapes have varied in detail, giving rise to such transient extravaganzas as the shepherd's-plaid trousers of the 1850s or the "Oxford bags" of the 1920s. Sometimes bright colours are favoured, sometimes the tendency is towards sombre hues. Commercial enterprise may popularise certain minor adjuncts, *e.g.* straw boaters, cummerbunds, spats, suede shoes, but cannot ensure their endurance. Other modifications have sometimes been introduced in emulation of the idiosyncrasies of a public or popular figure of the day (*e.g.* Beau Brummell, Lord Raglan, Edward VII, the duke of Windsor,

Anthony Eden), but such emulation has been both voluntary and capricious. The result of any attempt to impose a new fashion is well exemplified in the failure of the Sandringham (or Daily Mail) hat, introduced 1919-20. Masculine taste shrinks from sudden novelty. Such changes as occur have usually been first thoroughly established in less formal garb, such as sports wear or undress service uniform. For the rest, much depends on the materials and their price, but even more, in Great Britain, on masculine subservience to the unwritten canons, taboos, and prejudices of "good form," which even on such matters of sartorial etiquette as the avoidance of brown shoes with a navy blue suit or the disregard of the lowest waistcoat button is not to be lightly altered or transgressed.

#### Comfort and Informality

The general direction of evolution has been steadily towards greater informality and comfort. Thus the coat has gradually become a jacket, the vent at the back, which disappeared after the First Great War, marking the last vestige of tails; silk hat and bowler have given place to the soft felt hat—or to none; collars once high and stiff have become low and soft; the elaborate stock has become a simple knotted tie; boots have become shoes. A second tendency has been towards the elimination of social distinction in dress by the mass production of ready-made clothing.

In the matter of whiskers, beards, and moustaches, fashions have changed more swiftly and often inexplicably. But the beards grown during the Crimean war may be held responsible for those of two whole generations of Englishmen; Lincoln's goatee was widely copied in the U.S.A.; and at least two film actors, Chaplin and Colman, helped to establish moustache styles in two continents. Nevertheless, masculine independence is demonstrated in the fact that beards were never less worn in Great Britain than throughout the reign of George V, a popular, yet bearded monarch.

*Consult* Taste and Fashion, J. Laver, rev. edn. 1945.

Gordon Stowell

**Fashoda Incident.** Name given to an episode which occurred just after the British reconquest of the Sudan in 1898. A small French expedition under Major (afterwards General) Marchand made its way from the French Congo to Fashoda (now Kodok), occupying it on

Sept. 7, in spite of the fact that in 1895 the British government had given formal notice that the Nile valley was within its sphere of influence. Sir Herbert Kitchener, then sirdar, went at once to Fashoda and asked Marchand to withdraw. The French officer refused, but on Nov. 5, after further negotiations, his government ordered him to give up the post. By an agreement signed March 21, 1899, France undertook to withdraw from the Nile valley, and a new boundary between the areas protected by the two countries was outlined. The affair caused much excitement in both countries.

**Fast and Loose.** Dishonest game formerly much played by gipsies and tricksters, known also as prick the garter. The victim was invited to push a pin or bodkin through a folded belt so as to fix it to a table, but the folds were so disposed by the owner that on the ends being pulled it came free, and the stake was forfeit. From this came the expression "to play fast and loose," *i.e.* to repudiate expressed obligations which it is no longer convenient to acknowledge.

**Fast Castle.** Ruined fortress of Berwickshire, Scotland. It stands on a steep cliff about 3½ m. N.W. of St. Abb's Head, and was formerly a stronghold of some importance, though little now remains of the buildings. It was to Fast Castle that James VI of Scotland was to have been brought by the Gowrie conspirators, and it is described as Wolf's Crag by Scott in *The Bride of Lammermoor*.

**Fast Colours.** Broadly speaking, colours which behave satisfactorily in wear for a reasonable time—say, six months. Colours should be fast against sunlight and water, rubbing, the action of street mud, and of perspiration. Colours are frequently required to be fast against specific finishing or manufacturing processes, *e.g.* against milling and potting. See Dyes.

**Fasti** (Lat. *fas*, divine law). Latin word meaning lawful, applied to those days (*dies fasti*) in the year on which legal business could be done, as opposed to days on which it could not (*dies nefasti*). The word then came to mean a calendar. Such calendars were of two kinds: *Fasti diurni*, a calendar indicating religious festivals, market days, etc.; *Fasti annales*, a calendar giving the names of the magistrates for the year and the chief events.

**Fasting** (A.S. *faestan*, to hold fast, observe). Total or partial abstinence from all or special kinds

of food and drink. Such abstinence has been practised for religious or other reasons by people of all nations from early times. It has formed part of both pagan and Christian asceticism (*q.v.*), in a religious sense being enjoined or commended together with prayer and almsgiving, and regarded as a method of self-discipline which, controlling the animal appetites, enables the mind more clearly to apprehend spiritual truths.

The Mosaic law prescribed one great fast day in the year, the Day of Atonement or 10th day of the 7th month (Lev. 16); others were added in commemoration of events connected with the captivity (Zech. 8); and in the O.T. many instances are recorded of individual and communal fasting. The king of Nineveh, when Jonah prophesied its fall, proclaimed a general fast, and the city was spared (Jonah 3). In the N.T. Jesus Christ is represented not as enjoining His disciples to fast, but as teaching that, whenever fasting was undertaken, it was to be without ostentation and with purity of intention (Matt. 6). At the same time He indicated that it would be a duty after His departure (Matt. 9; homily On Fasting ii); and said of certain demons (Mark 9, A.V.): This kind can come forth by nothing but by prayer and fasting (R.V. omits "and fasting"). Fasting was recommended and practised by the apostles (Acts 13, 14; 2 Cor. 6, 11). In the early church fasts were kept on Wednesdays and Fridays, and during Lent.

#### The Rules in the Churches

Unlike the Roman Catholic Church, the Church of England makes no distinction between fasting and abstinence (*q.v.*). In the homily On Fasting, the custom is said to be of itself a thing merely indifferent. It is regarded not as a means of grace but as a preparation for the means of grace, and is voluntary, and the rule, obligatory among Roman Catholics, as to partaking of the Holy Communion fasting, is observed only among High Church Anglicans. The proclamation of 1548 for the abstaining from flesh in Lent time (2 and 3 Edward VI, c. 19) was issued for political and economic reasons. At the same time, the Book of Common Prayer enumerates as days of fasting or abstinence the 40 days of Lent, Ember days, Rogation days, all Fridays except Christmas Day, and the evens or vigils of certain festivals where these festivals do not fall on a Monday, Sunday never being a fast day.

The manner of fasting or abstinence is left to the individual.

In the Roman Catholic Church all baptized persons who have completed their 21st year are bound to observe the days of fasting, on which they may not eat more than one full meal, this meal to be without flesh meat, and to be eaten after mid-day. The days of fasting are all Lent, except Sundays, the Ember days, vigils of the more

tion of life under such conditions varies within wide limits. Instances are well authenticated of survival for upwards of forty days if water is freely taken. The lord mayor of Cork, Terence MacSwiney, in 1920 fasted in Brixton prison, dying, after abstaining from food for 73 days, on Oct. 25. After a prolonged fast the stomach is unable to exercise its functions normally, and at first very small quantities

of liquid and easily digested food should be given. Limited fasting forms part of many nature cures. See Hunger Strike; Starvation.

**Fastnet.** Rock off the S.W. coast of co. Cork, Eire. It has a lighthouse showing a flashing light visible for 18 m.

**Fat.** Chief constituent of fatty or adipose tissue, which is present to a varying extent in nearly all parts of

Fastnet, Eire. An air view, showing lighthouse (completed 1907) and base of an earlier, demolished lighthouse

solemn feasts, all Fridays except those falling within 12 days of Christmas, and between Easter and the Ascension. Fasting is exceptionally strict in the Eastern Church, in which 226 days are set apart for it in the year; it is an important religious duty among the Hindus; and among Mahomedans, who regard the practice as mitigating the penalties of sin, the month of Ramadan (*q.v.*) is a period in which fasting is obligatory. In ancient Greece rigid fasts preceded the solemnities of the Eleusinian mysteries; and in Rome every fifth year a general fast was held in honour of Ceres.

From a physiological or medical point of view, abstention from food leads to the tissues of the body being consumed in order to maintain the output of heat and energy. Hence, progressive emaciation occurs, absorption of the fat in the tissues being well marked. The face becomes pale, the cheeks sunken, and the eyes hollow. The abdomen sinks in and the bones become prominent. The temperature is often subnormal.

Towards the end, mental symptoms may appear and hallucinations may be followed by coma and death, the immediate cause of which appears to be reduction of the bodily temperature. The dura-

the body. Adipose tissue consists of a foundation of connective tissue in the meshes of which are the fat-cells containing an oily material which is a mixture of palmitin, stearin, and olein formed by combination of fatty acids with glycerol. Chemically, fat consists of carbon, oxygen, and hydrogen, and it provides a reserve of material which can be drawn upon to maintain the heat and energy of the body. See Obesity; also Fatty Acids; Fatty Oils, etc.

**Fatalism** (Lat. *fatum*, fate). View that all the events of human life are ordained beforehand by an absolute necessity. Such was the view of Epicurus and the Stoics, and it is held by Mahomedans at the present day. Fatalism differs from determinism, according to which events stand in a relation of cause and effect to other events immediately preceding, in that it asserts that, no matter how much the antecedent causes may be varied, it will not affect the pre-ordained result. See Free Will.

**Fata Morgana.** Form of mirage seen in the straits of Messina between Sicily and Calabria, supposed to be the work of a fata or fairy named Morgana. In this type of mirage, which is seen across calm water, inverted images of ships, etc., are seen in the air

above the real objects. The term is used to describe a mirage (*q.v.*).

**Fat Boy, THE.** Character in Dickens's *Pickwick Papers*. Page-boy to Mr. Wardle, Joe is enormously fat, given to somnolence, and often quoted for his desire to "make your flesh creep."

**Fatehganj.** A village of the United Provinces, India. In the district of Bareilly, it is 23 m. S.E. of Bareilly, and was founded to commemorate the British victory over the Rohillas in 1774. A few miles N.W. in the same district there is another village of this name, where the Rohillas were defeated by the British in 1796. Pop. 4,200, two-thirds Hindus.

**Fatehgarh.** Town of the United Provinces, India. The headquarters of Farukhabad district, it forms with Farukhabad city, 3 m. to the N.W., a single municipality. The fort near the Ganges was built in 1714 by Nawab Mahommed Khan. A monument commemorates the European residents who lost their lives in the Mutiny of 1857. *See* Farukhabad.

**Fatehpur.** Dist. and town of the United Provinces, India, in the Allahabad division. The area of the district, which lies between the Ganges and the Jumna, is 1,642 sq. m. Slightly more than half the district is under cultivation, the chief crops being gram, barley, wheat, rice, and cotton. Fatehpur town is on the E. Indian railway. Pop. dist., 806,944, 90 p.c. Hindus; town, 20,000.

A second town of the same name, which is situated in the Bara Banki district of the United Provinces, is noted for its old buildings, some of which tradition assigns to the 14th or 15th century. Pop. 7,100, three-fifths Mahomedans, two-fifths Hindus. A third town belongs to the Sikar chiefship in Jaipur state, Rajputana. It is 146 m. N.W. of Jaipur. Pop. 21,000, two-thirds Hindus, 30 p.c. Mahomedans.

**Fatehpur Sikri.** Town of the United Provinces, India. It is 23 m. W.S.W. of Agra city, and was founded in 1569 by the Mogul emperor, Akbar, to whom the saint Salim Chishti foretold the birth of a son (the emperor Jehangir). A wall nearly 5 m. long runs along three sides of Akbar's town. The modern town lies near the western end. Prominent among the buildings are the mosque with Salim Chishti's mausoleum in the quadrangle, the palace named after Akbar's Rajput wife, and his own palace and audience halls. Pop. 7,200, three-fifths Hindus.

**Fates.** In classical mythology, goddesses who presided over the destinies of men. By the Greeks they were called Moirai, by the Romans Parcae. They were three in number, and were daughters of Zeus and Themis, or daughters of Night and Erebus. Clotho, the youngest of the three sisters, held the distaff which spun the thread of life; Lachesis mixed good and evil fortune with it; Atropos cut the thread at the allotted moment. They were very powerful goddesses, with whose decrees even Zeus himself was unwilling to interfere. In art the Fates are generally represented as aged women, but sometimes as maidens of grave mien: Clotho with a distaff or book of fate; Lachesis pointing with a staff to a globe; Atropos with a pair of scissors or a pair of scales.

**Father.** Word common to most Indo-European languages, the forms of which differ slightly in accordance with phonetic laws. Originally denoting a male parent, then by extension a remoter relationship such as ancestor or forefather, it came to be applied to the inventor or first person prominent in any art or pursuit. Thus, the Greek historian Herodotus is popularly called the father of history. Father is also a term of respect, as conscript fathers for the senators of ancient Rome; father of his country for Cicero, Augustus, and other emperors; father Thames and father Tiber. Special applications are the Pilgrim fathers, the first settlers in North America; father of the house, he whose membership of the house of commons has been longest without a break; father of the chapel (*q.v.*). In theology, Father is used for the Supreme Being, the First Person of the Trinity; for a priest of the Roman Catholic Church; and for the earliest Christian writers. In Rome the father of the family had very wide powers over his children and household. *See* Family; Fathers of the Church; Patria Potestas.

**Fatherhood.** Theological term for one aspect of the relationship of God to the universe generally, and to man particularly. In most ancient religious systems the idea of paternity, usually associated with that of maternity, is connected with the Deity or the chief of the deities worshipped. In monotheistic systems the ideas of paternity and maternity are combined in one God who is the cause and progenitor of all existence.

In Christian theology the term father is applied to the First Person of the Trinity as expressing

both a special relationship to the Son and an attitude as Creator, sustainer, and chief benefactor of the human race. This aspect of God as the Father of His people was only gradually unfolded in the Hebrew Scriptures, and it was not until post-exilic days that the idea of a warrior king appears to have been superseded by that of a loving and merciful Father. The teaching of Christ developed the doctrine to a degree unknown before. He claimed to be in a special sense the Son of God, and in Him all Christians are the children of God by adoption and regeneration.

**Father Lasher.** A member of either of two species of fish, *Cottus bubalis* or *C. scorpius*, small sea fish of the order Scleroparici.

**Father of the Chapel.** Name given to one who presides over the meetings of employees in a printing or newspaper office. *See* Chapel.

**Fathers of the Church.** Term specially applied to early Christian writers pre-eminent for learning and sanctity, whose works are regarded as having authority next after that of the Bible. The name seems to have been generally accepted by the 4th century. It has, however, always been used rather loosely. Even writers like Origen, whose orthodoxy was open to dispute, have been included among those who are known as fathers of the church.

The prominent writers of the 1st century were known as the apostolic fathers from their personal association with the apostles, whose teachings they are held to reflect. The list of the church fathers has been held to include writers down to the 12th century; but in common practice it is restricted to those antecedent to S. Gregory the Great (A.D. 604) in the Western Church and to John of Damascus (A.D. 756) in the Eastern. Some authorities, however, regard S. Bernard of Clairvaux (d. 1153) as the last of the fathers.

The chief church fathers are usually divided as follows: *Doctors of the church*—Athanasius, Basil the Great, Gregory Nazianzus, Chrysostom, Ambrose, Augustine, Jerome, and Gregory the Great; *Ante-Nicene Fathers*—Justin Martyr, Clement of Alexandria, Origen, Tertullian, Irenaeus, Cyprian, Gregory Thaumaturgus; *Post-Nicene Fathers*—Eusebius, Cyril of Jerusalem, Gregory of Nyssa, Theodoret, Hilary of Poitiers, Hilary of Arles, Leo the Great, John of Damascus, and others. The Venerable Bede is included in the last category.

In the Roman Church, the fathers, in their testimony to the fundamental doctrines of the faith, are held to be without fault, and their teaching is to be accepted without question; but in details and method of teaching they are of varying authority and value. Among Protestants no such authority is assigned to them; but the general consensus of the fathers is regarded as of the highest importance as showing how the early Church understood the teaching of Christ and His Apostles. The writings of all the chief fathers of the Church are included in Migne's edition, in 387 large volumes, 1844-66; and most of them have been translated into English.

**Fathom.** Nautical measure 6 ft. in length. Cables, etc., are measured by the fathom, and lead lines are marked off in fathom spaces.

**Fatigue.** Condition produced by prolonged or excessive output of activity, due partly to consumption of the available energy-producing materials, and partly to the accumulation in the tissues of the waste products formed during these efforts. The physiology of fatigue in a single muscle can be studied graphically with the aid of the muscle-nerve preparation, obtained by dissecting out the gastrocnemius muscle from the leg of a frog with the nerve attached. In the living being, besides the changes in the muscles, the development of fatigue is increased by the exhaustion of the central nervous system which follows the accumulation of waste products in the blood. Mental or emotional fatigue, however real, can scarcely be measured, though it was studied in both Great Wars.

**Fatigue.** In metallurgy, term used to describe the effect on metals of repeated stresses. Metals possess easily measured limits of elasticity and strength and, under normal conditions, they will not fail unless these limits are exceeded. But if a much lower stress, about half the ultimate tensile stress, be applied repeatedly, either being reduced to zero or reversed between applications, the metal becomes fatigued and does eventually fail.

Failure starts at one or more points where stress becomes concentrated; these may be slag inclusions, tool marks, sharp fillets, oil holes, corrosion pits, etc. The hair-line crack proceeds along the amorphous material at the boundaries of the metallic grains or in slip bands. After some period, these fine cracks reduce the

effective cross-section of the article. An examination of the broken surface of such a failure shows two quite different areas; there is a portion comparatively smooth and discoloured, while the rest of the surface appears either fibrous or crystalline, because of the final tearing of the unaffected metal, which can no longer bear the load. This type of rapidly alternating stress is commonly met with in practice, so it is essential for the engineer to have a method of measuring the susceptibility to such stresses of different metals and alloys. A number of similar test pieces must be subjected to different stresses until fracture occurs or until the number of reversals exceeds ten millions, when the stress is assumed to be within the fatigue limit. Generally steels with a higher tensile stress have greater resistance to fatigue, but local concentrations of stress upset this relationship. Fatigue under conditions favouring metallic corrosion is usually more rapid than failure due to fatigue under normal conditions.

**Fatigue** (Fr. *fatiguer*, to weary). Military term applied to duties as distinct from the use of arms. Normally fatigues are duties performed by troops in connexion with administration of camps and barracks, and include carrying coal, loading baggage, cleansing surface drains and flushing latrines, sweeping yards, clearing snow, moving ammunition, carrying water, etc. Men engaged on fatigues are known as a working party. Fatigues form part of the punishment of men confined to barracks or undergoing detention.

**Fatima** (c. 606-632). Daughter of Mahomet by his first wife Kadijah. Born at Mecca, she was the prophet's favourite daughter, and was called by him one of the four perfect women in the world. She bore her husband Ali three sons, Al-Hassan, Al-Hussein, and Al-Muhsin. From the first two are descended the Fatimate caliphs of N. Africa and Syria.

Another Fatima was the heroine of Perrault's story of Bluebeard, where, as his seventh and last wife, she discovered the bodies of her predecessors. (See Bluebeard.) The name also occurs as that of an enchantress in the Arabian Nights story of Sindbad the sailor.

**Fatshan.** City of China, in the prov. of Kwangtung. It lies in the Si-Kiang and Pe-Kiang delta, 7 m. S.W. of Canton. It has iron and steel industries, and a trade in cereals, oil, timber, and cassia. At

Fatshan Creek, a number of Chinese junks were destroyed by British naval forces during the war of 1857. Pop. est. 400,000.

**Fatty Acids.** Series of monobasic acids with the general formula  $C_nH_{2n}O_2$ , so called because many of them occur in natural fats. (See Fatty Oils.) They are colourless liquids or solids, the lower members of the group possessing a sharp smell and sour taste. The formula given above requires the number of hydrogen atoms to be double the carbon atoms in each acid. The following is a list of fatty acids, arranged in order of their carbon atoms:

$CH_3O_2$	— Formic
$C_2H_4O_2$	— Acetic
$C_3H_6O_2$	— Propionic
$C_4H_8O_2$	— Butyric
$C_5H_{10}O_2$	— Isobutyric
$C_6H_{12}O_2$	— Valeric
$C_7H_{14}O_2$	— Isovaleric
$C_8H_{16}O_2$	— Methylthylacetic
$C_9H_{18}O_2$	— Trimethylacetic
$C_{10}H_{20}O_2$	— Caproic
$C_{11}H_{22}O_2$	— Oenanthylic
$C_{12}H_{24}O_2$	— Caprylic
$C_{13}H_{26}O_2$	— Pelargonic
$C_{14}H_{28}O_2$	— Capric
$C_{15}H_{30}O_2$	— Undecylic
$C_{16}H_{32}O_2$	— Lauric
$C_{17}H_{34}O_2$	— Tridecyllic
$C_{18}H_{36}O_2$	— Myristic
$C_{19}H_{38}O_2$	— Isocetic
$C_{20}H_{40}O_2$	— Palmitic
$C_{21}H_{42}O_2$	— Daturic
$C_{22}H_{44}O_2$	— Stearic
$C_{24}H_{48}O_2$	— Arachidic
$C_{26}H_{52}O_2$	— Behenic
$C_{28}H_{56}O_2$	— Lignoceric
$C_{30}H_{60}O_2$	— Carnaubic
$C_{32}H_{64}O_2$	— Hyaeinic
$C_{34}H_{68}O_2$	— Cerotic
$C_{36}H_{72}O_2$	— Melissic

The fatty acids may be roughly divided into two classes, liquid and solid. Those containing ten or more atoms of carbon are solids. All dissolve readily in alcohol and ether. The lower members of the series are soluble in water, but the solubility decreases as the number of carbon atoms increases. The acidity diminishes with the increase in the carbon atoms, this property being utilised in a process for separating the various acids. Another process of separation depends upon the progressive decrease in the solubility of the barium, magnesium, and lead salts. All the fatty acids, except formic and acetic, are oily or greasy. The boiling-point rises about 19° for each addition of CH in the formula, in acids from formic to capric. The melting points of the solids show a similar rise. The volatility of the acids decreases as the carbon atoms increase, so that lauric acid and those higher in the series can be distilled with-

out decomposition only under diminished pressure. The acids with an odd number of carbon atoms are comparatively rare.

**Fatty Compounds.** In organic chemistry, those in which the carbon atoms are connected together by a single linking. They are also known as saturated compounds because chemical changes are brought about by substituting one atom or group by other groups. Another series of organic compounds containing less hydrogen than the fatty compounds are known as unsaturated compounds, as they can combine directly with hydrogen or chlorine. The fatty acids belong to the group of fatty compounds.

**Fatty Degeneration.** Change in the cells of animal tissues in which the constituents of the cell become partly broken down into fat. It may be the result of various diseases, *e.g.* pernicious anaemia, or poisoning by certain substances, such as phosphorus or arsenic, or, more frequently, may follow lessening of the blood supply to an organ owing to narrowing of the arteries. The last is the usual cause of fatty degeneration of the heart.

**Fatty Oils** (formerly called fixed oils). Oils which, unlike hydrocarbon and essential oils, are not volatile without decomposition and cannot be distilled in steam from the raw materials in which they occur. On treatment with caustic alkali fatty oils, unlike others, form soaps. They are neutral bodies, and when pure are almost tasteless and odourless. Virtually insoluble in water and with the exception of castor oil, in cold alcohol, they are soluble in ether and petroleum spirit, and are mutually soluble, the one in the other. Since only fatty oils are digestible, they are the only fats to enter into human diet.

Chemically, fats and fatty oils are mixtures of mixed triglycerides, a triglyceride being a compound in which one molecular portion of glycerol is combined with three molecular portions of fatty acids, usually different ones. These acids are the saturated or unsaturated acids of the paraffin and allied series, and among the commonest are lauric, palmitic, stearic, and oleic acids. There is no chemical difference between a fat and a fatty oil, the term fat being reserved for such individual members as are solid, the term fatty oils for those which are liquid at ordinary temperature. The fat becomes fatty oil by heating, the change being reversed by cooling.

Fats occur throughout the tissues of animals and plants, form a homogeneous group, and are classified as follows: (a) animal fats, such as beef and mutton tallow and hog lard: these are derived from the fatty tissues of cattle, sheep, and pigs; (b) milk fats, such as butter fat and ghee: the former is derived mainly from the milk of the cow, the latter from that of the goat; (c) fish and marine animal oils: from the blubber of the large marine animals, such as the whale and the seal, from cod, herring, salmon, menhaden, and from the livers of halibut and cod; (d) vegetable oils and fats derived from fruit coatings and seeds of many plants and trees. The principal fruit coating fats are palm oil and olive oil, the principal vegetable seed oils being linseed, cottonseed, groundnut, soya, sunflower, rapeseed, coconut, with lesser amounts of palm kernels, sesame, hempseed, and castorseed. The oil content of these oilseeds varies: it is 63 per cent in the case of copra, 45 per cent in palm kernels, 15 per cent in soya beans.

World production of these fats and fatty oils is some 20 million tons a year, made up of three million tons of butter, four million tons of lard and tallow, 12½ million tons of vegetable fats and fatty oils, and 500,000 tons of marine animal and fish oils. Not all oil-bearing produce enters into world trade, a great deal being consumed in the countries of origin. This applies particularly to large quantities of soya beans, groundnuts, sunflower seed, sesame grown in China, to soya beans grown in Manchuria, to much of the oilseed crop in India, and notably to palm oil produced in W. Africa.

#### Countries of Origin

Soya beans are produced mainly in Manchuria, China, U.S.A.; cottonseed in U.S.A., Egypt, India, S. America, and Russia; linseed in U.S.A., Canada, India, Argentina; palm oil and palm kernels in W. Africa, Malaya, and the E. Indies; copra in India, Ceylon, Sumatra, Philippine Islands; sesame in India and China; groundnuts in China, W. Africa, India, U.S.A.; olives in Spain and other Mediterranean countries. Cod oil and cod liver oil come from Newfoundland and Norway; tallow from U.S.A., Argentina, Australia, New Zealand; while the main producing and exporting country of lard is the U.S.A.

Animal fats are produced generally by a process of rendering in

which the fatty material is heated in open kettles or closed autoclaves. Oilseeds and kernels, after shelling, crushing, grinding, and moulding of the resultant meal, are then subjected to hydraulic pressure between open plates or in enclosed cylindrical cage presses. A cold-pressed oil results; sometimes the residual cake is hot-pressed to remove further oil. The oil cake that remains, containing from 7 to 10 per cent of oil is used to feed cattle. Oils are also extracted from oilseeds and kernels by the use of a volatile solvent, preferably a petroleum fraction. In this case the residual meal may contain as little as 1 p.c. of oil; it is used in making compound feeding stuffs and in some cases as a fertiliser. However extracted, vegetable oils usually require filtering, refining, bleaching, and deodorising, particularly if they are to be eaten.

#### Uses of Fats and Fatty Oils

Fats and fatty oils are essential human food, the most important edible ones being: (1) butter, which exists in milk and is obtained by churning, and is usually taken raw; (2) lard, used in pastry and bread making and other cooking; (3) cacao butter, derived from the cacao bean and used in making chocolate and confectionery; (4) margarine (made from vegetable and whale oils), lard compounds, and shortenings; (5) vegetable oils (chiefly olive and cottonseed) used in frying.

Animal and vegetable fatty oils are used in soap making; hard soap is made by boiling tallow, palm oil, some hydrogenated fats, coconut oil, and such soft oils as cottonseed and soya bean oils along with resin and caustic soda. Soft soaps are made from linseed and cottonseed oils, caustic potash being used in place of caustic soda. In making hard soap, after removal of excess of alkali and separation of the soap, the resultant liquors contain weak glycerine, which is evaporated and refined to produce refined glycerine.

Fats can also be broken up into glycerine and their fatty acid constituents by treatment with super-heated steam, and in this way a better grade of crude glycerine is obtained, while the resultant fatty acids find an outlet in the candle, polish, and other industries. For the manufacture of toilet soaps and shaving soaps, high-grade tallow, bleached palm oil and coconut oil are preferred.

Linseed oil, China wood oil (Tung oil), perilla, and sometimes

soya bean oil are used in the making of paints and varnishes. These oils, usually termed drying oils, by absorption of atmospheric oxygen dry to a solid elastic skin; their drying is facilitated by first boiling the oils with small amounts of lead, manganese, and cobalt salts, known as driers. Rape or colza oil as an illuminant, though less common than formerly, is still important in regions of the world remote from supplies of kerosene, gas, or electricity. Oils from whale, seal, and cod are used in jute batching, in the treatment of textile fibres, and in leather dressing. Castor, cod liver, and chaulmoogra oils have long been valued for their medicinal properties; and castor oil is further of very considerable value in the manufacture of turkey red oil in the dyeing industry and as a lubricant in internal combustion engines. See *Essential Oils*; *Paint*; *Soap*, etc. Consult also *Oils, Fats, and Fatty Foods*, E. R. Bolton, 2nd edn., *Vegetable Oils and Oilseeds*, Imperial Economic Survey, 1938; *Utilisation of Fats*, H. K. Dean, 1938; *Industrial Fats and Waxes*, T. P. Hilditch, 2nd edn., 1941; *Review of the Oilseed, Oil, and Oilcake Markets*, Frank Fehr and Co., 1944.

H. M. Langton

**Faubourg**. French word for a suburb, e.g. the Faubourg St. Honoré in Paris. It comes from Latin words meaning outside the borough or burg, and in the days when cities had walls was given to suburbs outside them.

**Faucher**, LÉON JOSEPH (1803-54). French economist and politician. Born at Limoges, Sept. 8, 1803, he became prominent as a journalist, chiefly on *Le Temps* and *Le Courrier Français*, between 1830-42, making a close study of economic problems and exerting a moderating influence on the liberal factions. Elected a deputy in 1847, he was also returned to the constituent assembly of 1848 for the Marne dept. He was a strong advocate of free trade principles, influenced by a visit to England in 1843. Although minister of the interior in 1848-49, and again in 1851, his active political career was not successful, and he retired from public life in protest against the adoption of universal male suffrage in 1851. He was largely responsible for the foundation of the *Crédit Foncier* (q.v.) in 1852. He died Dec. 14, 1854.

**Fauchet**, CLAUDE (1744-93). French Revolutionist. Born at Dornes, Nièvre, Sept. 22, 1744, he

became a priest in Paris and tutor in a noble family. His preaching won fame for him, and after being dismissed from his position as court preacher he joined the Revolutionary party. He helped in the attack on the Bastille, and was afterwards a member of the legislative assembly and the national convention. He was made bishop of Calvados, but, ceasing to act with the advanced republicans, he was guillotined, Oct. 31, 1793.

**Faucille**, COL DE LA. Mt. and pass of France, in the dept. of Ain. They are in the Jura Mts., 16 m. N.W. of Geneva. On the summit of the mountain (4,355 ft.) are two hotels. The pass leads through the valley of the Dappes, which in 1862 was partitioned between France and Switzerland.

**Faucit**, HELENA SAVILLE (1820-98). British actress. She made her first London appearance at Covent Garden on Jan. 5, 1836, as Julia in Sheridan Knowles's *The Hunchback*, and achieved conspicuous success as Juliet, Portia, Constance, Desdemona, Imogen,

Helena Faucit, British actress

and Hermione. Macready engaged her as leading lady from 1837 at Covent Garden, The Haymarket, and Drury Lane. She acted Pauline to his Claude, Julie to his Richelieu, and Clara to his Alfred Evelyn, in the original production of Lytton's plays, *The Lady of Lyons*, *Richelieu*, and *Money*. In 1851 she married Sir Theodore Martin, who wrote her life, 1900. She died Oct. 31, 1898.

**Fauconberg**, BARON. English title dating from 1283 and now united with that of Conyers. Walter de Fauconberg, who was summoned to parliament as a baron in 1283, was the first holder, and the title passed to his descendants until it came in 1362 to Thomas, the 5th baron. He left an only daughter, Joan, who married Sir William Neville, and he, following the custom of the time, became Lord Fauconberg. He was made earl of Kent, but died without sons and from the time when his widow died (1491) to 1627 the barony was in abeyance. In that year Charles I gave Thomas Belayse the title of Baron Fauconberg, and in 1642 created him a viscount. To these titles his grandson Thomas succeeded in 1652. He was a parliamentarian and married Mary,

daughter of Oliver Cromwell. Afterwards he became a royalist and courtier under Charles II. He was made an earl in 1689 and died without sons in 1700. In 1903 the barony was granted to the countess of Yarborough, a descendant of Joan Neville.

**Fauldhouse**. Town of Scotland, in West Lothian. It is 7 m. S. of Bathgate and is served by two railway lines. Coal-mining, sand-quarrying, and the shale oil industry give employment. Pop. 4,941.

**Faulhaber**, MICHAEL VON (b. 1869). German prelate. This outstanding figure in the opposition of German clergy to the Nazi regime was born at Heidenfeld, Bavaria, March 5, 1869, and became a priest in 1892. He was professor at Strasburg university, 1903-11; bishop of Speyer, 1911-17; archbishop of Munich from 1917, cardinal from 1921. With historical learning and fearless spirit he early began to preach and write against Hitlerism, and his Christmas sermons of 1933-34, collected and published in many languages, became famous.

**Faulhorn**. Mt. of Switzerland, in the canton of Berne. It is in the Bernese Oberland, 32 m. S.E. of Berne, between the lake of Brienz and the Grindelwald valley. It is composed of calcareous, friable schist. Alt. 8,803 ft.

**Faulkner**, WILLIAM (b. 1897). American novelist. Born at New Albany, Mississippi, Sept. 25, 1897, he was educated at Mississippi university, and his first book, *The Marble Faun*, was published in 1924. Faulkner was strongly influenced by his southern environment; with many writers of his generation he was indebted to James Joyce, and his style was tortuous yet flexible. With *The Sound and The Fury*—considered his masterpiece—he established himself as one of the most important novelists of the American scene. Later novels, in which he used new methods of construction, included *Light in August*, 1932; *Absalom, Absalom*, 1936; *The Unvanquished*, 1938; *The Wild Palms*, 1939; *The Hamlet*, 1940; *Go Down, Moses*, 1942.

**Fault**. In geology, a fracture in the earth's crust along which the rocks on one side have been appreciably displaced relative to those

William Faulkner, American novelist

on the other. Faults are classified according either to their relation to the strata they traverse, or to the nature of the movement that has taken place. Thus dip-faults are parallel to the direction of dip of the strata which they cut; strike-faults are parallel to the strike or horizontal trend of the beds; and oblique-faults are between the two. The surfaces along which the movement has occurred are termed fault-planes; they are rarely vertical, and their inclination is measured either from the horizontal, when it is called the dip, or from the vertical, when it is called the hade. The upper surface of a fault-plane or zone is referred to as the hanging wall, and the lower as the foot-wall.

Where the rocks above the fault plane have moved downwards relative to those below it, the fault is said to be normal (Fig. 1). Where they moved upwards relatively, a reversed fault is produced (Fig. 2). When the inclination or dip of the plane becomes less than 45°, reverse faults are usually termed thrusts.

Many big thrusts occur on planes which dip very gently and may be slightly undulating; the Moine thrust in N.W. Scotland is a classical example. Relative movement between the rocks above and below big thrusts associated with mountain building movements may measure tens of miles (Fig. 4). Tear-faults are faults on which the movement has been dominantly horizontal (Fig. 3). Numerous examples occur in the Scottish Highlands, where the Great Glen Fault, from Inverness to Loch Linnhe, is considered to have had a movement of 64 miles, in which the N.W. side moved S.W. relative to the S.E. side. The vertical component of fault movement is called the throw of the fault; the horizontal component is the shift.

Sudden movement on a fault sets up vibrations in the earth's crust and produces earthquakes (*q.v.*). Actual displacement of the ground surface by faults has been observed, the cliff so formed being called a fault-scarp. More common is the production of a cliff or slope feature along the fault by the erosion of softer rocks which have been thrown against harder. This

produces a fault-line scarp. Because faulting breaks up the rocks they are easily eroded along lines of faults; in this way fault-line valleys, such as the Great Glen are produced. Rift valleys are fault features formed by the sinking of a strip of ground between two parallel faults. Where rocks are broken into more or less cemented fragments a crush-breccia is formed; if this is ground to a clay it is called gongle. Faults sometimes form passages for ascending mineralised solutions, and so become the locus of ore deposition. They commonly act as channels for water, and the springs which occur along fault lines are

**Fault.** Diagram illustrating various types of geological fault. 1. Normal or gravity strike-fault. 2. Reverse strike-fault. 3. Transcurrent or tear dip-fault. 4. Section across a typical zone of thrusting. The beds a and b have been pushed upward and from the left on three subparallel major thrusts (T), and on repeated minor thrusts (t). The zone of minor reverse faulting is called a zone of imbrication (i)

of value for water supply. See Dip; Earth-movement; Tectonics.

Gilbert Wilson, Ph. D.

**Faunus** (Lat. *favere*, to favour). In Roman mythology, originally an Italian nature god, whom rationalistic explanations made out to be a prehistoric king. He was the patron of agriculture and of flocks and herds, and had prophetic powers. As the god of flocks, he was known as Lupercus, and the Lupercalia (Feb. 15) was celebrated in his honour. The Faunalia (Dec. 5) was rather a local festival. In art he is represented as a bearded man, with goatskin cape, and bearing a club and a horn.

**Faure, François Félix** (1841-99). French statesman. Born in Paris, Jan. 30, 1841, he made a fortune as a shipowner in Havre. He fought as a volunteer officer in the war of 1870-71 against Prussia, and entered the chamber as republican deputy for Havre in 1881. His knowledge of commercial and colonial conditions made him prominent, and he was under-secretary for the colonies in Jules Ferry's ministry of 1883, and minister of marine in 1894. He was elected president of the re-

public after Casimir-Périer's resignation, Jan. 15, 1895, defeating Brisson by 69 votes. An unsuccessful attempt on his life was made, July 14, 1896. The chief events marking his tenure of office were the visit of the tsar of Russia and the conclusion of the Franco-Russian alliance, 1896, and the beginning of the Dreyfus affair, at a critical point in which Faure died suddenly, Feb. 16, 1899.

**Félix Faure.**  
French statesman

**Fauré, Gabriel Urbain** (1845-1924). French composer. Born at Pamiers, Ariège, May 13, 1845, he studied under Niedermeyer and Saint-Saëns in Paris. His first appointment was that of organist at S. Sauveur, Rennes; after holding similar posts in Paris, he became maître de chapelle at the Madeleine in 1896. During 1905-20 he was director of the Paris conservatoire. It was here that his work as a teacher was accomplished, his pupils including Nadia Boulanger and Maurice Ravel. Apart from his Requiem which must be accounted a masterpiece, Fauré's reputation rests upon his songs and chamber music. Among his lyrics are *Après un Rêve*, *En Prière*, *Les Roses d'Ispahan*, the collections *Le Jardin Clos* and *Mirages*, and his settings of Verlaine, notably *La Bonne Chanson*. His two sonatas for cello, trio for violin, cello, and pianoforte, quartet for strings, and two quintets for pianoforte and strings are standard works. He died in Paris, Nov. 4, 1924. There are studies by C. Koechlin, 1945; N. Suckling, 1946. *Pron.* Fo-ray.

**Faure, Jean Baptiste** (1830-1914). French singer. Born at Moulins, Jan. 15, 1830, he excelled in singing as a boy. After studying at the Conservatoire in Paris, he appeared at the Opéra Comique in 1852, and achieved success in opera in Paris, London, Vienna, Brussels. He died Nov. 19, 1914.

**Faust.** German scholar of the 16th century whose name has become the centre of a great body of legend and poetry in European literatures. There is good historical evidence for the existence of a real doctor of this name who, during the first half of the 15th century, practised magical arts, and gained wide notoriety as a clever charlatan, especially, it is

believed, at Cracow. The numerous stories popularly attached to his name were collected anonymously and published by Johann Spiess at Frankfurt in 1587 as *The History of Dr. Johann Faust*, a book which went through many editions, translations, and adaptations. In this work the essentials of the story are given as follows:

Faust, weary of the pursuit of learning and worldly pleasures alike, has taken up the study of magic and necromancy. He conjures the devil, who engages to serve him in all he may desire for a period of 24 years, after which he passes into the devil's power. The devil accordingly procures for Faust all sorts of pleasures and supernatural aids to his study of sorcery, alchemy, and philosophy. Faust has occasional fits of repentance, which pass as his servant provides fresh delights; among his lovers is Helen of Troy, a familiar medieval incarnation of pagan delights. When the appointed time expires, Faust dies in an agony of fear, and falls irrevocably into the devil's hands.

#### The Legend in Literature

The Tragical History of Dr. Faustus, the drama by Christopher Marlowe, published in 1604, is the first appearance of the story in serious literary form in England. It was derived from an English version of the Spiess publication, published probably about 1590. Faust is depicted as a young man, enjoying to the full his ill-gotten pleasures; and the devil, Mephistopheles, is a genuinely tragic figure, fallen from heaven and tortured by regret for his lost state. Helen of Troy is conjured up near the end of the tragedy, symbolising the return of ancient beauty in the Renaissance to challenge medieval doctrines.

The Faust of Goethe, the greatest version of all, is a long verse drama in two parts. Beginning in 1773, Goethe did not complete working on it until 1832, a few days before his death, but parts were published in 1790 and 1808. The story is developed on widely different lines from the early Faust books. Faust, inspired by a fierce desire for knowledge and for pleasure, and convinced of the unreality and uselessness of his life, sells himself to Mephistopheles. He seduces and deserts the beautiful Marguerite, who in despair kills her child and is thrown into prison. Faust visits her, and tries, in vain to persuade her to flee with him, but she dies in his arms. A voice from Heaven declares that

penitence has saved the soul which he had imperilled. This is the central episode in the story, but the Prologue in Heaven describes how the temptation of Faust is undertaken by Mephistopheles as a wager with God, who believes that Faust can withstand his seductions.

In Goethe's second part, the philosophic aspect forms the exclusive interest, and the symbolism is often very obscure. Faust comes to the conclusion that neither learning nor bodily pleasures can satisfy his soul, but only a life of useful activity, contributing to the beneficent works of God and Nature. By this decision his soul is saved from perdition. Goethe has thus transformed the old Faust story, with its stress on the punishment awaiting those who seek human and rational knowledge in preference to theological doctrine, into an expression of the noblest humanism in thought and action.

Faust has also been the subject of a romance by Friedrich Klinger, 1791, of a dramatic poem by Nikolaus Lenau, 1836, and used as the basis for operas by Spohr, 1818, Berlioz, 1846, and Gounod, 1859. A tragedy, Faust, by W. G. Wills, based on Goethe's version, was produced successfully by Henry Irving at the Lyceum, London, Dec. 19, 1885, revived in 1888, 1894, and 1902. In 1920 the original version of Goethe's Faust, found by Friedrich Schmidt in a contemporary manuscript copy, was produced in Berlin by Max Reinhardt. Dorothy L. Sayers's play, *The Devil to Pay*, 1939, also dealt with the legend. *Pron.* Fowst. See Goethe; Mephistopheles; Consult also Johann Faust, The Man and the Myth, H. G. Meek, 1930.

**Faustina** (d. A.D. 141). Wife of the Roman emperor Antoninus Pius. His daughter of the same name (d. A.D. 175) married Marcus Aurelius, successor of Antoninus. Mother and daughter were noted for their profligacy, yet their memory was held in honour after their death by their husbands, who founded institutions for the educating of orphan girls called after them *Faustinianae*.

**Faust Up to Date.** Burlesque written by George R. Sims and Henry Pettit, with music by Meyer Lutz, produced Oct. 30, 1888, at The Gaiety, London, where it ran for 180 performances.

**Fauvism.** Art movement. The term *fauve*, wild beast, was applied in derision to a group of expressionist painters who first exhibited in Paris in 1906. Reacting against

the limitations of neo-Impressionism and all attempts at naturalism in art, the leaders influenced many of the younger painters of the day. Its adherents included Matisse, Braque, Vlaminck, Dufy, Van Dongen, and Friesz. Their work was characterised by broad patterns of decorative colour used in large, unbroken areas chained by heavy outlines. In their revolt against academic influences the Fauvists turned to negro art.

**Fauxbourdon.** Musical term denoting a system of vocal harmony which in its simplest form consists of a chain of first inversions, beginning and ending with a chord in root position, i.e. bass, fifth, and octave.

**Favara.** Town of Sicily, in the prov. of Agrigento. It stands at an alt. of 1,100 ft., 5 m. S.E. of Agrigento and 9 m. from the Mediterranean. It is the centre of a fruit-producing district, and is noted for its rich sulphur mines; other products are marble, alum, and tourmaline. There is a 14th cent. castle of the Chiaramonti. Pop. 21,599.

**Favart, CHARLES SIMON** (1710-92). French dramatist. Born in Paris, Nov. 13, 1710, he produced his first light opera, *Les Deux Jumelles*, in 1734, with such success that he left his father's bakery business and turned to playwriting. Under his direction the Opéra Comique became the centre of this class of work for many years. A protégé of Madame de Pompadour, he scored other notable successes with *La Chércheuse d'Esprit*, 1741; *Les Moissonneurs*, 1747; *Les Trois Sultanes*, 1761. His wife, Marie Justine du Roncerai (1727-72), was a celebrated actress, whose coldness to the enamoured Marshal de Saxe, when the Favart company was performing in his camps in Flanders, 1747, brought his wrath on her, and a *lettre de cachet* on her husband, the execution of which he escaped. Favart died in Paris, May 12, 1792.

**Faversham.** Mun. bor. and market town of Kent, England. It stands on a branch of the Swale, called Faversham Creek, and is 9½ m. N.W. of Canterbury, with a railway station. In 1147 Stephen and Matilda founded here a Cluniac abbey, of which traces

Faversham arms

still exist. In it the royal pair and their son Eustace were buried. The cruciform church of S. Mary of Charity, in the Early English style,

restored by Sir G. G. Scott in 1874, contains some superb brasses.

Faversham has a trade in fruit, hops, and agricultural produce, also powder mills, brickworks, breweries, a canning factory, and an oyster industry. The port has a trade in coal, timber, etc. The corporation owns a recreation ground and cemetery. The town is a parl. div. of Kent. Owing to its position at the point where Watling Street touched the river, Faversham was probably an important place in Roman Britain, certainly in Anglo-Saxon times. It was a member of the Cinque Port of Dover, and was governed as now, by its own mayor and corporation, while its abbot was rich and powerful. Market days, Wed. and Sat. Pop. 12,000.

Faversham, Kent. The parish church of St. Mary of Charity, restored in 1874

**Favignana** (anc. *Aegusa*). Island of the Mediterranean, belonging to Italy. It lies off the N.W. coast of Sicily, and, covering 8 sq. m., is the largest of the Aegades Islands. Favignana, the chief town and fishing port, lies on the N. shore, and has a fortified harbour. Off the island the Carthaginian fleet was defeated by the Romans in 241 B.C. The island is 6 m. long, and rises over 1,000 ft. It is honeycombed with caves.

**Favonius**. In Roman mythology, the name of the W. or S.W. wind which blew in spring, identified with the Greek Zephyrus.

**Favorinus**. Greek sophist and rhetorician. A native of Arelatē (Arles) and a great traveller, he flourished during the reign of Hadrian. He wrote several miscellaneous works, but none survives.

**Favre**, JULES CLAUDE GABRIEL (1809-80). A French statesman. Born at Lyons, March 21, 1809, he entered the legal profession, and, an ardent republican from the first,

Jules Favre, French statesman

was elected deputy for Lyons to the constituent assembly, 1848. A bitter enemy of Louis Napoleon, he attempted an armed riot against his election to the

presidency, 1851; defended his assailant Orsini, 1858; led the republican opposition in the chamber, 1863-70; and founded the republican paper, *L'Electeur*, 1868.

In the government of national defence, 1870, Favre was foreign

minister and vice-president, but mismanaged the armistice negotiations, Jan. 28, 1871, and as foreign minister under Thiers, 1871, was easily out-manoeuvred by Bismarck. The treaty of Frankfurt brought about his resignation, July 23, 1871. He was elected to the senate in 1876, and died Jan. 20, 1880.

**Favus** (Lat., honeycomb). Disease caused by a parasitic fungus, of the genus *Achorion*, which most frequently attacks the scalp, but may affect any part of the skin. Favus is common in Eastern Europe and Asia, but is rare in Great Britain. On the scalp it first appears as small, irregular cups of a sulphur-yellow colour. Large scabs are gradually formed which eventually drop off, leaving a depressed scar destitute of hair. Favus of the nails somewhat resembles ringworm of the nails. The condition is intractable, and may persist for years. The contagion may be derived from rabbits, dogs, fowls, and other animals. Exposure of the patch to X-rays, followed by vigorous treatment with antiseptics, gives the best results.

**Fawcett**, HENRY (1833-84). A British politician. Born at Salisbury, Aug. 26, 1833, he graduated at Cambridge in 1856, distinguishing himself in mathematics. He was accidentally blinded at a shooting party in 1857, but, taking up his fellowship at Trinity Hall, devoted his time to the study of political economy, of which he became professor in 1863. In 1867 he married Millicent Garrett, a distinguished advocate of women's rights. In 1865 he became Liberal

M.P. for Brighton. Identifying himself with schemes of reform and devoting himself especially to all questions concerning India, he became known as the member for India. In 1875 he was elected M.P. for Hackney, and in 1880 became postmaster-general under Gladstone, but without a seat in the cabinet. He introduced several postal reforms. He died at Cambridge, Nov. 6, 1884. *Consult* Life, L. Stephen, 1885; A Beacon for the Blind, W. Holt, 1926.

**Fawcett**, DAME MILlicENT GARRETT (1847-1929). A British writer and feminist. Born June 11, 1847, at Aldeburgh, she was the sister of Elizabeth Garrett Anderson. In 1867 she married Henry Fawcett (*v.s.*). She became a leading advocate of women's suffrage as president of the national union of women's suffrage societies until 1919. Her two text-books, *Political Economy for Beginners*, 1870, and *Tales in Political Economy*,

Millicent Garrett Fawcett

1875, had great popularity. She wrote *Essays and Lectures*, jointly with Henry Fawcett, 1872; *Life of Queen Victoria*, 1895; *Women's Suffrage*, 1912; *What I Remember*, 1925. Created D.B.E. in 1925, she died Aug. 5, 1929.

**Fawcett**, PERCY HARRISON (1867-?). English explorer, born at Torquay, Aug. 31, 1867. He commanded a brigade of artillery in the First Great War. In 1922 he led an expedition into the unexplored heart of Brazil, and two years later made with his son a second journey to the district, being last heard of in 1925. Several expeditions went in search of Fawcett, and although he was generally presumed to be dead, reports were circulated for some years that he was living with the Anafuqua Indians. *Consult* Man Hunting in the Jungle, G. M. Dyott, 1930.

**Fawkes**, GUY (1570-1606). English conspirator, central figure in the Gunpowder Plot. Born at York, April 16, 1570, he served for some years with the Spanish armies in the Low Countries from 1593.

Henry Fawcett, British politician

In 1604 a small group of Roman Catholic zealots, finding that they had nothing to hope from the accession of James I, formed a plot for the overthrow of the government by blowing up king, ministers, and parliament together; in the resultant chaos, the Roman Catholics, headed by the conspirators, were themselves to seize the government. The secret, imparted to few—Catesby, Percy, Digby, Rookwood, and Tresham are the most familiar of the names of the plotters—was for a long time well kept. The design was to be carried out on the day of the assembling of parliament in Feb., 1605. But the meeting was adjourned till Oct., and finally till Nov. 5. The conspirators procured an adjoining house which gave them access to the chambers under the Parliament House, where gunpowder was stored, while the execution of the plot was entrusted to Fawkes.

#### Betrayal of the Plot

But at the critical moment a hint was conveyed by one of the conspirators, Francis Tresham, to Lord Montague, warning him to absent himself from the ceremony, since "this Parliament shall receive a terrible blow, and shall not know who hurts them." The meaning of the hint was unexpectedly elucidated; on the night of Nov. 4 Fawkes was found at his post, and was seized after a desperate resistance. The rest of the conspirators fled, but were hunted down and captured or slain. A full confession was extorted under torture from Fawkes, who, with the surviving conspirators, was executed, Jan. 31, 1606.

The share taken in the affair by the Jesuits is a matter of dispute, but two of them, Gerard and Garnet, the head of the order in England, certainly knew of the plot, though the latter is said to have received his information only under the seal of confession. The effect of the plot was to establish in the minds of the English people an unreasoning and persistent fear and hatred of the Roman Catholics; though none but a few desperate fanatics had been concerned.

**Fawn.** The young of a deer; strictly a calf, either buck or doe, of the first year. See Deer.

**Fayal** or **FAIAL.** Island of the Azores, belonging to Portugal. It lies W. of Pico and covers 65 sq. m. Almost wholly mountainous (highest point, 3,300 ft.), it is fertile, cereals, fruit, and vegetables being cultivated. The fig tree flourishes, and from its pith carvings are

made; lace is made from the agave. Basket-making is carried on, but the so-called Fayal wine was made in the neighbouring island of Pico. The capital and chief port is Horta. Following the agreement with Portugal, Oct. 12, 1943, whereby Great Britain was granted temporary facilities in the Azores, the R.A.F. maintained a radar station near Horta. That port was also used by the R.N. as a base for warships engaged in escort and anti-submarine duties in the Second Great War.

**Fayalite.** An orthorhombic mineral, silicate of iron ( $\text{Fe}_2\text{SiO}_4$ ). It is one of the end-members of the olivine group, ranging from pure forsterite,  $\text{Mg}_2\text{SiO}_4$ , to pure fayalite,  $\text{Fe}_2\text{SiO}_4$ . Fayalite has been suggested as the name to cover members of this series containing 10 p.c. of the forsterite molecule. See Olivine.

**Faye, HÉRVÉ AUGUSTE ÉTIENNE** (1814-1902). French astronomer, born at St. Benoît-du-Sault, Indre, Oct. 5, 1814. He was made professor of astronomy at Nancy in 1854, and in 1873 professor of astronomy and geodesy at the École Polytechnique in Paris. He discovered the comet named after him, Nov. 22, 1843. It has a period of  $7\frac{1}{2}$  years, and pursues the most nearly circular path of any known object of the kind. His name was associated with the cyclonic theory of sunspots, with the nature of, and velocities in, prominences. He died in Paris, July 4, 1902.

**Fayum** or **FAIYUM** (Coptic, lakeland). Prov. of Upper Egypt. It contains the districts of Etsa, Fayum, and Senures. The district of Fayum consists of a nearly circular basin, well irrigated and fertile, sunk below the level of the surrounding desert. In it are Lake Moeris and the town of Medinet-el-Fayum (pop. 63,703). The chief products are rice, cotton, flax, hemp, figs, olives, and oranges. The prov., which is watered by the Bahr Yusuf, an old Nile branch, abounds in ancient remains, its sites having been dug by Flinders Petrie between 1888-90. The area of the prov. is 670 sq. m. Pop. 602,122.

Its overflow was embanked by Amenemhat III, who built a funerary temple, known in ancient times as the Labyrinth, two colossal statues on limestone pedestals, and the Hawara pyramid. Adjacent Roman tombs have furnished many mummy-portraits. Senwosri II erected the Illahun pyramid. At Gurob pre-

cious papyri were recovered from mummy-wrappings; other papyrus collections have come from Arsinoë and elsewhere.

**Fazogli** or **FAZOKL.** Region of the Anglo-Egyptian Sudan. It is intersected by the Blue Nile and borders Abyssinia on the S. and E. The inhabitants are negroes, but there are Arab settlements. The chief town is Famaka. Gold, ivory, gum, and fruits are exported, and tobacco and durra are produced.

**Feale.** River of Eire. Rising in N.W. co. Cork, it passes N.W. between cos. Limerick and Kerry and thence W. through Kerry to the Shannon, which it enters as the Casheen. Its length is 37 m.

**Faalty** (Lat., *fidelitas*, faith). Feudal vassal's fidelity to his lord. Under the feudal system the oath of fealty was taken by every tenant or vassal and bound him to be faithful to his lord. It corresponded to the oath of allegiance taken to the king. After the break-up of the feudal system fealty was often commuted for a money payment. Fealty was abolished in 1922.

**Fear** (A.S. *fæor*). An emotion roused by the presence or expectation of danger. In animals it prompts to immobility, flight, or attack; in reasonable men, to conduct which will remove the source of fear. In its extreme form—panic—reason loses control and blind instinct sweeps over all, in which state men will rush into situations of greater danger. In the form known as anxiety, fear is the most important of all emotional forces, far-reaching and devastating. Fear of doing wrong, of disapproval and punishment, human or divine, are the strongest instigators of moral conduct. On the other hand strong fear clouds judgement and produces morbid consciences and irrational feelings of guilt, while fear for personal safety is the cause of many crimes. If prolonged and acute, anxiety may become unbearable and must be repressed. When this occurs it accumulates in the unconscious and gives rise to morbid states which vary between physical illness, a chronic tendency to worry, and neurosis.

Fear is attended by marked physical reactions. Adrenalin is poured into the blood, the action of the heart is quickened, and blood may rush to it with such violence as to cause death, the hair rises; the subject sweats, stares, and pants; sight and hearing become more acute. See Emotion.

**Fear.** A cape or headland of North Carolina, U.S.A. Extreme S. point of Smith's Island and of the state. It has a lighthouse.

**Fearon,** P. H. British cartoonist, whose career is described under Poy, his pseudonym.

**Feast.** Term applied to days on which notable events in Church history, giving occasion for solemn joy, are commemorated. An Act of Edward VI prescribed certain days only to be kept as feast days, and a list of those now observed appears in the Prayer Book. From this has developed the use of the word for occasions of rejoicing in public or private; for public dinners, *e.g.* mayoral or civic feast, etc. Certain feast days, *e.g.* Michaelmas, are used in connexion with tenancy and other agreements. *See* Easter.

**Feather.** Outgrowth of the skin in birds. In the developing bird embryo the skin is thrown into folds which run in certain patterns. These folds become interrupted, but at the points where they persist growth continues and produces series of thimble-like outgrowths (Fig. 1), the pterylae or rows of feathers. The individual outgrowths are the

Feather. 1. Thimble-like outgrowths from which feathers grow

feather-germs. These thimbles of ectoderm placed upon fingers of mesoderm produce the feathers by simple direct growth. Each sinks from the surface and comes to occupy the bottom of a depression called the follicle (Fig. 2). Growth of the bottom of the thimble pushes out a hollow cylinder of ectoderm, the mesodermal core dying away at its tip as growth proceeds. Upon the inner side of this hollow cylinder there develop pleats like those in a kilt. These all begin on the side of the cylinder towards the rear of the bird.

As this side is beneath the anterior side because the feather slopes backward, it is called the

Feather. 2. The bottom of the follicle

ventral side; that opposite is the dorsal side. As growth continues, these pleats do not run straight down the cylinder, but take on a half-spiral form. Each just fails to reach its opposite number on the dorsal side. The strip running down the dorsal

Feather. 3. The definitive feather. B (1-17), barbs of definitive feather vane, serially numbered in order of development; C, collar; IU interior umbilicus; R, rachis of definitive feather; V, ventral

side where the pleats fail to meet is called the rachis or central rib of the feather. The pleats are called the barbs. All the ectodermal cells concerned in this process become loaded with keratin or horn and die. The cylinder splits down the ventral side and the dead horny structure opens out as the definitive feather (Fig. 3). The barbs are held together by barbules in the form of hooks and troughs indicated in Fig. 4.

In the peacock and some other birds some of the backs of these barbules are iridescent. In most birds which are not white the cells out of which the feather is made become loaded with melanin, a colouring matter supplied to them in grains by special cells. The production or supply of these grains is in many forms affected by the sexual hormone of the female, though not by that of the male. This accounts for some of the differences in colour between

Feather. 4. The barbs held together by barbules in the form of hooks and troughs. B, barbs; R, rachis

the sexes in birds. If female hormone is given to a brown Leghorn capon the breast feathers growing at that time are coloured in the light female way instead of the dark male way. A small dose gives a short duration of the effect and so a narrow bar of female colour (Fig. 5).

Feather. 5. Narrow bar of "female" colour

Feathers are also usually coloured by carotene pigments. A few parrots have a yellow pigment that fluoresces in ultra-violet light, so that they look uncannily bright. Plant-eaters (*g.v.*) have a pigment which, being water-soluble, washes out in heavy rain. Budgerigars exhibit the Tyndall effect having black cores to the barbs which absorb the long wave light while the short wave light is scattered back by the keratin, which has variations of refractive index in it and encloses air of a refractive index different from that of any keratin. The resulting colour is blue or green. White feathers are white as a limiting case of this scattering effect.

**Feather.** Term used in connexion with the adjusting of an oar, ship's propeller, or airscrew so that it offers the minimum resistance to water or air. In rowing, feathering is done by turning the blade of the oar horizontally as it leaves the water. The blades of a ship's propeller are so feathered or set in the boss that they offer the minimum resistance to the water as the leading edge of the blade moves forward with the revolution of the shaft, but exert the maximum grip in the water; the trailing edge of the blade is set so that the water slips off the blade with the minimum of resistance. On paddle-steamers the float boards of the paddles are feathered by fitting them so that they turn on an axis to present their broad side to the water at their lowest submergence, but turn their edge to the water on entering or emerging.

Airscrews are feathered to overcome the phenomenon that a propeller does not pull an aeroplane along equally well at all heights. If it is most efficient at 1,000 ft., its thrust will be much less at

30,000 ft. The feathering or variable pitch airscrew enables the angles of the blade to be altered in relation to the axis of the propeller boss while the aircraft is in flight and so maintain maximum thrust. A feathering airscrew enables the pilot to get the maximum pull from the airscrew when taking off. In aeronautics, feathering is akin to gear-changing on a motor car, enabling the aircraft to make the best use of its propeller at varying speeds and heights. In certain feathering airscrews the alteration in the pitch of the blades is effected automatically by the engine in conjunction with a governor; in other types a small reversible electric motor is fitted into the propeller boss, the degree of feathering, or pitch variation, being indicated by a dial on the instrument panel. *See* Airscrew.

**Feather.** River of California, U.S.A. Rising in many headstreams in the Sierra Nevada range, it flows S.W. and S. to the Sacramento river about 15 m. above Sacramento city. Over 230 m. long, it is navigable for 30 m. It was in the "gold rush" area, 1849.

**Feather Grass** (*Stipa pennata*). Perennial grass of the family Gramineae. A native of Europe, it was long cultivated in gardens as an ornamental plant. The glume containing the seed is covered with stiff hairs pointing upwards, whilst its base terminates in a sharp point. Above it is continued as a long, spirally twisted awn, ending in a long feather-like tail. The wind acting on the glume detaches the seed, etc. from the plant, and when it reaches the earth the spiral, by expanding in dry and contracting in wet weather, forces the seed into the ground, the bristles on the glume allowing it to enter but preventing its return. If these seeds get into the fleece of sheep they are driven by the same mechanism into the flesh of the animal. Two allied species, *S. capillata* (Russia) and *S. spartea* (N. America), are known to kill sheep in this manner.

**Feather Star.** Class of the Echinodermata (*q.v.*), otherwise known as sea lilies. They resemble very slender starfish, with long rays bearing little branches or pinnules, somewhat like feathers. They live in deep water. Only one species, the rosy feather star, occurs around the British coasts. *See* Crinoidea.

**Featherstone.** Urban district and parish of the West Riding of Yorkshire. It is 2 m. W. of Pontefract, with a rly. station, and is a

coal mining centre. The place is specially known because, during a strike, there was a riot here, Sept. 7, 1893. Colliery works having been destroyed, the military arrived, and order was not restored without bloodshed. Pop. 14,952.

**Featherweight.** Literally a weight absolutely exact, so much so that the addition of a feather would make it wrong. The term is used in racing for the lightest weight that can be carried by a horse in a handicap race. In boxing it refers to the lightest class but two of competitors in a recognized competition; a featherweight boxer must not exceed 126 lb. in weight. *See* Boxing.

**Febrifuge** (Lat. *febris*, fever; *fugare*, to put to flight). Term used for any medicine that lessens fever. Antipyrin and phenacetin are febrifuges, as are substances that induce sweating. Fever is now recognized as often a beneficial reaction to invasion of disease, and is allowed to run its course. If it is too high, cool sponging is preferable to drugs.

**Febris.** In Roman mythology, the personification of fever, also the goddess who was supposed to avert it. Three temples in Rome, one on the Palatine, were sacred to her.

**Febronianism.** Reform movement among the Roman Catholics of Germany. It was started in 1763 by Johann von Hontheim, who wrote under the name of Justinus Febronius. Its object was to limit the autocratic power of the pope and to secure a larger measure of independence for national churches.

**February.** Second month of the Christian calendar, ordinarily consisting of 28 days, but in leap year of 29. The name comes from Latin *februare*, to purify, in allusion to the Lupercalia (*q.v.*), the Roman expiatory festival, which, as well as the Feralia, or general festival of the dead, was celebrated in Rome during this month. The month is popularly known as

February "fill-dyke," referring to the melting of the winter snows. January and February were additions to the old Roman calendar. *See* Calendar.

**Fécamp.** Town and seaport of Normandy, in the dept. of Seine-Inférieure, France. It stands on the English Channel, at the mouth of the river Fécamp, 28 m. N.N.E. of Havre. The port, which has a harbour and docks, has a trade in coal, timber, etc.; it is also a fishing centre. There are some industries, mainly shipbuilding, and here is made the liqueur called benedictine. A commercial broadcasting station before the Second Great War attracted British listeners.

The most interesting building is the church of the Trinity, built in the 12th century, once the abbey church. A magnificent building, it has a spacious and noble interior, fine memorials and decorations, tombs, stained glass, etc. S. Étienne is a 16th century church, while the remaining monastic buildings are now used for the town hall, library, and museum. The town grew up around a nunnery founded in the 7th century to hold a relic of the True Blood, which was washed ashore in the trunk of a fig tree. The name may be a corruption of *fleus campus*. Pop. 16,876.

**Fechner, GUSTAV THEODOR** (1801-87). German philosopher. Born near Muskau, Prussia, April 19, 1801, he was professor of physics and afterwards of philosophy in the university of Leipzig. The founder of psychophysicism, he held that all mental changes were accompanied by a parallel change in the nervous system. His chief scientific works are *The Supreme Good*, 1846, and *Elements of Psychophysics*, 1860. Fechner was also the author of satirical writings under the name of Dr. Mises. He died Nov. 18, 1887. *See* Psychophysics.

Gustave Fechner, German philosopher

Feather Star. Specimen of rosy feather star, *Antedon bifida*

**Fechter, CHARLES ALBERT** (1821-79). British-French actor. Born in London, Oct. 23, 1824, he was a sculptor before he went on the French stage in 1844. He soon became recognized as the leading French *jeune premier*, notably by his Armand Duval in Dumas fils' *La Dame aux Camélias*, 1852. He appeared at The Princess's, London, Oct. 27, 1860, as Ruy Blas in

a version of Hugo's play, with great success. His Hamlet was enthusiastically received; but his Othello proved disappointing. Lessee of The Lyceum, 1863-67, he played in melodramas, such as The Corsican Brothers. He finally left England in 1872, remaining in America until his death, Aug. 5, 1879. It was Fechter who presented Charles Dickens with the chalet at Gad's Hill in which much of the novelist's last work was done.

*John Fechter*

**Feckenham, JOHN** (c. 1515-84). An English ecclesiastic. Born at Feckenham, near Droitwich, he became a Benedictine monk at Evesham, and then was rector of Solihull. He was confined in the Tower by Cranmer, 1549-53. When Mary restored the monastery of S. Peter at Westminster, he was chosen abbot. At the accession of Elizabeth he refused to acquiesce in the reformation of the Church, opposing the new liturgy and the Act of Uniformity, 1559. The monastery was later dissolved and Feckenham lived in confinement at London and Wisbech until his death, Oct. 16, 1584.

**Feddān.** Modern Egyptian land measure. The feddan is 1.038 acres, but in certain localities it is equivalent to 1.127 acres, whilst formerly it equalled as much as 1.266 acres. The measure is divided into 24 kirats.

**Federal Bureau of Investigation.** Detective service of the United States department of justice established in 1908 for investigating violations of the law. The F.B.I. is concerned with crime as it affects the U.S.A. as a whole, as distinct from individual state offences which are the responsibility of the local police. It is the authority in enforcing the laws relating to white slave traffic, theft of motor vehicles, blackmail, racketeering, and kidnapping. During the Second Great War the F.B.I. was responsible for counter-espionage, combating sabotage, and coordinating the search for escaped prisoners of war. It maintains forensic laboratories and an identification department with some 100,000,000 fingerprints, normally added to at the rate of 7,000,000 a year. The investigating staff of the bureau are popularly known as G-men (*q.v.*).

**Federalism** (Lat. *foedus*, a league). Form of government. The federal form of government involves limitations upon the power of the central government of a sovereign state, and fairly large units of subordinate government. Thus a federal state is distinguished from a confederation of states in having a powerful, though limited, central government; and federal units are distinguished from units of local government in being large and controlling elements in the governmental organism.

Federation means either the character of the government in a federal state, or the political movement towards decentralisation; and thus it may be best explained by reference to the practice of federal governments. Such governments may be formed either by the unification of diverse units, as in Switzerland and the original United States of North America, or by decentralisation of a single unit of government, as in Canada. The federal states of South and Central America vaguely reflect both methods of formation.

The subordinate elements in a federation are sometimes called states, as in N. and S. America, and sometimes called by other names, e.g. cantons in Switzerland. The idea of subordination, however, is not quite adequate, for the distinction between the functions of central and non-central government in a federal state is not one between a superior and an inferior. The distinction is based on a division between equally important functions.

The non-central governments generally deal with industrial issues of a localised character, with education, with taxation or a large part of it, with roads and summary justice; the central governments deal with peace and war, foreign or international affairs, basic administration of justice, and communication. Clearly the way in which the functions are divided must vary with the peculiar circumstances or the history of the people concerned, and where there is an increase of governmental functions there may be disputes as to the competence in particular issues of the central and the non-central governments.

**Bibliography.** History of Federal Government, E. A. Freeman, 1863; Federation in Central and Eastern Europe, R. R. Schlesinger, 1946.

**Federalists.** American political party formed in 1787. When the thirteen British colonies of N. America were recognized as an in-

dependent nation in 1783, the most urgent problem before them was the provision of a common central government which at the same time should not interfere with the autonomy of the several states. The practical result was that politicians were grouped into two parties with an indefinite line of demarcation—the Federalists, who emphasised the necessity for strengthening the authority of the central government, and the anti-Federalists, who emphasised the rights of the individual states. Since the individual interests of the northern states clashed with the individual interests of the southern states, while if representation rested upon population and wealth the north would dominate the central government, the northern politicians became roughly identified with the Federalists, the southern with the anti-Federalists.

Washington, as president, did not wish to identify himself with a party; Hamilton, the leading Federalist, and Jefferson, a prominent anti-Federalist, served under him in the same government. But at bottom the real question was whether the interests of the N. or those of the S. should predominate. The series of presidents from Jefferson onwards were anti-Federalists—mainly a consequence of want of solidarity among the Federalists and of the popular anti-British policy of the anti-Federalist statesmen. The Federalist party broke up and disappeared after the "Hartford Convention," which was held by the Federalist states of New England in 1814, with the somewhat paradoxical aim of organizing defence against encroachments upon the rights of the northern states, while it was strongly suspected of aiming at the separation of the New England states. See United States: History.

**Federal Reserve.** Banking system of the U.S.A. Each of 12 Federal Reserve banks established in 1913 under control of the F.R. Board acts in the separate district assigned to it as a central bank; thus together the banks maintain the ultimate reserves of the majority of the 15,000 separate banks which serve the U.S.A. and coordinate the operations, within limits, of commercial, state, and national banks. They are bankers also to the government, which appoints members to the central board; issue legal tender notes, which circulate along with those issued by the U.S. treasury; and by means of their lending facilities do much to ensure the stability

of the U.S. banking system, especially in times of crisis. Reserve banks must maintain reserves of 35 p.c. in lawful money against their deposits and 40 p.c. in gold against notes.

**Federal Union.** Name given to a movement to establish a federation among the democratic countries of the world as a preliminary to a world federation. A society was established in London in 1939 under this name. It was proposed to form a federation of Great Britain, the U.S.A., France, Belgium, the Netherlands, Sweden, Norway, Denmark, Finland, Switzerland, Canada, Australia, South Africa, New Zealand, and Eire. The union was to have a constitution modelled on that of the U.S.A., constituent states retaining a considerable measure of autonomy. Clarence K. Streit, president of Federal Union, Inc., was the principal publicist of the movement.

**Federated Malay States.** Name formerly given to a federation of native states of Malaya. See Malaya, Federation of.

**Federation of British Industries.** A British association of manufacturers, founded in 1916 and incorporated by royal Charter in 1923. Its purpose is to formulate and voice considered views on matters of industrial policy; and to assist in day-to-day problems affecting the production and sale of British manufactured goods. The F.B.I. represents some 250 trade associations and 4,500 individual firms, and has district offices in all parts of the Empire and many foreign countries. The headquarters are at 21, Tothill Street, Westminster S.W.1

**Fee.** Payment made for services, especially of a professional kind. The fees of doctors, lawyers, architects, and others are usually settled by custom, although as regards solicitors a maximum scale of fees is fixed by the Law Society. The fees of barristers, being originally honoraria, are not recoverable in a court of law. Fees vary considerably, more especially those of medical men and lawyers. Those of architects, surveyors, and the like are generally arranged on a percentage basis. The charge made for entrance to societies, clubs, etc., also the right to sit at examinations, is called a fee, as is the terminal payment to an educational establishment. See also Fee Simple.

**Feed.** Mechanical device for automatically conveying materials to a machine, fuel to an engine, or ammunition to a gun. Typical

feeds to a machine are the shuttles used in mechanical weaving, the rollers carrying metal strip to stamping machines such as those used for making coins and buttons, and the paper reels which feed printing presses. Fuel feeds include the pump which conveys petrol from the tank to the carburettor of an internal combustion engine, and the mechanical stoker which conveys solid fuel to a furnace. Ammunition feeds on heavy artillery usually consist of a tray which, lying below and to the rear of the breach, receives the shell and is then mechanically raised so that a hydraulic rammer can push the rounds into the breach. Automatic weapons of the Vickers machine-gun type are fed by a belt which, actuated by the recoil mechanism of the gun, carries the rounds into the breach. Guns of the Bren and Sten type are fed from fixed magazines, a spring in the base of the magazine feeding the rounds into the breach.

**Feeder.** Conductor which carries an electric current from one point to another; from generating station to sub-station, or sub-station to distribution centre or consumer; usually without intermediate connexions, in which it differs from a distributor cable which has service connexions tapped off.

**Feeding Stuffs.** Foods for farm livestock. They can conveniently be classed as: *coarse fodders*, which include hay, straw, and chaff, all bulky materials characterised by a high proportion of indigestible fibre; *green fodders*, e.g. grass, lucerne, sainfoin, clovers, vetches, marrow-stem kale, green maize, rape, and mustard; *succulent foods* including turnips, swedes, mangolds, and potatoes, which contain a high proportion of water and a low amount of fibre—dry matter in the succulent foods varies from about 25 p.c. in sugar beet to 9 p.c. in some turnips, almost two-thirds of it in the form of readily digestible sugar; *concentrated foods*, so called because they contain a high feeding value in a much smaller bulk than in the previous classes of foods. A series of *special feeding stuffs*, yeast, dried blood, meat meal, etc., is used for feeding swine.

The manner in which feeding stuffs of all description are utilised in practice is determined by their chemical composition, their digestibility, and the peculiar requirements of the animal to which they are fed. Thus, apart from the maintenance of the heat and

functions of the different organs of the body and the repair of tissues thereby involved—a requirement common to all animals—the use of every food is based on its value for beef production, milk production, the fattening of sheep, lambs, and swine, and the extent to which it supplies vitamins and, finally, mineral ash.

Coarse fodders may be regarded as sources of maintenance requirements; they also furnish the bulkiness without which the stomach is not sufficiently distended to promote the easy flow of gastric juices. Green fodders supply a readily digested proportion of carbohydrate matter and water in a form especially valuable to milch cows. Concentrated foods individually supply the three essential food constituents, protein, fat, and carbohydrates, in a relatively small bulk. Linseed cake and cotton cake contain each about 10 p.c. oil and respectively 30 and 40 p.c. protein. Leguminous seeds which, unlike the two cakes just mentioned, are used without previous processing for the extraction of oil, all possess a fairly high protein content but are low in oil and high in carbohydrates. Soya bean is an exceptional seed, rich in both protein and oil, the figures of which are 33 and 18 p.c. respectively. Of the cereals, wheat and barley contain approximately half as much protein as is found in peas and beans; they are low in oil but rich in carbohydrates. Oats (unhusked) contain as much protein as wheat and barley but much more oil and less carbohydrates. Despite the high proportion of fibre in oats, they constitute one of the best balanced foods for all classes of livestock. Maize contains more oil than wheat or barley and about the same amount of protein, but is distinctly low in ash.

**LAWS OF SALE.** Under the Fertilisers and Feeding Stuffs Act, 1926, and regulations made thereunder, every person who sells as a fertiliser for the soil or as food for cattle or poultry any of the articles set out in the Act must supply the purchaser with a statement in writing containing the name under which the article is being sold, particulars as to its nature, substance, and quality and (for feeding stuffs) whether it contains certain specified ingredients. In certain cases this does not apply to sales in quantities of 56 lb. or less. The seller warrants that the particulars in the written statement are correct and when

certain feeding stuffs are sold for use as food for cattle or poultry further warrants that the stuff is suitable for that purpose. If either of these warranties is broken the seller may be sued for damages.

**Feeling** (A.S. *felan*, to feel). Term used in various senses in psychology; especially for that aspect of the mind which includes pain and pleasure, tension and relaxation, and the emotions. In this sense feeling is contrasted with knowing (cognition) and desiring, willing, and striving (conation). To distinguish feelings from sensations, they are usually described in psychology by the term affects.

All animals possess a tendency to seek pleasure and avoid pain, to relieve tension, and to feel elated by success and depressed or angered by failure. The primitive effects are, therefore, held to be exhilaration, ease, distress, anger, and depression. As mental life develops a great variety of emotions appear. The chief function of affective states is to modify the response of the organism to stimuli from the outer world or the bodily organs; e.g. disgust affects appetite. The chances of survival both of individuals and groups are directly related to the degree to which affects are adjusted to external reality and encourage suitable behaviour. Inappropriate, exaggerated, or deficient affects are a marked feature in mental disease.

**Fee Simple** (Lat. *feodum simplex*). Highest estate known to English law. A tenant in fee simple is what is popularly styled a freeholder. Though in theory the sovereign is the lord paramount, the freeholder can grant his land away or devise it to whomsoever he likes by will. It is presumed that any grant of land is of the fee simple. See Land Laws.

**Fee Tail** (Lat. *feodum talliatum*, limited). Form of freehold estate set up originally by the Statute De Donis, 1285, by which a grant to X and the heirs of his body gave X an estate tail. This estate would last only as long as X had heirs of his body, and would then revert to the grantor. This led to Fines and Recoveries, tortuous legal fictions by which the estate became fee simple. In 1833 a new Act was passed by which, by a deed enrolled, X could convert his holding into a fee simple. In 1926 a fee tail became an equitable interest. See Enail.

**Fehling's Solution**. Alkaline solution of copper used for the detection of sugars. Solution No. 1

is prepared by dissolving 34.65 grams of pure copper sulphate in distilled water and diluting to 500 c.c. Solution No. 2 is made by dissolving 50 grams of sodium hydroxide containing not less than 97 p.c. of the salt, and 175 grams of recrystallised Rochelle salt in about 400 c.c. of water, and afterwards diluting to 500 c.c. When required for use equal volumes are mixed together.

**Fehmarn** OR FEMARN. Island in the Baltic Sea, part of Germany. In area 71 sq. m., it lies off the E. coast of Holstein, from which it is separated by the narrow Sound of Fehmarn and from the Danish island of Maribo on the N. by the Fehmarn Belt. The surface is level and the soil fairly fertile. Its few harbours accommodate vessels of shallow draught. Agriculture, fishing, and the rearing of cattle and sheep are the main occupations. The only manufacture of importance is hosiery. The capital is Burg. Prussia annexed the island in 1866 as a result of her victories over Denmark and Austria.

**Fehmarn Belt**. Channel between the Baltic islands of Fehmarn and Maribo. It has a width of about 12 m., and leads from the Baltic to Kiel Bay. Fehmarn Sound is a narrow passage between the island of Fehmarn and the mainland.

**Fehmgericht** (Ger. *Veme*, punishment; *Gericht*, judgement). A medieval German tribunal. Known sometimes as the Holy Vehme, it exercised power, especially in Westphalia, in the 14th and 15th centuries, and is believed to have been a survival from the jurisdictions of the Saxons. The courts were open for trial of civil matters, but might be secret in special cases. It has been estimated that, in the 14th century, the members (*Schöffen* or *Freischöffen*), bound by an all-embracing oath of fidelity, numbered about 100,000.

The government of the tribunal was vested in the king's deputy, the *Stuhlherr*, before whom all members were liable to account for their acts. It had affinity with the process of summary jurisdiction in Anglo-Saxon England, those found guilty of capital offences being hanged, a dagger bearing the secret letters S.S.G.G. being placed on the corpse. As civilization progressed its power waned, to some extent through abuse. The Fehmgericht existed as a sort of minor police court until suppressed by Jerome Bona-

parte in 1811. It was revived in a spurious form by the illegal Free Corps in 1919. Consult Introduction, Anne of Geierstein, W. Scott, 1831.

**Fehrbellin**. Town of Germany, in Brandenburg, 40 m. N.W. of Berlin. Pop. 1,600. It is famous for the great victory gained by the Prussians, then the Brandenburgers, under the Great Elector, over the Swedes, June 18, 1675. A monument marks the site of the battle, which the Prussians regard as a memorable one. It was the beginning of Prussia's military power, as till then the Swedes had been considered all but invincible.

**Feilding**. Town in the North Island of New Zealand. The distributing centre for a large tract of country, it is well laid out around a fine square, and is situated 99 m. N.E. from Wellington by rail. There are dairy factories in the neighbourhood, and the livestock sales are the largest in the North Island. There are also sash and door factories, freezing works, and flour mills. Feilding was a settlement opened in 1874 by an English company represented by Colonel Feilding, and presided over by the duke of Manchester. Pop. 4,700.

**Feilding**, ROBERT (c. 1651-1712). English rake, called Beau Feilding. A member of the Denbigh family, he led a regiment in Ireland for James II. After squandering the fortune of his first wife, a daughter of the 1st viscount Carlingford, he married a daughter of the 1st marquis of Clanricarde. After her death he married, in 1705, Mary Wadsworth, represented to him as a wealthy widow, and in the same year also married the duchess of Cleveland, Charles II's former mistress. In 1706 he was convicted of bigamy. Feilding was satirised by Steele and Swift. He died May 12, 1712.

**Feiling**, KEITH GRAHAME (b. 1884). A British historian. Born Sept. 7, 1884, he was educated at Marlborough and Balliol College, Oxford, received a fellowship at All Souls, and after experience as a lecturer and tutor, including two years at Toronto, 1907-09, was appointed Chichele professor of modern history at his own university in 1946. Feiling specialised in the politics of the 17th century, and also constituted himself the historian of the Conservative tradition in English history. He wrote *History of the Tory Party* (1640-1714), 1924; *What is Conservatism?* 1931; *The Second*

Tory Party (1714-1832), 1938; and the official Life of Neville Chamberlain, 1946.

**Feira de Santa Anna.** Town of Brazil, in the state of Bahia. It is about 30 m. N. of Cachoeira, on the Bahia-S. Francisco rly. The centre of a region rich in minerals, it produces marble, gold, and diamonds. There is trade in cereals, tobacco, and cotton. Cattle fairs are held.

**Feis.** Irish word for an assembly. Something like the folk moots of the Anglo-Saxons, these were mainly meetings for the promulgation of laws by the kings, but they had also a festive element. They were frequently held in Ireland, some being national and others local. The most noted was the feis held regularly at Tara for several centuries until 560. Over it the supreme king presided. The word is still in use; for instance, in 1897 a *feis ceoil* was founded to encourage Irish music.

**Feisal I** (1883-1933). King of Iraq. The third surviving son of Hussein, king of the Hejaz, he was born at Rahab, Arabia, May 20, 1883, but left it when six years old. He spent 18 years in Constantinople (Istanbul), where he received appointments under the

Feisal I,  
King of Iraq  
Russell

Turkish government. Along with his brothers, Ali and Abdullah, he took a leading part in the movement which led to the deposition of Abdul Hamid. He commanded the Arab contingent in the Turkish campaigns in the district S. of Mecca, against a new religious sect which was threatening the stability of the emirate of the Hejaz.

When, in June, 1916, his father sided with the Allies against Turkey in the First Great War, the ameer Feisal commanded the rebels in Medina, but was defeated by the Turks. He then presented to the British a scheme for the formation of an Arab regular army. In conjunction with T. E. Lawrence he advanced in 1917 to Akaba on the border of Syria, and Feisal's army eventually formed Allenby's right wing in Palestine. On Oct. 3, 1918, he led his troops into Damascus. His services in the conquest of Palestine and Syria were rewarded with the privilege of setting up in Amman, Damascus, and Aleppo a

provisional military administration which was guaranteed to the Arabs as an independent sphere by the Sykes-Picot treaty.

Acclaimed king, and for a while *de facto* ruler, of Syria, Feisal represented his father, now ruling over Hejaz, at the peace conference, but was unable to prevent the French demand for a mandate over and occupation of Syria. Again proclaimed king by the

extremists, he was expelled by the French in 1920. Next year he undertook the kingship of Iraq, under the aegis of Great Britain, inaugurating his reign on Aug. 23 after a plebiscite. Feisal settled the country on a firm basis, established good relations with Persia and Turkey, checked the unruly Nationalist element and the Wahabis on the frontier, and secured the acceptance by all parties in 1927 of the Anglo-Iraq treaty, by which his adopted country was to join the League of Nations. Iraq became independent in 1932, but the last year of Feisal's reign was marred by the Assyrian rebellion while he was on a state visit to London. He died Sept. 8, 1933, and was succeeded by his son Ghazi. Though sometimes accused of tortuous diplomacy, Feisal steered his kingdom safely through difficult times. A Life by Mrs. S. Erskine appeared in 1933. See Arabia; Lawrence, T. E.; Palestine, Conquest of.

**Feisal II** (b. 1935). King of Iraq. Born May 2, 1935, he succeeded to the throne on April 4, 1939, on the death of his father, King Ghazi, in a motor accident. Until the king should come of age, Iraq was placed under the regency of his uncle, the ameer Abdul Illah. During the German-inspired Iraqi revolt in April, 1941, the young king was compelled to leave Bagdad, but when the British authorities restored order in June, he and the regent entered the capital in state. At school in England from 1947, he entered Harrow 1949. See Bagdad; Iraq.

**Felanitz** or **FELANICHE**. Town of Spain, in the island of Majorca. It stands in a mt. valley, 23 m. S.E. of Palma, and 7 m. from its port, Puerto Colon. On the mt. of Puig de San Salvador, in the

vicinity, is a Moorish castle with underground vaults. The church of San Miguel is a fine building. Brandy is distilled and soap manufactured. There is trade in cattle, wine, fruit, and earthenware, the water coolers of Felanitx having been noted from the 3rd century B.C. Pop. 11,353.

**Feldspar.** One of the most important groups of rock-forming minerals, consisting essentially of

Feldspar. Huge masses of orthoclase, weighing many tons, at Carne, near Vervan, Cornwall

alumino-silicates of the alkalis. They may be grouped into two main groups, the plagioclase feldspars and the potash feldspars. The plagioclase feldspars form a continuous series, the two end-members being albite (soda-feldspar) and anorthite (lime-feldspar); all mixtures of the two occur and the intermediate minerals are called oligoclase, andesine, labradorite, and bytownite. The soda-rich end of the series is characteristic of acid rocks and lime-bearing varieties of basic rocks. The plagioclase feldspars crystallise in the triclinic system.

The potash feldspars include sanidine, orthoclase, microcline, and adularia. All have the same composition and are monoclinic, with the exception of microcline, which is triclinic. Intergrowths between orthoclase or microcline and soda-rich plagioclase feldspars are known as perthites.

Potash and soda feldspar is used in ceramics for pottery, glazes, etc.; in glass manufacture; abrasives; roofing materials; and false teeth; some stones (Amazon stone, sunstone, and moonstone) are prized as gems. All the commercial deposits occur in pegmatite dykes, mainly associated with granitic rocks. For details of the various types, see Microcline; Moonstone; Orthoclase, etc. See also Crystallography illus.

**Felidae** (Lat. *felis*, cat). Family of the carnivora, or flesh-eating mammals, which includes the cat-like animals. They comprise only

two genera, but a large number of species, and are regarded as the typical carnivores, being the best adapted for catching and preying upon living animals, and, with the exception of the weasels, the most lithe and active of the order.

They are provided with finely developed canine and carnassial teeth and their sharp claws are retractile. One marked feature of the family is the short and rounded muzzle, which is in conspicuous contrast with the long and sharp muzzle in the dogs. Their fur is soft and often handsomely marked, and their feet are provided with cushion-like pads which enable them to move about silently. All are of savage disposition, and only two species have been domesticated with any success. See Cat.

**Felix** (d. c. 647). English saint and bishop. A native of Burgundy, he came to England, and, helped by Sigebert, king of E. Anglia, preached Christianity. Felix became bishop of Dunwich, and is said to have founded the monastery at Soham. His name survives in Felixstowe, Suffolk. His festival is kept on March 8.

**Felix**. Name of four popes and five anti-popes, of whom the following are notable. Felix I (d. 274) is entered in the Roman martyrology probably in mistake for a Roman martyr of the same name buried on the Via Aurelia. A letter of the pope's in response to a report by the synod of Antioch, which had deposed its heretical bishop, Paul of Samosata, was made use of at the council of Ephesus (431). To Felix I, who reigned 269-74, was attributed a decree for the celebration of masses over the tombs of the martyrs. His festival is kept May 30.

Felix II, pope 355-58, was a Roman archdeacon intruded into the papal chair on the banishment of Liberius by the emperor Constantius. On the return of Liberius, Felix was exiled and lived in retirement until his death, Nov. 22, 365. Felix III, pope 483-92, was chiefly engaged in conflicts with heretical bishops at Alexandria and Antioch. Felix IV, pope 526-30, was the nominee of Theodoric the Goth. He obtained an edict from Theodoric's successor ordering all charges against the clergy to be taken to ecclesiastical courts.

Felix V, anti-pope, was born at Chambéry, Dec. 4, 1383. He reigned as duke Amadeus VIII of Savoy 1416-34, when he retired

Felixstowe. The foreshore of this holiday resort popular Suffolk

in favour of his son. In 1439 the remnant of the council of Basel elected him as pope, although he was not in orders, in place of pope Eugenius IV, whom they declared deposed. As Felix V he was crowned in July, 1440. He never obtained general recognition, but with some following in Switzerland and Savoy he held his position till 1449, when he abdicated. He died at Geneva, Jan. 7, 1451, last of the anti-popes.

**Felix Antonius**. Brother of the freedman Pallas, minister of the Roman emperor Claudius. He was procurator of Judaea, but was recalled in A.D. 62 to answer charges of oppression made against him by the Jews. It was before Felix that S. Paul preached at Jerusalem (Acts 23, 24).

**Felix Holt the Radical**. A novel by George Eliot, first published in 1866. It presents in broad effect the life of a midland county during the 1832 Reform period, but there is something unreal about the central figure, who is too philosophical and cold-blooded to represent the enthusiastic reformer of that time.

**Felixstowe**. Health and pleasure resort and residential town of Suffolk, England. Situated in the S.E. corner of the county, it stands on a cliff facing S. between the rivers Deben and Orwell, 11 m. by railway S.E. of Ipswich, and 81 m. from London by road. Its beautiful cliff gardens and sea front, two modern band pavilions, bathing facilities, first-class tennis courts, and opportunities for other sports are among its attractions.

Felixstowe arms

the tourist exploring the Constable country and the Suffolk churches. Here is

the marine aircraft experimental establishment. The town derives its name from that of the 7th century bishop S. Felix. Pop. approx. 14,000.

**Fell** (Scand. *fjeld*, mountain or rock). Term occurring in the names of many British mountains, e.g. Cross Fell, Goat Fell, Snaefell.

**Fell, JOHN** (1625-86). English pedagogue and divine. Born June 23, 1625, he was educated at Christ Church, Oxford, of which he became dean in 1660. Vice-chancellor of the university 1666-69, he was appointed bishop of Oxford in 1675. He notably improved the buildings as well as the discipline of his college, but is chiefly remembered by some lines, "I do not love thee, Dr. Fell," etc., attributed to Thomas Brown (q.v.). He died July 10, 1686.

**Fellah** (plur. Fellahin). Arabic word for peasant-or ploughman, especially in Egypt. Forming the

Fellah. Egyptian sakka or water-carrier

bulk of the native population, the fellahin descend in direct lineage from the ancient Egyptians. They dwell in villages, mainly of mud hovels, under a village chief, the sheikh-el-beled. A wooden statuette, now at Cairo, of a IV dynasty official, found by Mariette at Sakkara, was given that title by the workmen from its likeness to their own headman. Some fellahin are Christian Copts; millions of others adhere to Mahomedanism.

Of medium height, black-eyed, thick-lipped, and straight-nosed, the Semitic and Nubian elements they have absorbed have but slightly affected their racial make-up as a Caucasian people of the Mediterranean type. The progressive deepening of hue from N. to S. marks the influence both of climate and of ethnic contact. The women, who wear head-veils, which expose the antimony-stained eyelashes and tattooed chin, are sometimes wed by the nomad Beduins, but the amount of racial mixture in actual progress is inconsiderable.

Their food is largely vegetable, and they are mostly abstemious. Many of their methods of cereal and pulse cultivation, and of irrigation with water-wheel, sakiya, and balanced bucket, shaduf, are of remote antiquity. The water-carrier, sakka, is often a member of a dervish sect, whose ritual demonstration, zikr, is the occasion of much festivity, wherein quarter-staff, nabut, is a favourite game. The veneration of trees and stones, and the universal employment of amulets, mark the persistence of the predynastic animism of the Nile valley. Those peasants of Palestine also called fellahin are descended from the primitive Canaanite stock. Except for a few colonies introduced under Mehemet Ali they have no ethnic identity with the fellahin of Egypt.

**Fellmonger.** Dealer in the pelts of slaughtered sheep, one who separates the wool from the hides. The skins may be soaked in lime-water until the roots of the fibre are loosened sufficiently to come away with ease, a method which gives the so-called slipped wool. Alternately the skins may be hung in moist air until bacterial action has loosened the fleece, and this is the method adopted in Mazamet, France, the chief centre of fellmongering. Chemical means may be substituted, the flesh side of the hide being painted overnight with a solution of sodium sulphide. *See* Leather.

**Fellow.** Word meaning a male person. It is now used in two senses. In general speech, rarely in a slighting sense, it means a man, and academically it refers to certain members of colleges at Oxford, Cambridge, or elsewhere, and to members of learned societies. The original meaning was that of a companion, hence the phrase fellow-countryman, and this survives in its use at the universities, where it is the equivalent of the Latin *socius*.

In the colleges of Oxford and Cambridge a fellow is a member of the governing body and foundation, and a fellowship is a coveted distinction bestowed on scholars of exceptional ability. Before the reforms of 1877-81 fellows were usually chosen for life, or until marriage. Today they are chosen by the existing fellows, usually for a definite term of years. They may be elected on a reputation or after examination, or because suitable for a particular vacancy on the teaching or managing staff. Many of them act as tutors, and form the group that with the head is responsible for the work of the college.
